Agenda

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Session purpose and objectives

The purpose of this session is to build shared understanding of common themes between the stakeholder proposals and the AESO's rate design bookends, and areas of agreement and disagreement. The session objectives include:

- Understand common themes across stakeholder rate design proposals and the AESO rate design bookends
- Understand areas of agreement and disagreement and why
- Introduce mitigation conversation to foster/build understanding

Date: **Thursday, Dec. 10, 2020**
Time: **9:00 a.m. – 12:30 p.m.**
Location: **Webinar**
Facilitator: **Stack'd**

Time	Agenda Item	Presenter
9:00 – 9:15	Welcome, introduction, purpose and session objectives	AESO
9:15 – 9:45	Overview of proposals and session feedback • Opening remarks • Spectrum of options • Discussion and Q&A	AESO
9:45 – 10:30	Review themes • Cost allocation • Energy storage tariff treatment • Discussion and Q&A	AESO
10:30 – 11:00	Break	
11:00 – 11:30	Review themes • Status quo • Complexity • Discussion and Q&A	AESO
11:30 – 12:00	Review minimal disruption and mitigation process • Mitigation to achieve minimal disruption • Mitigation process • Discussion and Q&A	AESO
12:00 – 12:15	Review areas of agreement and disagreement • Discussion and Q&A	AESO
12:15 – 12:30	Session close-out and next steps	AESO

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

December 10, 2020

Public

Notice

In accordance with its mandate to operate in the public interest, the AESO will be audio recording this session and making the session recording available to the general public at www.aeso.ca. The accessibility of these discussions is important to ensure the openness and transparency of this AESO process, and to facilitate the participation of stakeholders. Participation in this session is completely voluntary and subject to the terms of this notice.

The collection of personal information by the AESO for this session will be used for the purpose of capturing stakeholder input for the Bulk and Regional Tariff Design engagement sessions. This information is collected in accordance with Section 33(c) of the *Freedom of Information and Protection of Privacy Act*. If you have any questions or concerns regarding how your information will be handled, please contact the Director, Information and Governance Services at 2500, 330 – 5th Avenue S.W., Calgary, Alberta, T2P 0L4, by telephone at 403-539-2528, or by email at privacy@aeso.ca.

COVID-19 update

- The AESO's top priorities are the health and well-being of our employees and stakeholders and continuing to meet the electricity needs of all Albertans
- All business meetings with external stakeholders will be via phone or webinar indefinitely (this includes stakeholder engagement sessions)
- Based on stakeholder feedback, the AESO's own security assessment and the use of Zoom for governments, post-secondary institutions and other companies, the AESO has decided for now to continue using Zoom for our stakeholder engagements until such time that face-to-face engagements are allowed
- The AESO will continue to monitor developments and provide updates to our stakeholders as necessary
- For additional information, please visit the AESO website at www.aeso.ca and follow the path Stakeholder Engagement > COVID-19

How to Ask Questions

Public

Using Zoom – asking questions

- All attendees join the webinar in listen-only mode and the host will have attendee cameras disabled and microphones muted
- When asking or typing in a question, please state
  - **The organization you work for and your first and last name**
- Two ways to ask questions if you are accessing the webinar using your computer or smartphone
  - If you would like to ask a question during the Q&A portion, click the icon to raise your hand and the host will see that you have raised your hand. The host will unmute your microphone, you in turn will need to unmute your microphone and then you can ask your question. Your name will appear on the screen but your camera will remain turned off.
  - You can also ask questions by typing them into the Q&A window. Click the “Q&A” button next to “Raise Hand.” You’re able to up-vote questions that have been already asked.

Using Zoom – where to access controls

- Using a 2-in-1/PC/MAC Computer
  - Hover your cursor over the bottom area of the Zoom app and the Controls will appear.
  - Click “Raise Hand” and the host will be notified that you would like to ask a question.
  - Click “Lower Hand” to lower it if needed.
  - You can also ask questions by tapping the “Q&A” button and typing them in. You’re able to up-vote questions that have been already asked.
- Using a Smartphone
  - Tap “Raise Hand.” The host will be notified that you've raised your hand.
  - Tap “Lower Hand” to lower it if needed.
  - You can also ask questions by tapping the “Q&A” button and typing them in. You’re able to up-vote questions that have been already asked.

