Executive Summary

Project Overview

Irma Wind L.P. (the market participant) has submitted a request for system access service to the Alberta Electric System Operator (AESO) to connect its proposed Irma Wind Power Project[1] (the Facility) to the Alberta interconnected electric system (AIES). The Facility consists of approximately 30 wind turbines and a proposed collector station, to be designated the Kinsella 926S substation. The Facility will be located in the Irma area in the AESO planning area of Wainwright (Area 32).

The request for system access service includes a Rate STS, *Supply Transmission Service*, contract capacity of 90 MW and a Rate DTS, *Demand Transmission Service*, contract capacity of 3 MW for new system access service in the area, and a request for transmission development (collectively, the Project).

The scheduled in-service date (ISD) for the Project is July 1, 2019.

This report details the engineering studies undertaken to assess the impact of the Project on the performance of the Alberta interconnected electric system (AIES).

Existing System

Geographically, the Project is located in the AESO planning area of Wainwright (Area 32), which is part of the AESO Central Planning Region. Wainwright (Area 32) is surrounded by the AESO planning areas of Alliance/Battle River (Area 36), Provost (Area 37), Vegreville (Area 56), and Lloydminster (Area 13).

From a transmission perspective, Wainwright (Area 32) is connected to Lloydminster (Area 13), Alliance/Battle River (Area 36), and Provost (Area 37) through the 138/144 kV transmission system. There is a 240 kV connection to Provost (Area 37) and Alliance/Battle River (Area 36), as well. Wainwright (Area 32) and its surrounding planning areas are mainly load centres. These areas are collectively a generation rich region. There are different types of generation plants that supply those areas. This includes cogeneration facilities in Cold Lake (Area 28); coal generation facilities in Alliance/Battle River (Area 36); and wind generating facilities in Hanna (Area 42) and Provost (Area 37).

There are a number of existing constraints in the area that are mitigated by remedial action schemes (RASs). Following RAS activation, these constraints are managed in accordance with the procedures set out in Section 302.1 of the ISO rules, *Real Time Transmission Constraint Management* (TCM Rule).

Study Summary

Study Area for the Project

The Study Area consists of the following AESO planning areas: Lloydminster (Area 13), Wainwright (Area 32), Alliance/Battle River (Area 36), Hanna (Area 42), Provost (Area 37), Vegreville (Area 56), and Cold Lake (Area 28). The Study Area also includes the tie lines connecting these planning areas to neighbouring planning areas. The Study Area is served by 240 kV, 138/144 kV, and 69/72 kV transmission systems. All transmission facilities within the

[1] Irma Wind Limited Partnership, by its general partner, Irma Wind GP Inc. filed its power plant application for the proposed Irma Wind Power Project with the Alberta Utilities Commission in AUC Proceeding 22722 and Application Number 22722-01, which was registered on June 9, 2017.

Study Area were studied and monitored to assess the impact of the Project on the AIES, including any violations of the Reliability Criteria (as defined in Section 2.1.1).

Analyses Performed for the Project

The following studies were performed in the connection assessment assuming base case generation dispatch (economic coal and high wind) conditions:

- Power flow studies (Category A and Category B): 2017 Summer Peak (SP) and 2017 Summer Light (SL) pre-Project and post-Project scenarios.
- Transient stability studies (Category A and Category B): 2017 SL and 2017 SP post-Project scenarios.
- Short-circuit studies (Category A): 2017 Winter Peak (WP) pre-Project scenario, 2017 WP post-Project, and 2025 WP post-Project scenarios.

In addition, the following sensitivity dispatch scenarios were performed to determine if there were any Reliability Criteria violations under Category A for simultaneous high coal and high wind generation dispatch conditions:

- Power flow studies (Category A): 2017 SP and 2017 SL High Coal pre-Project and post-Project scenarios.

Results of the pre-Project Studies

The following is a summary of the pre-Project study results.

Category A conditions:

Under Category A conditions, no Reliability Criteria violations were observed for the base case study scenario or the sensitivity study scenarios.

Category B conditions:

The pre-Project power flow studies identified a number of system performance issues, namely thermal criteria violations, under Category B conditions as shown in Table E-1 below.

Connection alternatives examined for the Project

The AESO, in consultation with the TFO and the market participant, examined two alternatives to respond to the market participant's request for system access service. All alternatives involve connecting the Facility to the AIES through the market participant's proposed Kinsella 926S substation.

Alternative 1 – In-and-out connection to the 144 kV transmission line 7L50: Connect the proposed Facility to the 144 kV transmission line 7L50 (between the Buffalo Creek 526S substation and the Jarrow 252S tap point) using an in-and-out configuration. This would require the addition of two 144 kV circuits, each approximately 0.2 km long, and a switching station with a minimum of three 144 kV circuit breakers.

Alternative 2 – Radial connection to the Buffalo Creek 526S substation: Connect the proposed Facility to the Buffalo Creek 526S substation. This alternative would require a new 138 kV circuit approximately 16 km long and a 138 kV circuit breaker at the Buffalo Creek 526S substation.

Connection alternatives selected for further examination

Of the two potential transmission connection alternatives examined, only Alternative 2 was selected for further study. If Alternative 1 were chosen, the maximum generation output for the Facility would be 20 MW under Category A conditions. This is much lower than the market participant's requested Rate STS contract capacity of 90 MW.

Results of the post-Project studies

The following is a brief summary of the post-Project studies results.

Category A conditions:

Under Category A conditions, no Reliability Criteria violations were observed for the base case study scenarios or the sensitivity study scenarios.

The short-circuit analysis concludes that the Project connection will not adversely change the short circuit levels at the nearby substations.

Category B conditions:

Under Category B conditions, no voltage criteria violations or voltage deviations were observed in this scenario.

Similar to the pre-Project scenarios, power flow studies identified a number of system performance issues, namely thermal criteria violations. These violations are shown in Table E-1 below.

The results did not indicate any transient stability concerns, and the system remains stable following all studied Category B contingencies in the Study Area.

Conclusions and Recommendation

Analysis and Conclusions

Table E-1 provides analysis of, and conclusions about, the impact of the Project for the Category B conditions where violations were observed, including recommended mitigation measures for the observed Reliability Criteria violations.

Table E – 1 Summary of Reliability Criteria Violations, Project Impact and Mitigation Measures

Reliability Criteria Violations		Scenario	Pre-Project		Post-Project	
Violation	Contingency		Thermal Violation Type	Mitigation Measures	Thermal Violation Type	Mitigation Measures

Several thermal violations*	Metiskow 648S transformer T1 (648ST1)	2017 SP and SL	Above short term rating	Real time Operational practices	Above short term rating	Real time operational practice

* The Metiskow 648S substation transformer, T1 (648ST1) contingency is a known existing system issue and the violation associated with the contingency will be managed using real-time operational practices. The results for this contingency have not been included in this report. The Project has no impact on these violations.

Based on the study results, Alternative 2 is technically viable. The connection assessment identified a number of pre-Project and post-Project system performance issues.

Real-time operational practices and existing and planned RASs can be used to mitigate most of the pre-Project and post-Project system performance issues. The existing RAS #138, used to address pre-Project system performance issues, will not be needed after the Project is connected.

As shown in Table E-1, a new RAS is required to mitigate the observed thermal criteria violations on the 144 kV transmission line 7L129 under certain Category B conditions. It is anticipated that the requirement for the proposed new RAS will be removed by the Provost to Edgerton and Nilrem to Vermilion Transmission System Reinforcement (PENV) project.[2] The target in-service date for the PENV project is Q1 2021.

The Project connection using Alternative 2 will require the addition of a 138 kV circuit and a 138 kV circuit breaker at the Buffalo Creek 526S substation.

Recommendation

It is recommended to proceed with the Project using Alternative 2 as the preferred alternative to respond to the market participant's request for system access service, and a new RAS for the 144 kV transmission line 7L129.

