

# AESO Reliability Standards Monthly Report

February 2009

## **Proposed New Standard – Reliability of Protection Systems**

### **Purpose:**

Standard Authorization Request (SAR), Version 1, posted for comment.

### **Current Standard:**

The SAR proposes that a new standard be developed.

### **Proposed Standard:**

The proposed standard would require facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. This will likely be a PRC standard.

### **Applicability:**

Transmission Owners, Generation Owners and Distribution Providers

### **Current Status:**

The Draft SAR was posted for comment until February 18. After much discussion between the ISO Standards Review Committee (SRC) members, consensus could not be reached and no group comments were submitted. The AESO will monitor the progress of the SAR.