Using Zoom – where to access controls

- If you are accessing the webinar via conference call
  - If you would like to ask a question during the Q&A portion, on your phone's dial pad, hit *9 and the host will see that you have raised your hand. The host will unmute your microphone, you in turn will need to unmute your microphone by hitting *6 and then you can ask your question. Your number will appear on the screen.
- Phone controls for attendees
  - To raise your hand, on your phone's dial pad, hit *9. The host will be notified that you've raised your hand.
  - To toggle between mute and unmute, on your phone's dial pad, hit *6.

Stakeholder participation

The participation of everyone here is critical to the engagement process. To ensure everyone has the opportunity to participate, we ask you to:

- Listen to understand others' perspectives
- Disagree respectfully
- Balance airtime fairly
- Keep an open mind

Welcome and Introductions

Public

Session purpose and objectives

- Session purpose
  - To build shared understanding of themes between the stakeholder rate design proposals and areas of agreement and disagreement
- Session objectives
  - Understand common themes across stakeholder rate design proposals and the AESO rate design bookends
  - Understand areas of agreement and disagreement and why
  - Introduce mitigation conversation to foster/build understanding

Agenda

Time	Agenda Item	Presenter
9:00 – 9:15	Welcome, introduction, purpose and session objectives	AESO
9:15 – 9:45	Overview of proposals and session feedback • Opening remarks • Spectrum of options • Discussion and Q&A	AESO
9:45 – 10:30	Review themes • Cost allocation • Energy storage tariff treatment • Discussion and Q&A	AESO
10:30 – 11:00	Break	
11:00 – 11:30	Review themes • Status quo • Complexity • Discussion and Q&A	AESO
11:30 – 12:00	Review minimal disruption and mitigation process • Mitigation to achieve minimal disruption • Mitigation process • Discussion and Q&A	AESO
12:00 – 12:15	Review areas of agreement and disagreement • Discussion and Q&A	AESO
12:15 – 12:30	Session close-out and next steps	AESO

Registration (as of Dec. 3, 2020)

- Acestes Power
- Alberta Direct Connect Consumers Association (ADC)
- Alberta Forest Products
- Alberta Newsprint Company (ANC)
- Alberta Utilities Commission (AUC)
- AltaLink Management Ltd.
- Arcus Power
- ATCO Electric Ltd.
- Battle River Power Coop
- BECL and Associates Ltd.
- Best Consulting Solutions Inc.
- BluEarth Renewables
- Canadian Renewable Energy Association (CanREA)

Overview of Engagement Process

Public

AESO Stakeholder Engagement Framework

Overall approach for bulk and regional tariff design stakeholder engagement

The AESO intends to:

i. Engage with stakeholders to allow stakeholders' needs and interests to be consistently, transparently and meaningfully considered in the development of a rate design proposal for bulk and regional cost recovery;

ii. Engage with stakeholders regarding the objectives to be examined and evaluated in the development of a rate design proposal for bulk and regional cost recovery;

iii. Supply stakeholders with analysis tools for bulk and regional cost recovery impact analysis;

iv. Seek and identify for the Alberta Utilities Commission (AUC) areas of agreement and disagreement in the AESO rate design proposal to accelerate the regulatory approval process; and

v. File with the AUC an application for bulk and regional rate design by June 2021.