A new RAS is required to mitigate the observed thermal criteria violations on the 144 kV transmission line 7L129 under certain Category B conditions. It is also recommended that real-time operational practices and the planned Hand Hills RAS be used to mitigate the other identified post-Project system performance issues. The existing RAS #138 will not be needed following the Project connection.

A minimum rating of 100 MVA is recommended for the new 138 kV circuit (between the proposed Facility and the existing Buffalo Creek 526S) and is consistent with good electric industry practice.

[2] The PENV project was filed with the AUC on December 12, 2016 in Proceeding No. 22274 and Application No. 22274-A001.

1. Introduction

This report details the engineering studies undertaken to assess the impact of the Project (as defined below) on the performance of the Alberta interconnected electric system (AIES).

1.1. Project

1.1.1. Project Overview

Irma Wind L.P. (the market participant) has submitted a request for system access service to the Alberta Electric System Operator (AESO) to connect its proposed Irma Wind Power Project[3] (the Facility) to the Alberta interconnected electric system (AIES). The Facility consists of approximately 30 wind turbines and a proposed collector station, to be designated the Kinsella 926S substation. The Facility will be located in the Irma area in the AESO planning area of Wainwright (Area 32).

The request for system access service includes a Rate STS, *Supply Transmission Service*, contract capacity of 90 MW and a Rate DTS, *Demand Transmission Service*, contract capacity of 3 MW for new system access service in the area, and a request for transmission development (collectively, the Project).

The scheduled in-service date (ISD) for the Project is July 1, 2019.

1.1.2. Load Component

The Project includes a load component:

- Rate DTS requested: 3 MW
- Load type: Substation service and auxiliary load

1.1.3. Generation Component

The Project includes the following generation component:

- Rate STS requested: 90 MW
- Maximum Authorized Real Power (MARP): 90 MW
- Maximum Capability (MC): 90 MW
- Type of generator: Wind
- Power factor assumed: 0.9 power factor (PF) lagging and 0.95 PF leading is assumed for the Facility output as measured at the generating unit terminal, per the technical requirements of Section 502.1 of the ISO rules, *Wind Aggregated Generating Facilities Technical Requirements*

[3] Irma Wind Limited Partnership, by its general partner, Irma Wind GP Inc. filed its power plant application for the proposed Irma Wind Power Project in Proceeding 22722 and Application Number 22722-01, which was registered on June 9, 2017.

- Future expansion planned: the market participant has advised the AESO that it does not currently have future expansion plans for the Facility.

1.2. Study Scope

1.2.1. Study Objectives

The objectives of the studies were as follows:

- Assess the impact of the Project on the performance of the AIES.
- Evaluate the Project connection alternatives based on technical performance.
- Identify any violations of the relevant AESO criteria, standards or requirements, both pre- and post-Project.
- Recommend any mitigation measures to address system performance concerns, if any, to enable the reliable connection of the Project to the AIES.

1.2.2. Study Area

Geographically, the Project is located in the AESO planning area of Wainwright (Area 32), which is in the Central Planning Region. Wainwright (Area 32) is surrounded by the AESO planning areas of Lloydminster (Area 13), Vegreville (Area 56), Provost (Area 37) and Alliance/Battle River (Area 36).

From a transmission perspective, Wainwright (Area 32) is connected to Provost (Area 37), Lloydminster (Area 13), and Alliance/Battle River (Area 36) through the 138/144 kV transmission system. There is a 240 kV connection to Provost (Area 37) and Alliance/Battle River (Area 36), as well.

Wainwright (Area 32) and its surrounding planning areas are mainly load centres. All these areas collectively make the region a generation rich region. There are different types of generation plants that supply those areas. This includes cogeneration facilities in Cold Lake (Area 28); coal generation facilities in Alliance/Battle River (Area 36); and wind generating facilities in Hanna (Area 42) and Provost (Area 37).

1.2.2.1. Study Area Description

The Study Area consists of the following AESO planning areas: Lloydminster (Area 13), Wainwright (Area 32), Provost (Area 37), Alliance/Battle River (Area 36), Vegreville (Area 56), Hanna (Area 42), and Cold Lake (Area 28). The Study Area also includes the tie lines connecting these planning areas to neighbouring planning areas. Figure 1-1 shows the transmission system configuration in the Study Area.

The Study Area is served by 240 kV, 138/144 kV, and 69/72 kV transmission systems.

The AESO has published the *AESO 2015 Long-term Transmission Plan*[4] (2015 LTP) in which a summary of the Central Region plan in the near term is provided. Figure 1-2 and Table 1-1 show the near-term plan in the vicinity of the Study Area. The near-term plans have scheduled ISDs expected by 2020.

[4] The 2015 Long-term Transmission Plan is available on the AESO website.

1.2.2.2. Existing Constraints

Existing constraints in the Study Area are managed in accordance with Section 302.1 of the ISO rules, *Real Time Constraint Management (*TCM Rule). The remedial action schemes (RASs) that are being used to mitigate certain existing constraints in the Study Area, are listed below:

1. Battle River 7L50 and 7L701 Thermal Protection Scheme (TPS)
2. RAS #134: 174L-395S North Holden overload mitigation scheme
3. RAS #138: 7L50 -526S Buffalo Creek overload mitigation scheme
4. RAS #139: 901T-766S Nevis overload mitigation scheme
5. HVDC RAS: EATL RAS for 912L and 9L20 contingencies

1.2.2.3. AESO Long-Term Transmission Plans

The 2015 LTP identifies system transmission developments in the vicinity of the Study Area in the near-term, medium-term, and long-term. Included for reference, Table 1-1 lists the near-term system developments in the vicinity of the Study Area that are included in the 2015 LTP.[5]

Table 1-1: 2015 LTP near term components in the Vicinity of the Study Area

Time Frame	Development
Near-term	• Add voltage reinforcement at Strome substation east of Camrose, Irish Creek substation north of Kitscoty and Whitby Lake substation near Vilna • Add new 240/144 kV substation near Vermilion • Add new 240 kV line from Tinchebray substation northeast of Halkirk to new substation near Vermilion energized at 144 kV • Reconfigure 144 kV lines in vicinity of Vermilion to terminate at new substation • Add new 240 kV line from Hansman Lake substation southeast of Hughenden to Edgerton substation energized at 144 kV • Rebuild 144 kV line from Vermilion to Irish Creek to higher capacity

1.2.3. Studies Performed

The following studies were performed for pre-Project scenarios:

- Power flow
- Short-circuit

The following studies were performed for post-Project scenarios:

- Power flow
- Transient stability
- Short-circuit

[5] The 2015 LTP identifies the near-term transmission developments in the Study Area on page 44.

1.3. Report Overview

The Executive Summary provides a high-level summary of the assessment and its conclusions. Section 1 provides an introduction of the Project and the Study Area. Section 2 describes the criteria, system data, and other study assumptions used in the studies. Section 3 describes the methodology used for the studies. Section 4 discusses the pre-Project study results. Section 5 presents the connection alternatives that were examined. Section 6 presents the post-Project study results for the alternative that was selected for further study. Section 7 presents the sensitivity study results. Section 8 provides the results of the short-circuit studies and analysis. Section 9 discusses the Project dependencies, if any. Section 10 presents the conclusions and recommendations of the Project connection assessment.

2. Criteria, System Data, and Study Assumptions

2.1. Criteria, Standards, and Requirements

2.1.1. Transmission Planning Standards and Reliability Criteria

The Transmission Planning (TPL) Standards, which are included in the Alberta Reliability Standards, and the AESO's *Transmission Planning Criteria – Basis and Assumptions*[6] (collectively, the Reliability Criteria) were applied to evaluate system performance under Category A system conditions (i.e., all elements in-service) and following Category B contingencies (i.e., single element outage), prior to and following the studied alternatives. Below is a summary of Category A and Category B system conditions.

