Dear Market Participants and Other Interested Parties:

**Re: Transmission Changes Associated with the Keephills 3 Generator Interconnection Project and the Edmonton Region 240 kV Line Upgrades Project**

In keeping with the AESO's commitment to provide information to all market participants in an open, fair and timely manner, [updated single line diagrams](#) (SLDs) for the integrated construction plan for the transmission system portion of the Keephills 3 Generator Interconnection and the Edmonton Region 240kV Line Upgrades Project have been posted to our website.

The AESO's intention is to provide an overview of the consolidated construction plan for the two projects to help market participants understand the context of the related transmission line and generator curtailments noted on the AESO website.

Stakeholders are advised that project information is subject to change and they can keep apprised of the project status by checking the [project update page](#), as well as the AESO's two outages reports: [Long Term Critical Outages](#) and [Approved Outages](#) which can be found on the AESO website under "Grid Operations > Outages."

The project webpage and the SLDs will be updated as necessary throughout the project in order to provide, to the best of our ability, updated information to stakeholders in a timely, comprehensive, and transparent manner.

These SLDs will be updated and published if significant project changes occur. Should you have any questions regarding this information please contact Ron Strem, Technical Specialist, Engineering at ph: 403-539-2472.

Sincerely,