Revised engagement and filing schedule

Session 1 March 13, 2020	Session 2 Sept 24, 2020	Session 3 Nov. 5, 2020	Session 4 Dec. 10, 2020	Session 5 Feb. 25, 2021	Session 6 April 15, 2021
Session objectives	**Session objectives**	**Session objectives**	**Session objectives**	**Session objectives**	**Session objectives**
• Present rate design options for bulk and regional cost recovery with rate objectives assessment • Provide rate design analysis tools • Review, respond to clarifying questions and collect initial input on options	• Review and gain acceptance on process and approach to complete a rate design • Understand current state rate design • Reconfirm tariff rate design objectives and balance of trade-offs • Understand rate design bookends • Identify initial implications of rate design bookends • Understand energy storage treatment options and considerations • Provide technical clarity around rate design bookends	• Stakeholders to present and discuss alternative rate design options, including energy storage options and implications • Understand which rate design options stakeholders support and why	• Understand common themes across stakeholder rate design proposals and the AESO rate design bookends • Understand areas of agreement and disagreement and why • Introduce mitigation conversation to foster/build understanding	• Present preferred rate design, including energy storage treatment, to stakeholders • Discuss and evaluate mitigation options • Present bill impact summary and assumptions • Provide Bill Impact Tool • Begin to discuss implementation considerations	• Present preferred mitigation path to stakeholders • Present and collect feedback on the emerging application (to be filed by June 2021) • Share and discuss the implications of the rate design proposal and mitigations • Understand outstanding stakeholder concerns

Reminder of engagement scope

- In-scope
  - Rate design for bulk and regional charges (calculation)
  - Tariff treatment of storage
  - Reduction of associated regulatory requirements (red tape reduction), where applicable
- Out-of-scope
  - Participant-Related Costs for DFOs (Substation Fraction) and DFO Cost Flow-Through
  - 2020 Rates Update
  - Other 2018 GTA Decision and Corresponding Compliance Filing Items

Opening Remarks

Public

Your participation

- Your participation to date has been very helpful to the AESO in understanding your perspectives and helping the AESO begin to develop its bulk and regional rate design proposal
- We appreciate the time it takes to develop proposals, prepare for and attend the sessions, as well as provide written feedback sharing your thoughts and insights following the sessions
- Your continued participation in this engagement is critical to help us make a well-informed decision for the benefit of Albertans

Bulk and Regional Tariff Design progress

- AESO maintains that it is important to progress changes to the bulk and regional rates now
  - Technology and cost trends are influencing consumers decisions in how to meet their electricity needs; these trends are influencing the need for changes to transmission cost allocation
  - Need to take a long term view on how to make transmission cost recovery sustainable
- Will continue to progress in parallel with other engagements and initiatives
  - AESO is involved in a recently initiated Government of Alberta engagement on Self-Supply and Export Policy
  - Cost allocation decisions guiding bulk and regional rate design are important regardless of a policy decision on self-supply and export