Category A, often referred to as the N-0 condition, represents a normal system with no contingencies and all facilities in service. Under this condition, the system must be able to supply all firm load and firm transfers to other areas. All equipment must operate within its applicable rating, voltages must be within their applicable range, and the system must be stable with no cascading outages.

Category B events, often referred to as an N-1 or N-G-1 with the most critical generator out of service, result in the loss of any single specified system element under specified fault conditions with normal clearing. These elements are a generator, a transmission circuit, a transformer, or a single pole of a DC transmission line. The acceptable impact on the system is the same as Category A. Planned or controlled interruptions of electric supply to radial customers or some local network customers, connected to or supplied by the faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted firm (non-recallable reserved) transmission service electric power transfers.

The TPL standards, TPL-001-AB-0 and TPL-002-AB-0, have referenced Applicable Ratings when specifying the required system performance under Category A and Category B events. For the purpose of applying the TPL standards to the studies documented in this report, Applicable Ratings are defined as follows:

- Seasonal continuous thermal rating of the line's loading limits.
- Highest specified loading limits for transformers.
- For Category A conditions: Voltage range under normal operating conditions follows the AESO Information Document # 2010-007RS, *General Operating Practices – Voltage Control* (ID #2010-007RS). ID #2010-007RS relates to Section 304.4 of the ISO rules, *Maintaining Network Voltage*. For the busses not listed in ID #2010-007RS, Table 2-1 in the *Transmission Planning Criteria – Basis and Assumptions* applies.
- For Category B conditions: The extreme voltage range values per Table 2-1 in the *Transmission Planning Criteria – Basis and Assumptions*.
- Desired post-contingency voltage change limits for three defined post event timeframes as provided in Table 2-1.

[6] Filed under a separate cover.

Table 2-1: Post Contingency Voltage Deviation Guidelines for POD Low Voltage Busses

Parameter and reference point	Time Period		
	Post Transient (up to 30 sec)	Post Auto Control (30 sec to 5 min)	Post Manual Control (Steady State)
Voltage deviation from steady state at POD low voltage bus	±10%	±7%	±5%

2.1.2. ISO Rules and Information Documents

AESO ID #2010-007RS was applied to establish pre-contingency voltage profiles in the Study Area. The TCM Rule was followed in setting up the study scenarios and assessing the study results.

The Reliability Criteria is the basis for planning the AIES. In addition, due regard was given to the AESO's Connection Study Requirements Document and the AESO's Generation and Load Interconnection Standard.

2.1.3. Other Requirements

Wind Aggregated Generation Facility (WAGF) Requirements

The Facility should meet the technical requirements presented in Section 502.1 of the ISO rules, *Wind Aggregated Generating Facilities Technical Requirements*.

2.2. Study Scenarios

At time of study, the scheduled ISD for the Project was December 31, 2016. As a result, the studies were performed using 2017 study scenarios. The scheduled ISD has since been revised from December 31, 2016 to July 1, 2019. The shift in the scheduled ISD would not materially impact the results of this connection assessment, and would not change the conclusions and recommendations contained in this report.

The Project's requested Rate DTS of 3 MW is not significant compared to the load in the Study Area, which is in a generation rich area, hence it was not considered in this study.

Table 2-2 lists the scenarios considered for the Project connection study's power flow and transient stability analyses. Summer loading scenarios, both summer light (SL) and summer peak (SP), were selected since they provide the most stressed operating condition. This is because the Study Area has low load variation between winter and summer seasons and the transmission facilities in the Study Area have summer ratings that are significantly lower than the winter ratings.

Table 2-2: List of the Connection Study Scenarios

Year/Season	Condition	Project Load (MW)	Project Generation (MW)	System Generation Dispatch Conditions
2017 SL	Pre-Project	0	0	High Wind, Economic Coal
2017 SP	Pre-Project	0	0	High Wind,

Year/Season	Condition	Project Load (MW)	Project Generation (MW)	System Generation Dispatch Conditions
				Economic Coal
2017 SL	Post-Project	0^	90	High Wind , Economic Coal
2017 SP	Post-Project	0	90	High Wind, Economic Coal

^The load component of the Project is not material and; therefore, was not assessed

2.3. Load and Generation Assumptions

2.3.1. Load Assumptions

The relevant AESO regional planning load forecasts used for this connection assessment are shown in Table 2-3. The forecasts are based on the *AESO 2014 Long-term Outlook* (2014 LTO). As part of its planning responsibilities, the AESO updates its corporate forecasts routinely to ensure they reflect the latest economic projects, factors and timing. While the AESO has updated its regional forecasts since the connection studies were performed, the use of the current AESO forecast, the *AESO 2017 Long-term Outlook*, would not materially alter the connection study results or affect the conclusions and recommendations in this report.

For the studies, when loads are modified to align with the load forecast in the 2014 LTO, the active power to reactive power ratio in the base case scenarios were maintained.

Table 2-3: Forecast Area Load *(2014 LTO at Alberta Internal Load (AIL) Peak)*

Area or Region Name	Year/Season Load	Forecast Peak Load (MW)
Central Region	2017 SP	1,632
	2017 SL	1,174
AIL w/o Losses	2017 SP	11,440
	2017 SL	8,245

2.3.2. Generation Assumptions

The existing non-wind generators and their dispatch levels in the Study Area are listed in Table 2-4. This dispatch level was used for the economic coal dispatch condition for the Study Area.

The existing wind generators and their dispatch are listed in Table 2-5. The remaining forecasted wind growth is allocated to planned wind projects in the Central region as identified in Table 2-6. The forecast wind growth is based on the 2014 LTO with a variance to capture an uncertainty around the timing of future wind projects.

The wind dispatch level included all existing and future wind generation dispatched up to their contracted MC level. These dispatch assumptions were used for the high wind dispatch condition for the Study Area.

Table 2-4: Non-Wind Generation (MW) in the Study Area

Existing/ Future	Unit Name	AESO Planning Area	2017 SP Unit Net Generation* (MW)	2017 SL Unit Net Generation (MW)
Existing	Battle River #3	36	122.0	91.4
Existing	Battle River #4	36	128.0	98.0
Existing	Battle River #5	36	307.0	157.0
Existing	Sheerness #1	43	144.3	144.3
Existing	Sheerness #2	43	144.3	144.3

*The *Grizzly Bear Creek Wind Power Connection* NID, as originally approved by AUC Decision 21643-D01-2016 and Approval 21643-D02-2016.

***The Suncor Hand Hills Wind Energy Connection NID, as originally approved by AUC Decision 2482-D01-2015 and Approval 2482-D03-2015.*

***The *BluEarth Hand Hills Wind Energy Connection* NID, as originally approved by AUC Decision 2482-D01-2015 and Approval 2482-D02-2015.

2.3.3. Intertie Flow Assumptions

Intertie assumptions are included for the British Columbia-Alberta (BC-AB), Saskatchewan-Alberta (SK-AB), and Montana-Alberta (MATL) interties. Details on the assumptions can be found in Table 2-7. These export and import assumptions coincide with high export, which is used for 2017 SL pre-Project and post-Project scenarios, and high import, which is used for 2017 SP pre-Project and post-Project scenarios.

Table 2-7: Intertie Assumptions

Scenario	Intertie		
	Import (-) /Export (+) to BC-AB (MW)	Import (-) /Export (+) to SK-AB (MW)	Import (-) /Export (+) to MATL (MW)
2017 SL (High Export)	700	150	300
2017 SP (High Import)	-900	-150	-300

2.3.4. HVDC Power Order

The 500 kV high voltage DC (HVDC) power orders were set based on the reduced system loss assumptions in pre-Project and post-Project study scenarios, as shown in Table 2-8.