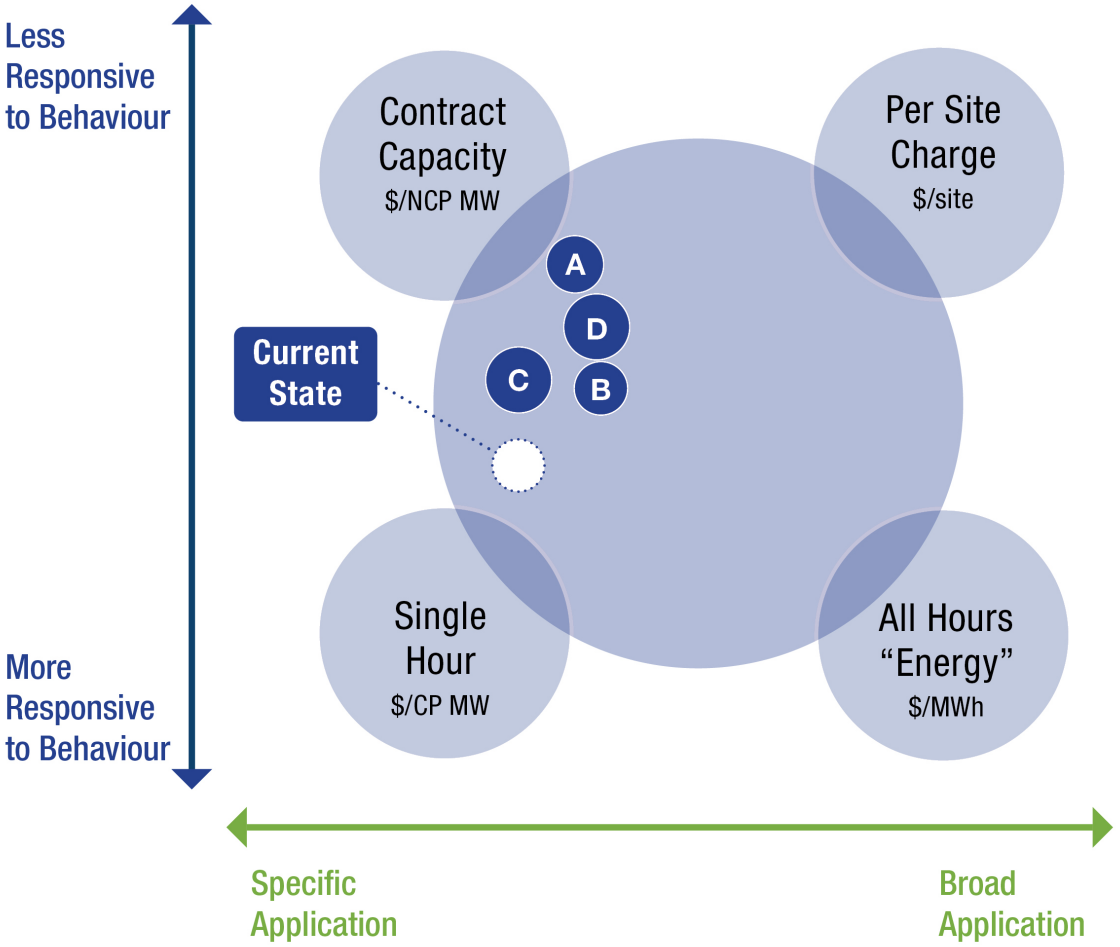
Spectrum of options

Public

Proposals presented on Nov. 5, 2020

- Bulk and regional rate design proposals
  - Joint presentation by Alberta Direct Connect Consumers Association (ADC), Dual Use Customers (DUC) and Industrial Power Consumers Association of Alberta (IPCAA)
  - Suncor Energy Inc
  - Consumers Coalition of Alberta (CCA)
  - Joint presentation by Canada West Ski Areas Association (CWSAA), Utilities Consumer Advocate (UCA), AltaLink Management Limited (AML) and Conoco
- Energy storage treatment proposals
  - Energy Storage Canada (ESC) supported by Power Advisory LLC (PA)
  - Canadian Renewable Energy Association (CanREA) supported by Solas Energy Consulting (SEC)
  - RMP Energy Storage

Spectrum of options presented to date



A: *AESO bookend A*
B: *AESO bookend B*
C: *CWSAA, UCA, AML, Conoco*
D: *CCA*

*Suncor proposal not shown as it includes blend of CP, NCP and per site charges
*ADC, IPCAA and DUC joint presentation recommends "current state" (status quo)

Rate design proposals (updated)

Charge	Status Quo	Bookend A – AESO	Bookend B – AESO	Alternative C – AML+	Alternative D – CCA	Suncor
Demand ($/MW NCP)	Regional: 90%	100%	Intra-regional: 100%	Regional: 90% Bulk: 93% (un-ratcheted NCP)	Monthly NCP: X% Ratcheted NCP: (1-X)%	Marginal Bulk (un-ratcheted) Z%
Peak (System/ Regional) ($/MW CP)	Bulk: 93%	N/A	Inter-regional: 100%	N/A	N/A	Regional coincident inflows: X% Regional coincident demand: Y%
Energy ($/MWh)	Bulk: 7% Regional: 10%	N/A	N/A	Bulk: 7% Regional: 10%	N/A	N/A
Customer ($/site)	N/A	N/A	N/A	N/A	N/A	(1-X-Y-Z)%

CP: Coincident Peak; **NCP:** Non-coincident peak (i.e., billing capacity)

AML+ is CWSAA, UCA, AML and Conoco joint proposal

Ratchets: demand charge can be set monthly, or ratcheted for a period of time

- Monthly (un-ratcheted) demand sets charge based on maximum demand in a given month
- Ratchets set demand charges based on maximum monthly demand for next two years (status quo)

What we heard

- Some stakeholders suggest that burden of proof is on the AESO to make the case for changes to status quo
  - Now is not the time for change
  - No issues with current rate design
- Other stakeholders identified the following changes relative to status quo
  - Allocate bulk costs to billing capacity (NCP) charge, reduce/remove ratchets (two proposals)
  - Extend from system to regional CP, with additional precision and complexity (one proposal)
  - Calculate marginal cost of transmission savings to set rates for load to respond (two proposals)

Questions?

Public

Themes

Public

Themes

- Themes that emerged across stakeholder proposals
  - Themes we are exploring
    - Cost allocation: embedded and marginal approaches
    - Energy storage tariff treatment
  - Themes we are not exploring
    - Continuing status quo
    - Additional complexity
  - Mitigation to achieve minimal disruption

Cost allocation

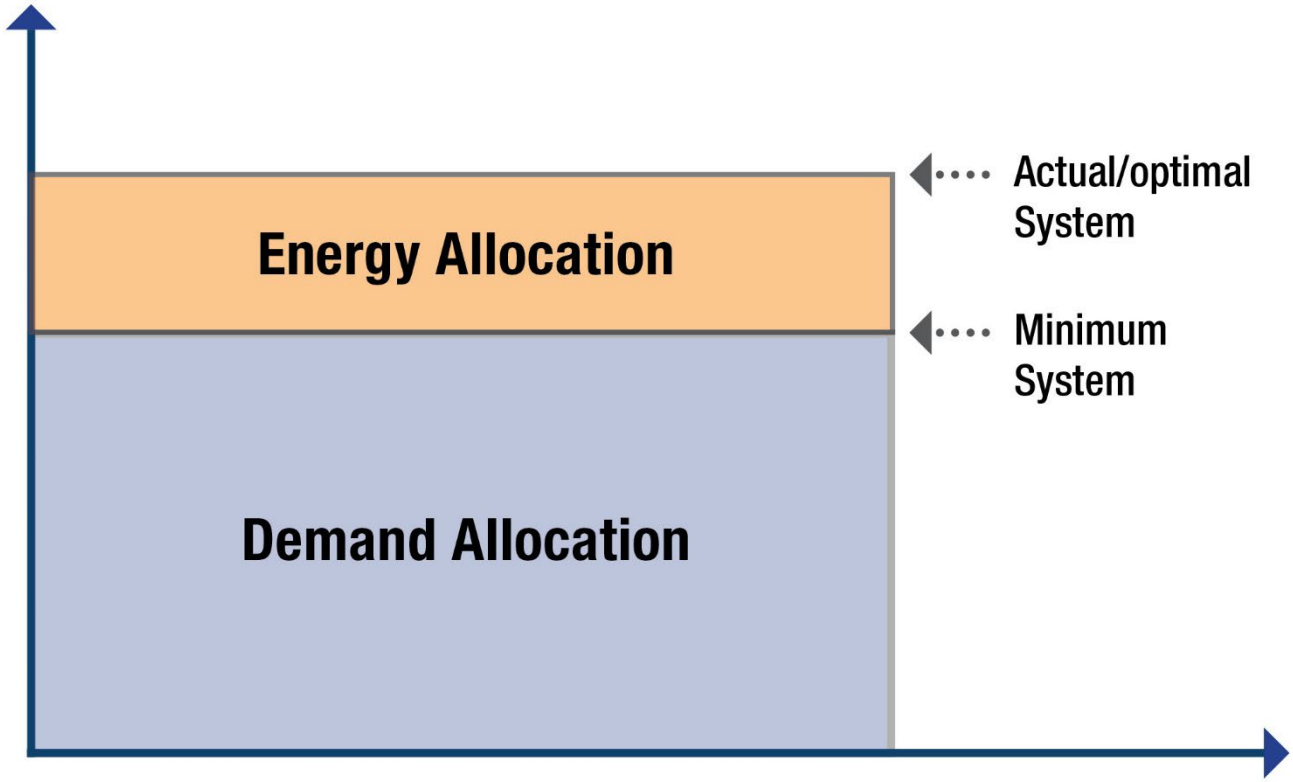
Public

Embedded or marginal cost allocation

- **Embedded approach**
  - Answers: “how is planned, current, or future use of the network related to costs of the network?”
  - Status quo classification between demand and energy charges is based on embedded approach to cost allocation
    - Developed through London Economics 2014 study for tariff application
    - Updated inputs in 2018, relied on same approach as 2014
    - Stakeholders have asked for an update to the study
- **Marginal / Incremental approach**
  - Answers: “what is the incremental cost of supplying one more unit of demand? Or what is the cost savings from reducing demand by one unit?”
  - A shift from historical rate design approach
  - Incorporated in two stakeholder proposals