Table 2-8: 500 kV HVDC Power Order by Scenario

Scenario	Western Alberta Transmission Line* (MW)	Eastern Alberta Transmission Line** (MW)
2017 SL Pre-Project	475 (S → N)***	Blocked
2017 SP Pre-Project	250 (S → N)	450 (S → N)
2017 SL Post-Project	475 (N → S)	Blocked
2017 SP Post-Project	250 (S → N)	800 (S → N)

*Western Alberta Transmission Line (the west 500 kV HVDC line)

**Eastern Alberta Transmission Line (the east 500 kV HVDC line)

****N → S: HVDC flow direction is North to South, S → N: HVDC flow direction is South to North*

2.4. System Projects

2015 LTP system transmission projects were not considered in the system topology for the study scenarios because these transmission developments are not expected to be in service before the scheduled Project ISD.

2.5. Customer Connection Projects

Customer connection projects within the Study Area that have passed Gate 2 of the AESO Connection Process as of July 2017 were modelled in the study scenarios bases on their positions in the AESO Connection Queue unless otherwise indicated. Table 2-9 summarizes the customer connection project assumptions that were used in the studies. Information in this table is subject to change as projects progress.

Table 2-9: Summary of Customer Connection Projects Included in the Study

AESO Planning Area	Queue Position*	Scheduled ISD	Project Name	AESO Project No.	Generation (MW)	Load (MW)
42	6	Sep 1, 2019	Suncor Hand Hills Wind Energy Project	635	80.0	0.0
42	7	Sep 1, 2019	BluEarth Hand Hills Wind Project	678	80.0	1.0
37	9	Dec 31, 2017	TransCanada Keystone KXL Pump station #2-Eyre	851	0.0	0.0
37	10	Dec 31, 2017	TransCanada Keystone KXL Pump station #2-Eyre Phase 2	851	0.0	25.0
42	11	Dec 31, 2017	TransCanada Keystone KXL Pump station #3-Current	863	0.0	25.0
42	12	Dec 31, 2017	TransCanada Keystone KXL Pump station #4-Armitage	864	0.0	25.0

* Per the AESO Connection Queue posted in July 2017.

2.6. Facility Ratings and Shunt Elements

The legal owner of transmission facilities (TFO) provided the ratings of existing transmission lines and existing transformers in the Study Area. The seasonal continuous ratings and short-term ratings for the key transmission lines in the Study Area are shown in Table 2-10. The key transformers in the Study Area are shown in Table 2-11.

Table 2-10: Summary of Key Transmission Line Ratings in the Study Area (*MVA on 138 kV Base*)

9L953	Cordel 755S - Nilrem 574S	240	498.0 CT (520.0)	498.0 CT (663.0)	498.0 CT	498.0 CT

* "CT" indicates that the transmission line is limited by current transformer.

** The values in brackets represent the transmission lines' ratings if the current transformer limits were removed.

*** The line is currently de-rated. The TFO has informed the AESO of the 2017 date to restore the line to its normal rating.

Transmission lines that start with 7Lxx are operated at 144 kV voltage.

^When line loading in post Category B contingency is observed to exceed nominal rating and is less than the short-term rating (emergency), it is assumed that AESO and TFO real-time operational practices can manage the constraint within the time requirements of TFO short time (emergency) rating.

Table 2-11: Summary of Key Transformer Ratings in the Study Area

Substation Name and Number	Transformer ID	Transformer Voltages (kV)	Rating (MVA)
Battle River 757S	912T	240/144	224
Battle River 757S	701T	144/72	75
Nevis 766S	901T	240/144	100
Nevis 766S	701T	144/72/25	H-M: 33.3 X-M: 33.3 Y-M: 16.6
Nilrem 574S	T1	240/138	400
Nilrem 574S	T2	240/138	400

The details of key shunt elements in the Study Area are given in Table 2-12.

Table 2-12: Summary of Key Shunt Elements in the Study Area

Substation Name and Number	Voltage Class (kV)	Capacitors				Reactors			
		Number of Switched Shunt Blocks	Total at Nominal Voltage (MVAr)	Status in Study (on or off)		Number of Switched Shunt Blocks	Total at Nominal Voltage (MVAr)	Status in Study (on or off)	
				2017 SL (MVAr)	2017 SP (MVAr)			2017 SL (MVAr)	2017 SP (MVAr)
Buffalo Creek 526S	138	1 x 15.00 MVAr	15.00	on	on

2.7. Dynamic Data and Assumptions

The Project Data Update Package (PDUP) *Type 3* wind machine generic models were used to model the wind turbines for the Facility. The model details are provided in Attachments E and F.

2.8. Protection Fault Clearing Times

Actual fault clearing times for existing facilities were provided by the TFO and are listed in Table 2-13.

Table 2-13: Summary of Protection Fault Clearing Times

Line	Voltage Class (kV)	Terminal Location			Faulted Location	Total Clearing Time		
		Terminal 1	Terminal 2	Terminal 3		Terminal 1	Terminal 2	Terminal 3

2.9. Voltage Profile Assumptions

AESO ID #2010-007RS was used to establish normal system (i.e., pre-contingency) voltage profiles for key area busses prior to commencing any studies. Table 2-1 of the *Transmission Planning Criteria – Basis and Assumptions* applies for all the busses not included in the AESO ID #2010-007RS. These voltages were used to set the voltage profile for the study base cases prior to power flow studies.

3. Study Methodology

3.1. Connection Studies Carried Out

The studies to be carried out for this connection study are identified below in Table 3-1. All studies were performed using PSS/E v33.

Table 3-1: Summary of Studies Performed

Scenario	Project		System Conditions	Power flow	Transient Stability	Short-circuit
	Load (MW)	Generation (MW)				
2017 SL Pre-Project	0	0	Category A and Category B	X		
2017 SP Pre-Project	0	0	Category A and Category B	X		
2017 SL Post-Project	0	90	Category A and Category B	X	X	
2017 SP Post-Project	0	90	Category A and Category B	X	X	
2017 SL High Coal Pre-Project*	0	0	Category A	X		
2017 SP High Coal Pre-Project*	0	0	Category A	X		
2017 SL High Coal Post-Project*	0	90	Category A	X		
2017 SP High Coal Post-Project*	0	90	Category A	X		
2017 Winter Peak (WP) Pre-Project**	0	0	Category A			X
2017 WP Post-Project**	0	90	Category A			X
2025 WP Post-Project**	0	90	Category A			X

* Sensitivity studies (as discussed in Section 3.4)
**Short-circuit study methodology is described in Section 3.5

3.2. Power Flow Analysis

Pre-Project and post-Project power flow studies were conducted to identify and compare study scenario thermal and voltage criteria violations as per the Reliability Criteria in the Study Area, and to identify any POD low voltage bus deviations from the limits listed in Table 2-1.

For the Category B power flow studies, the transformer taps and switched shunt reactive compensating devices such as shunt capacitors and reactors were locked and continuous shunt devices were enabled.

POD low voltage bus deviations were assessed for both the pre-Project and post-Project networks by first locking all tap changers and area shunt reactive compensating devices to identify any post transient voltage deviations above 10%. Second, tap changers were allowed to move while shunt reactive compensating devices remained locked to determine if any voltage deviations above 7% would occur in the area. Third, all the taps and shunt reactive compensating devices were allowed to adjust, and voltage deviations above 5% would be reported.

3.2.1. Contingencies Studied

Power flow analysis was performed for the Category A conditions and all Category B contingencies in the Study Area for all pre- and post-Project scenarios.

3.3. Transient Stability Analysis

Transient stability analysis for selected Category B contingencies was performed using the 2017 SL and SP post-Project scenarios. The contingency list and the fault clearing times are shown in Table 2-13. These disturbances cover all the major transmission lines in the Study Area. The active power of the generation units, speed, bus voltages, frequencies and angles are monitored for selected busses in the Study Area.