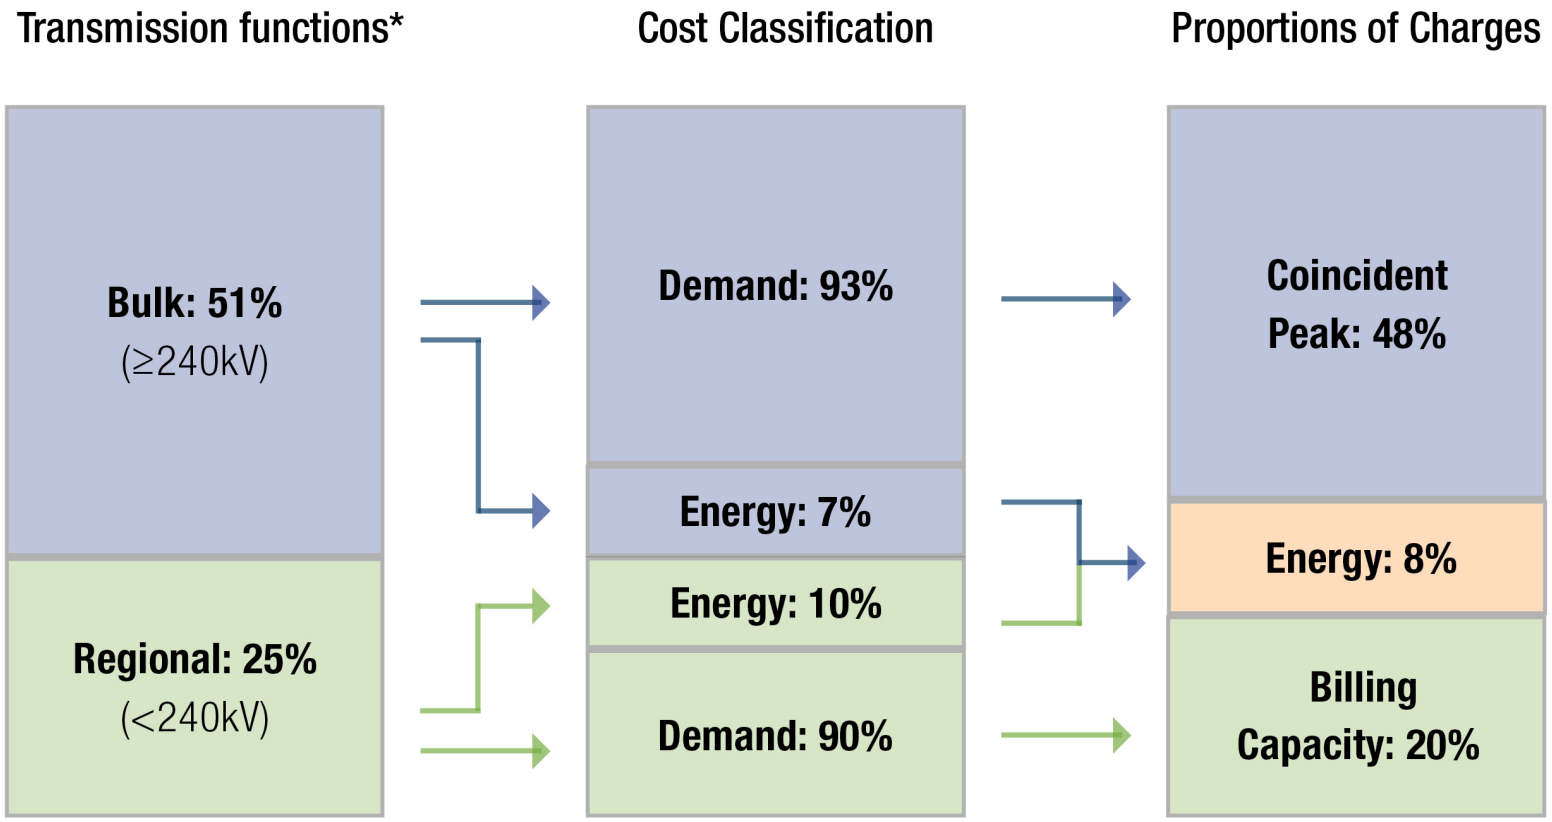
Status quo: How embedded costs are allocated

- Estimates the difference between the “minimum system” needed to serve load and the actual or optimal system
  - Since 2014 allocations have not adjusted to reflect investment or changes in forecasts of future use



Charges based on current cost allocation (updated)

- Portion of costs recovered on each charge is based on voltage and allocation of that portion to cost drivers (demand and energy) using the minimum system approach



*POD Costs (25%) not shown

Alternatives within embedded approach

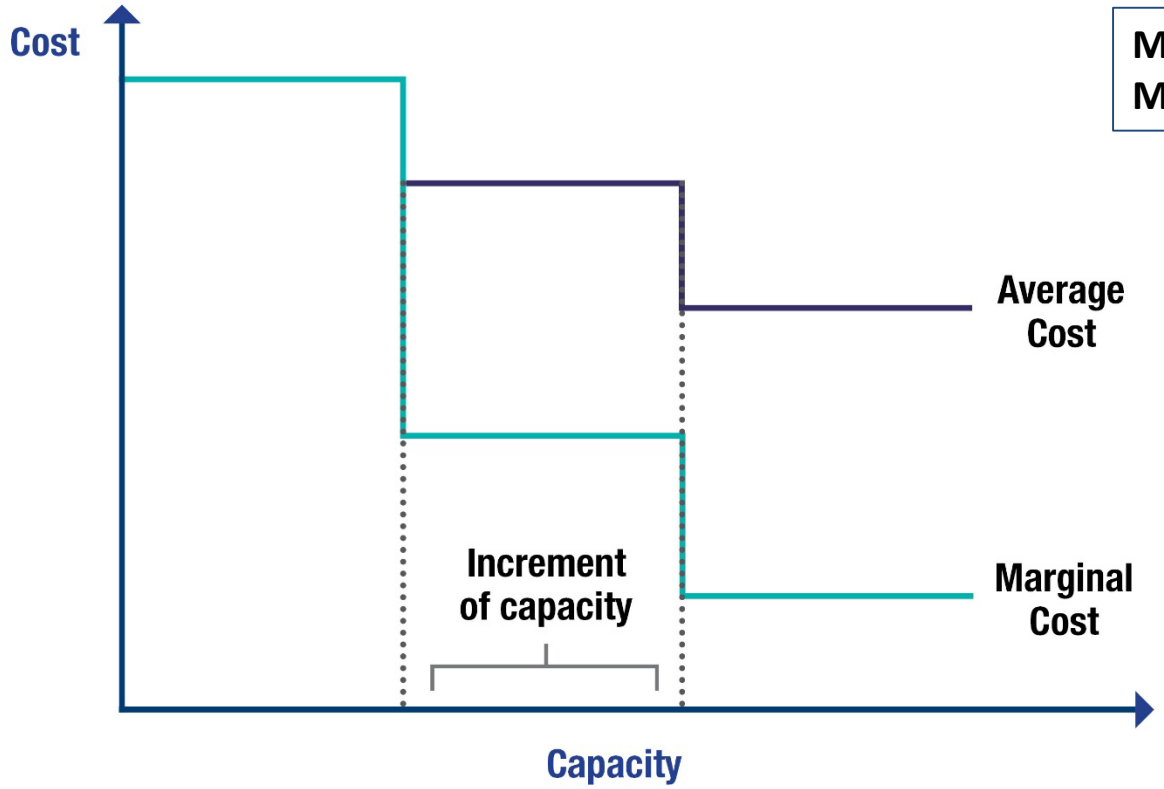
- Functional alternatives
  - Voltage (current approach)
  - Intra and Inter regional (e.g., Bookend B)
  - Load or policy drivers (London Economics “special” category in 2014)
- Classification alternatives
  - Minimum system (current approach)
    - Smallest system needed: demand
    - Difference between minimum and optimum: energy
  - Minimum Intercept
    - Zero-intercept of cost curve represents customer component
  - Marginal Cost Approach
  - Average and Excess Approach
    - Average system load factor: energy allocation
    - Remainder (excess): system load above average -> demand