3.4. Sensitivity Studies

To assess whether there are any Reliability Criteria violations under Category A conditions assuming simultaneous high dispatch of both wind and coal generation in the Study Area, a sensitivity study was performed using a high wind, high coal and high import (for 2017 High Coal SP) or high export (for 2017 High Coal SL) pre-Project and post-Project scenarios. In this sensitivity scenario the coal units in the Central Planning Region are dispatched to their MCs (net-to-grid) as shown in Table 3-2, and the list of sensitivity scenario cases are as shown in Table 3-3.

Table 3-2: High Coal Generation (MW) in the Study Cases

Existing/Future	Unit Name	AESO Planning Area	2017 SP Unit Net Generation (MW)	2017 SL Unit Net Generation (MW)
Existing	Battle River #3	36	149.0	149.0
Existing	Battle River #4	36	155.0	155.0
Existing	Battle River #5	36	385.0	385.0
Existing	Sheerness #1	43	390.0	390.0
Existing	Sheerness #2	43	390.0	390.0

Table 3-3: High Coal Scenario Cases

Scenario	Project Load (MW)	Project Generation (MW)	System Generation Dispatch Conditions
2017 SL High Coal Pre-Project	0	0	High Wind , High Coal
2017 SP High Coal Pre-Project	0	0	High Wind , High Coal
2017 SL High Coal Post-Project	0	90	High Wind , High Coal
2017 SP High Coal Post-Project	0	90	High Wind , High Coal

3.5. Short-Circuit Analysis

Short-circuit analysis was performed for the 2017 WP pre-Project and post-Project scenarios, as well as for the future ten-year system using the 2025 WP post-Project scenario. Winter peak scenarios were used for short-circuit analysis because winter peak scenarios produce higher short-circuit current levels than summer peak scenarios.

A maximum fault level is provided for the substations in the vicinity of the Project assuming normal system operation with all transmission elements in service and generation dispatched. Three-phase faults and single line to ground fault was simulated. Polar coordinates and per unit values was used for reporting the results.

Maximum fault level was provided for the following substations:

- Battle River 757S
- Buffalo Creek 526S
- Irish Creek 706S
- Proposed Kinsella 926S
- Lloydminster 716S
- Vermillion 710S
- Vincent 2019S
- Vegreville 709S

4. Pre-Project System Assessment

4.1. Pre-Project Power Flow Studies

This section provides the results for the pre-Project power flow studies. The analysis of these results, including mitigations for observed Reliability Criteria violations, is provided in Section 10. All power flows are based on 138 kV system voltage. The results of the steady state analysis are illustrated by the plots in Attachments A and B, respectively. The pre-Project constraint summary table is provided in Attachment H.

4.1.1. 2017 Summer Light (2017 SL pre-Project)

The 2017 SL pre-Project scenario study results are summarized below and the related power flow diagrams are provided in Attachment A.

Category A Condition

No Reliability Criteria violations were observed in this scenario under the Category A condition.

Category B Conditions

Neither voltage criteria violations nor POD (low voltage) bus voltage deviations were observed in this scenario under Category B conditions.

Thermal loading above seasonal continuous ratings and short-term ratings were observed as shown in Table 4-1. The red shaded cells show the loading above the short-term rating.

Table 4-1: Summary of Thermal Criteria Violations Under Category B Conditions for 2017 SL Pre-Project

Contingency	Limiting Branch	Seasonal Continuous Rating (MVA)	Short-term Rating (MVA)	Pre-Project	
				Power flow (MVA)	% Loading
9L29 (Oakland 946S - Coyote Lake 963S)	7L128 (Coyote Lake 963S - Michichi Creek 802S)	94.9	94.9	153.3	161.5
	7L159 (Ghost Pine 114S tap point - Heatburg 948S)	94.9	94.9	118.7	125.1
	7L16 (Nevis 766S - Heatburg 948S)	94.9	94.9	114.5	120.7
	7L85 (Bullpound 803S - Anderson 801S)	94.9	94.9	120.7	127.1
	7L85 (Wintering Hills 804S - Bullpound 803S)	94.9	94.9	126.9	133.7

4.1.2. 2017 Summer Peak (2017 SP pre-Project)

The 2017 SP pre-Project power flow study results are summarized below and the related power flow diagrams are provided in Attachment B.

Category A Condition

No voltage criteria violations or thermal criteria violations were observed in this scenario under the Category A condition.

Category B Conditions

No voltage criteria violations or voltage deviations were observed in this scenario under Category B conditions.

Thermal loading above seasonal continuous ratings and short-term ratings were observed. All observed thermal criteria violations are listed in Table 4-2. The red shaded cells show the loading above the short-term rating and the green shaded cells show the loading above the seasonal continuous rating and below the short-term rating.

Table 4-2: Summary of Thermal Criteria Violations Under Category B Conditions for 2017 SP Pre-Project

Contingency	Limiting Branch	Seasonal Continuous Line Rating (MVA)	Short-term Rating (MVA)	Pre-Project	
				Power flow (MVA)	% Loading
North Holden 395S Transformer 1 (295ST1) *	7L129 (Buffalo Creek 526S - Bauer 918S tap point)	109.2	123.6	113.2	103.6

*Lack of transformer breaker will trip the lines connected to this transformer

5. Connection Alternatives

5.1. Overview

The AESO, in consultation with the TFO and the market participant, examined two connection alternatives to respond to the market participant's request for system access service. Details of these alternatives are presented below.

The proposed Facility will include a 34.5/138 kV collector substation, to be designated the Kinsella 926S substation.

5.2. Connection Alternatives Identified

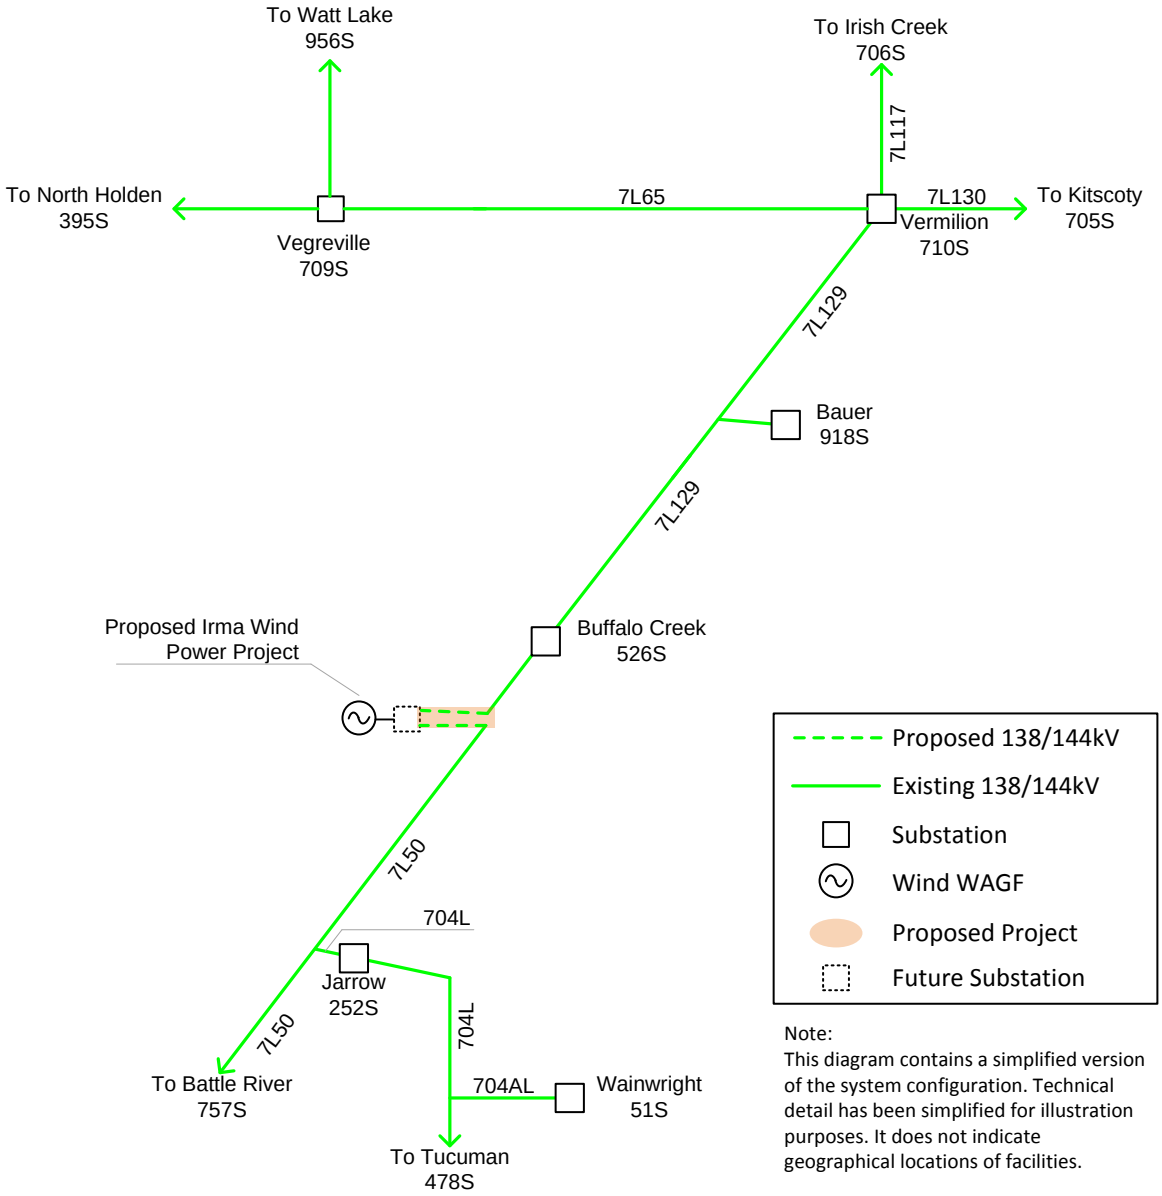
The major transmission development required for the two connection alternatives examined are described below.

Alternative 1 – In-and-out connection to the 144 kV transmission line 7L50:

Connect the proposed Facility to the 144 kV transmission line 7L50 (between the Buffalo Creek 526S substation and the Jarrow 252S tap point) using an in-and-out configuration as shown in Figure 5-1. This alternative would require the addition of two 144 kV circuits, each approximately 0.2 km long, and a switching station with a minimum of three 144 kV circuit breakers.

As a result of existing capacity limits on the 138/144 kV system in the area, the maximum generation output for the Facility would be 20 MW under Category A conditions for this connection alternative. This is much lower than the market participant's Rate STS request of 90 MW.

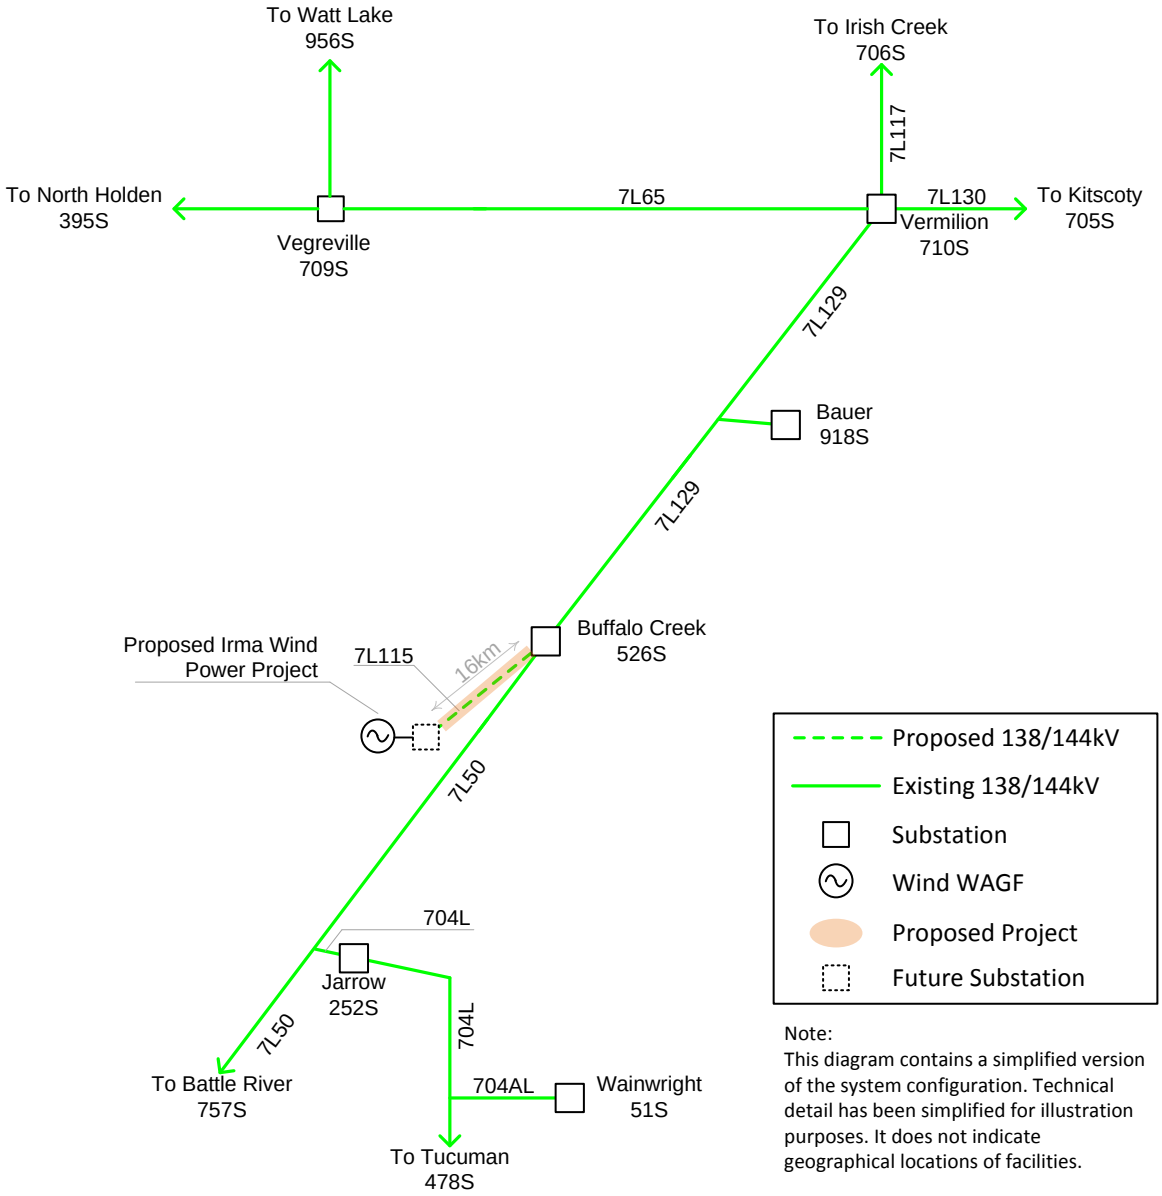
Figure 5-1: Connection Alternative 1



Alternative 2 – Radial connection to the Buffalo Creek 526S substation:

Connect the proposed Facility to the Buffalo Creek 526S substation as shown in Figure 5-2. This alternative would require the addition of a 138 kV circuit approximately 10 to 16 km long and a 138 kV circuit breaker at the Buffalo Creek 526S substation. Under this connection alternative, the market participant's requested Rate STS contract capacity of 90 MW could be supported under Category A conditions.

Figure 5-2: Connection Alternative 2



5.2.1. Connection Alternatives Selected for Further Studies

Alternative 2 is the only alternative that can meet market participant's request for a Rate STS contract capacity of 90 MW. Therefore, Alternative 2 is the only alternative selected for further study.

5.2.2. Connection Alternatives Not Selected for Further Studies

Alternative 1 was not selected for further studies because it cannot meet the market participant's requested Rate STS contract capacity of 90 MW under Category A conditions.

6. Post-Project System Assessment

This section provides the results of the post-Project studies for Alternative 2, which was described in Section 5.

6.1. Power Flow Studies

This section provides the results for the post-Project power flow studies. The analysis of these results, including mitigations for observed Reliability Criteria violations, is provided in Section 10. All power flows are based on 138 kV system voltage.

6.1.1.1. 2017 Summer Light (2017 SL post-Project)

The 2017 SL post-Project power flow results are presented below and the related power flow diagrams are provided in Attachment C.

Category A Condition

No voltage criteria violations or thermal violations were observed in this scenario under the Category A condition.

Category B Conditions

No voltage criteria violations or voltage deviations were observed in this scenario under Category B conditions.

Thermal loadings above seasonal continuous and short-term ratings were observed and are listed in Table 6-1. The red shaded cells show the loading above short-term rating.

Table 6-1: Summary of Thermal Criteria Violations under Category B Conditions for 2017 SL Post-Project

Contingency	Limiting Branch	Seasonal Continuous Rating (MVA)	Short-term Rating (MVA)	Pre- Project		Post- Project		% Loading Difference
				Power flow (MVA)	% Loading	Power flow (MVA)	% Loading	Post-Pre
9L29 (Oakland 946S - Coyote Lake 963S)	7L128 (Coyote Lake 963S - Michichi Creek 802S)	94.9	94.9	153.3	161.5	153.3	161.5	0.0
	7L159 (Ghost Pine 114S Tap point - Heatburg 948S)	94.9	94.9	118.7	125.1	117.7	124.0	-1.0

6.1.1.2. 2017 Summer Peak (2017 SP post-Project)

The 2017 SP post-Project power flow results are presented below and the related power flow diagrams are provided in Attachment D.

Category A Condition

No voltage criteria violations or thermal violations were observed in this scenario under the Category A condition.

Category B Conditions

No voltage criteria violations or voltage deviations were observed in this scenario under Category B conditions.

Thermal loading above the seasonal continuous and short-term ratings was observed for a number of contingencies and are listed in Table 6-2. The red shaded cells show the loading above the short-term rating and the green shaded cells show the loading above the seasonal continuous rating and below the short-term rating.

Table 6-2: Summary of Thermal Criteria Violations Under Category B Conditions for 2017 SP Post-Project

Contingency	Limiting Branch	Seasonal Continuous Rating (MVA)	Short-term Rating (MVA)	Pre- Project		Post- Project		% Loading Difference
				Power flow (MVA)	% (Loading)	Power Flow (MVA)	% Loading	Post-Pre

* Lack of transformer breaker will trip the lines connected to this transformer

6.2. Transient Stability Studies

Transient stability assessment was performed for the 2017 SL and 2017 SP post-Project scenarios. Bus voltages, generator's rotor angle, and active power were monitored for the contingencies listed in Table 2-13. Generator response plots for 2017 SL and 2017 SP post-Project are included in Attachments E and F, respectively.

The results did not indicate any transient stability concerns, and the system remains stable following all studied Category B contingency conditions in the Study Area.

7. Sensitivity Studies

As discussed in Section 3.4, a sensitivity study was performed under Category A conditions.

The 500 kV HVDC power orders were set based on the reduced loss assumptions in pre-Project and post-Project study scenarios, as shown in Table 7-1.

Table 7-1: HVDC Power Orders with Reduced Loss Assumptions

Scenario	WATL(MW)	EATL(MW)
2017 SL High Coal Pre-Project	475 (N → S)	400 (S → N)
2017 SP High Coal Pre-Project	250 (S → N)	750 (S → N)
2017 SL High Coal Post-Project	500 (N → S)	375 (S → N)
2017 SP High Coal Post-Project	250 (S → N)	725 (S → N)

In the 2017 SL High Coal pre-Project Scenario a thermal criteria violation of 106% was observed on the 240 kV transmission line 912L (between Red Deer 63S and Nevis 766S).

In the 2017 SP High Coal pre-Project Scenario a thermal criteria violation of 111% was observed on the 144 kV transmission line 7L50 (between Buffalo Creek 526S and Jarrow 252S Tap Point).

In the 2017 SL High Coal post-Project Scenario a thermal criteria violation of 113% was observed on the 240 kV transmission line 912L (between Red Deer 63S to Nevis 766S).

In the 2017 SL High Coal post-Project Scenario a thermal criteria violation of 123% was observed on the 144 kV transmission line 7L129 (between Buffalo Creek 526S and Vermillion 710S).

Changing the 500 kV HVDC power orders to the values in Table 7-2 would completely alleviate these observed thermal violations. No voltage criteria violations were observed for these scenarios.

Table 7-2: HVDC Power Orders for Sensitivity Scenarios

Scenario	WATL (MW)	EATL (MW)
2017 SL High Coal Pre-Project	475 (N → S)	525 (S → N)
2017 SP High Coal Pre-Project	300 (S → N)	1000 (S → N)
2017 SL High Coal Post-Project	*550 (N → S)*	*600 (S → N)*
2017 SP High Coal Post-Project	*725 (S → N)*	*1000 (S → N)*

8. Short-Circuit Analysis

8.1. Pre-Project

Table 8-1 provides the 2017 WP pre-Project short circuit levels.

Table 8-1: Summary of Short-Circuit Current Levels – 2017 WP Pre-Project

Note: 1) per unit (p.u.) quantities are on 100MVA base and system voltage base.

The short-circuit analysis concludes that the Project connection will not adversely change the short circuit levels in the nearby substations.

9. Project Dependencies

The Project does not require the completion of any AESO plans to expand or enhance the transmission system prior to connection.

10. Conclusion and Recommendation

The connection assessment observed pre-Project and post-Project system performance issues, as is shown in Table 10-1.

The power flow results showed that pre-Project thermal criteria violations on the 144 kV transmission line 7L50 were alleviated in the post-Project scenarios. As a result, the RAS #138 will not be needed after the Project is connected.

The post-Project power flow studies identified thermal criteria violations on the transmission line 7L129 under certain Category B contingencies. These violations include thermal loading above the short term rating under certain Category B contingencies and thermal loading above the seasonal continuous rating under other Category B contingencies.

Studies showed that these system performance issues were mitigated through application of a proposed new RAS and real-time operational practices, respectively.

The requirement for the proposed new RAS will be removed by the Provost to Edgerton and Nilrem to Vermilion Transmission System Reinforcement (PENV) project.[7] The target in-service date for the PENV project is Q1 2021.

The power flow diagrams and effectiveness factors are included in Attachment G, H and I.

The Project connection did not impact the transient stability performance of the AIES or the short-circuit levels of the surrounding substations.

Table 10-1 provides further analysis of and conclusions about the impact of the Project, including mitigation measures for the observed Reliability Criteria violations.

Table 10-1: Summary of Reliability Criteria Violations, Project Impact and Mitigation Measures

Reliability Criteria Violations		Scenario	Pre-Project		Post-Project	
Violation	Contingency		Thermal Violation Type	Mitigation Measures	Thermal Violation Type	Mitigation Measures

Several thermal violation*	Metiskow 648S transformer T1 (648ST1)	2017SP and SL	Above short term rating	Real time Operational practices	Above short term rating	Real time operational practice

*The Metiskow 648S substation transformer, T1 (648ST1) contingency is a known existing system issue and the violation associated with the contingency will be managed using real-time operational practices. The results for this contingency have not been included in this report. The Project has no impact on these violations.

Recommendations

It is recommended to proceed with the Project using Alternative 2 as the preferred alternative to respond to the market participant's request for system access service and a proposed new RAS for the 144 kV transmission line 7L129.

A new RAS for transmission line 7L129 is required to mitigate the observed thermal criteria violation under certain Category B conditions. It is also recommended that real-time operational practices and the planned Hand Hills RAS be used to mitigate the identified post-Project system performance issues. The existing RAS #138 will not be needed following the Project connection.

A minimum rating of 100 MVA is recommended for the new 138 kV circuit (between the proposed Facility and the existing Buffalo Creek 526S) and is consistent with good electric industry practice.

ATTACHMENT F

2017SP Transient Stability Diagrams

Table F-2: Summary of Transient Stability Diagrams for 2017SP, Alt3, Mainstream Wainwright WAGF Proceeds

Figure #	Contingency	From Substation	T-Tap	To substation	Fault Location
F-1	7L42	751S Hill		716S Lloydminster	751S Hill
F-2					716S Lloydminster
F-3	7L50	757S Battle River	252S Jarrow	526S Buffalo Creek	757S Battle River
F-4					526S Buffalo Creek
F-5	7L53	700S Bonnyville	Lindbergh Tap	706S Irish Creek	700S Bonnyville
F-6					706S Irish Creek
F-7	7L65	709S Vegreville		710S Vermilion	709S Vegreville
F-8					710S Vermilion
F-9	7L70	700S Bonnyville		707S St.Paul	700S Bonnyville
F-10					707S St.Paul
F-11	7L115	526S Buffalo Creek		926S Kinsella (Mainstream)	526S Buffalo Creek
F-12					926S Kinsella
F-13	7L117	706S Irish Creek		710S Vermilion	706S Irish Creek
F-14					710S Vermilion
F-15	7L129	526S Buffalo Creek	Bauer Tap	710S Vermilion	526S Buffalo Creek
F-16					710S Vermilion
F-17	701L/7L701	757S Battle River	764S Heisler	223S Strome	757S Battle River
F-18					223S Strome
F-19	749L	899S Edgerton	Killarney Tap	648S Metiskow	899S Edgerton
F-20					648S Metiskow
F-21	749L/7L749	899S Edgerton	Briker Tap	716S Lloydminster	899S Edgerton
F-22					716S Lloydminster
F-23	9L20	755S Cordel		766S Nevis	755S Cordel
F-24					766S Nevis
F-25	9L59	801S Anderson		972S Tinchebray	801S Anderson
F-26					972S Tinchebray
F-27	912L	766S Nevis		63S Red Deer	766S Nevis
F-28					63S Red Deer

Constraint Summary

Table H-1: Remedial Action Scheme	
RAS Number	**RAS Name**
32	Battle River 7L50 and 7L701 TPS
138	7L50-526S Buffalo Creek overload mitigation scheme
139	901T-766S Nevis overload mitigation scheme
138-R1[1]	BluEarth Hand Hills RAS - 7L50 - 526S Buffalo Creek overload mitigation scheme
138-R2[1]	Suncor Hand Hill RAS - 7L50 - 526S Buffalo Creek overload mitigation scheme
139-R1[1]	BluEarth Hand Hill RAS – Various overloads due to 9L29 outage mitigation scheme
139-R2[1]	Suncor Hand Hill RAS – Various overloads due to 9L29 outage mitigation scheme
149	7L129 - 526S Buffalo Creek overload mitigation scheme

[1] Existing RAS logic and settings to be revised to include BluEarth and Suncor Hand Hills WAGF connection projects based on ISD (In-Service Date) of each project

Table H-2: Performance Violations and Potential Mitigation Options

* Lack of transformer breaker will trip the lines connected to this transformer
‡ Managed by the AESO and TFO real time operating practise
† See page 19 in http://www.aeso.ca/downloads/Central_LRP_Report_11Apr2014_signed.pdf

Table H-3: Remedial Action Scheme Details		
Monitoring Point	**RAS Logic and Settings**	**Automatic Remedial Action**
RAS # 138: 7L50 (Jarrow Tap – Buffalo Creek 526S) Overload Mitigation (To be modified for BluEarth and Suncor Hand Hills WAGF Connection Projects)		
At Buffalo Creek 526S 7L50 Terminal Direction of flow: • From Jarrow Tap to 526S	Runback/Trip Settings: • Line Loading >= 100% of seasonal line rating in MVA for 10 sec.	• Send DTT to trip 704L breaker 252S2 at 252S • If overload continues, send continuous RAS signal to Halkirk WAGF until line loading is 95% of seasonal line rating • If overload continues after 10 minutes, sequentially trip Halkirk WAGF LV breakers after waiting 5 sec between each trip. • If overload continues sequentially trip BluEarth Hand Hills WAGF LV breakers • If overload continues sequentially trip Suncor Hand Hills WAGF LV breakers
	Trip Logic and Settings: • Line Loading >= 110% of seasonal line rating in MVA for 10 sec	• If overload continues for 5 sec, send DTT to sequentially trip Halkirk WAGF LV breakers after waiting 5 sec between each trip • If overload continues, sequentially trip BluEarth Hand Hills WAGF LV breakers • If overload continues sequentially trip Suncor Hand Hills WAGF LV breakers
	• Communication and other RAS Failure	• Send alarm to AltaLink SCC, ATCO Electric SCC and AESO SC

RAS # 139: Various Overloads due to 9L29 Outage Overload Mitigation – (9L29 LTO status) (To be modified for BluEarth and Suncor Hand Hills WAGF Connection Projects)		
9L29 LTO at 963S and 946S	Trip Logic and Settings: • (9L29 LTO = True at 963S or 946S)	• Send DTT to trip BluEarth Hand Hills and Suncor Hand Hills WAGF LV breakers.
	• Communication and other RAS Failures	• Send alarm to ATCO Electric SCC and AESO SC

RAS # 149: 7L129 (526S Buffalo Creek – 710S Vermilion) Overload Mitigation (To be created for EON Grizzly and Mainstream Wainwright WAGF Connection Projects)		
At Buffalo Creek 526S 7L129 Terminal Direction of flow: • From 526S to 710S	Runback/Trip Settings: • Line Loading >= 100% of seasonal line rating in MVA for 10 sec.	• Send continuous RAS signal to Mainstream Wainwright *(EON Grizzly in Alternative 5c)* WAGF until line loading is 95% of seasonal line rating • If Alternative 5c and overload continues after 10 minutes, sequentially trip EON Grizzly WAGF LV breakers • If overload continues after 10 minutes, sequentially trip Mainstream Wainwright WAGF LV breakers
	Trip Logic and Settings: • Line Loading >= 110% of seasonal line rating in MVA for 10 sec	• If Alternative 5c and overload continues for 5 sec, send DTT to sequentially trip EON Grizzly WAGF LV breakers • If overload continues for 5 sec, send DTT to sequentially trip Mainstream Wainwright WAGF LV breakers
	• Communication and other RAS Failure	• Send alarm to AltaLink SCC, ATCO Electric SCC and AESO SC

Table H-4: Remedial Action Scheme Details				
RAS #32: Battle River Thermal Protection Schemes (TPS) RAS (prior to WAGF Connections) that trips Battle River unit 3 or 4 when both on line				
RAS Number	**RAS Name**	**Location**	**RAS Type**	Battle River Unit 3 or 4 will receive RAS DTT if any one of the following conditions becomes true
32	Battle River 7L701 and 7L50 Thermal Protection Schemes (TPS)	757S	Thermal	Line MVA loading exceeds emergency rating of any of the two lines

ATTACHMENT I

Generator Effectiveness Factors

Table G-0: Generator Types

Plant	Irma Wainwright	Halkirk	Wintering Hills	Ghost Pine	Suncor Hand Hill	BluEarth Hand Hill	BluEarth BullCreek	Battle River	Sheerness
Type	Wind	Wind	Wind	Wind	Wind	Wind	Wind	Coal	Coal

The sign convention for the following tables is as follows:

+: An increase in generation results in an increased flow, or
A decrease in generation results in a decreased flow

-: An increase in generation results in a decreased flow, or
A decrease in generation results in an increased flow