Marginal approach: Rationale (RAP)

- The fundamental principle of marginal cost pricing is that economic efficiency is served when prices reflect current or future costs — that is, the true value today of the resources that are being used to serve demand rather than historical embedded costs.
  - Advocates for a marginal cost of service study approach work backwards from this pricing concept to suggest that cost allocation should be based around marginal costs as well
  - Critics of marginal cost methods often point out that this economic theory is appropriate only when other conditions are present, including that all other goods are priced based on marginal costs, that there are no barriers to entry or exit from the market and that capital is fungible

Marginal approach

- Starting from effective price signal, work backwards to cost recovery
- Marginal Cost: Change in cost to serve one more customer/MW with next increment of capacity
- Difference between marginal and average costs recovered to minimize distortions



Micro: incrementally larger lines
Macro: incremental load growth

Options for marginal calculation (updated)

- Stakeholders have identified the following approaches
  - Long run incremental transmission cost divided by long run planned load growth
    - Long run ~6 years
  - Least distortionary cost recovery on customer charge (per site)
- Other approaches to consider
  - Macro approach
    - Future planned costs and planned load growth
    - Actual costs and actual growth
    - Portion of transmission projects where load is the driver
  - Micro approach
    - Analysis based on cost of “next size up” of transmission facilities (line, substation, transformer) and additional capacity it can serve

Questions?

Public

Energy Storage Tariff Treatment

Public

March 13, 2020: Options* considered for storage

I. Charge based on flows
   - DTS for inflows and STS for outflows (current tariff)

II. No DTS costs while providing certain “Market Services” (FERC Order 841 treatment)
   - Not be charged DTS when dispatched by the AESO to provide certain market services
   - Full DTS charges when not providing those services

III. Interruptible service with lower rate, since storage can be off if transmission system is stressed
   - Direct physical control by AESO, asset can be tripped off without notice (AESO has certainty)
   - Dispatch control based on bids and offers: Financial incentive to comply (not full certainty)

* Options apply to market assets and not storage as a transmission asset

Energy storage tariff proposals

- CanREA with Solas Energy Consulting
  - Treat storage as transmission facility (substation)
  - Complete tariff exemption; however, an energy storage administration fee be developed to recover storage resource's contribution to the transmission component of AESO's "own costs" related to storage treatment
  - The ISO trading charge would also apply to recover energy market administration
- Energy Storage Canada with Power Advisory LLC
  - Storage be exempt from tariff charges and pay an administration fee
  - Storage be permitted to offer services that direct storage to stop consuming during an inflow constraint and provide transmission must-run (TMR) like services that require discharge during an outflow constraint thereby deferring the need for new transmission investment
- RMP Energy Storage
  - Storage pay only STS for its discharge and pay no wires cost for charging except for station service needs
  - Likes the AESO's interruptible service option; storage would be subject to AESO System Controller directive for relieving transmission constraint
  - But unlike the AESOs interruptible service option, rate is not restricted to areas where constraint are likely to occur.

Areas of agreement

- Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
- Energy storage can participate in Alberta's electricity use-cases by providing
  - Energy Price arbitrage
  - Operating Reserves
  - Non-wires solutions for transmission deferral
- Energy Storage should be treated in a FEOC manner

Areas of disagreement

- Is energy storage a user of the grid or a component of the grid or both?
- Does energy storage use the network for the Alberta specific use-cases?
- Should energy storage pay for inflows and outflows like every other network user or not?
- Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?

Questions?

Public

Break

Public

Continuing Status Quo

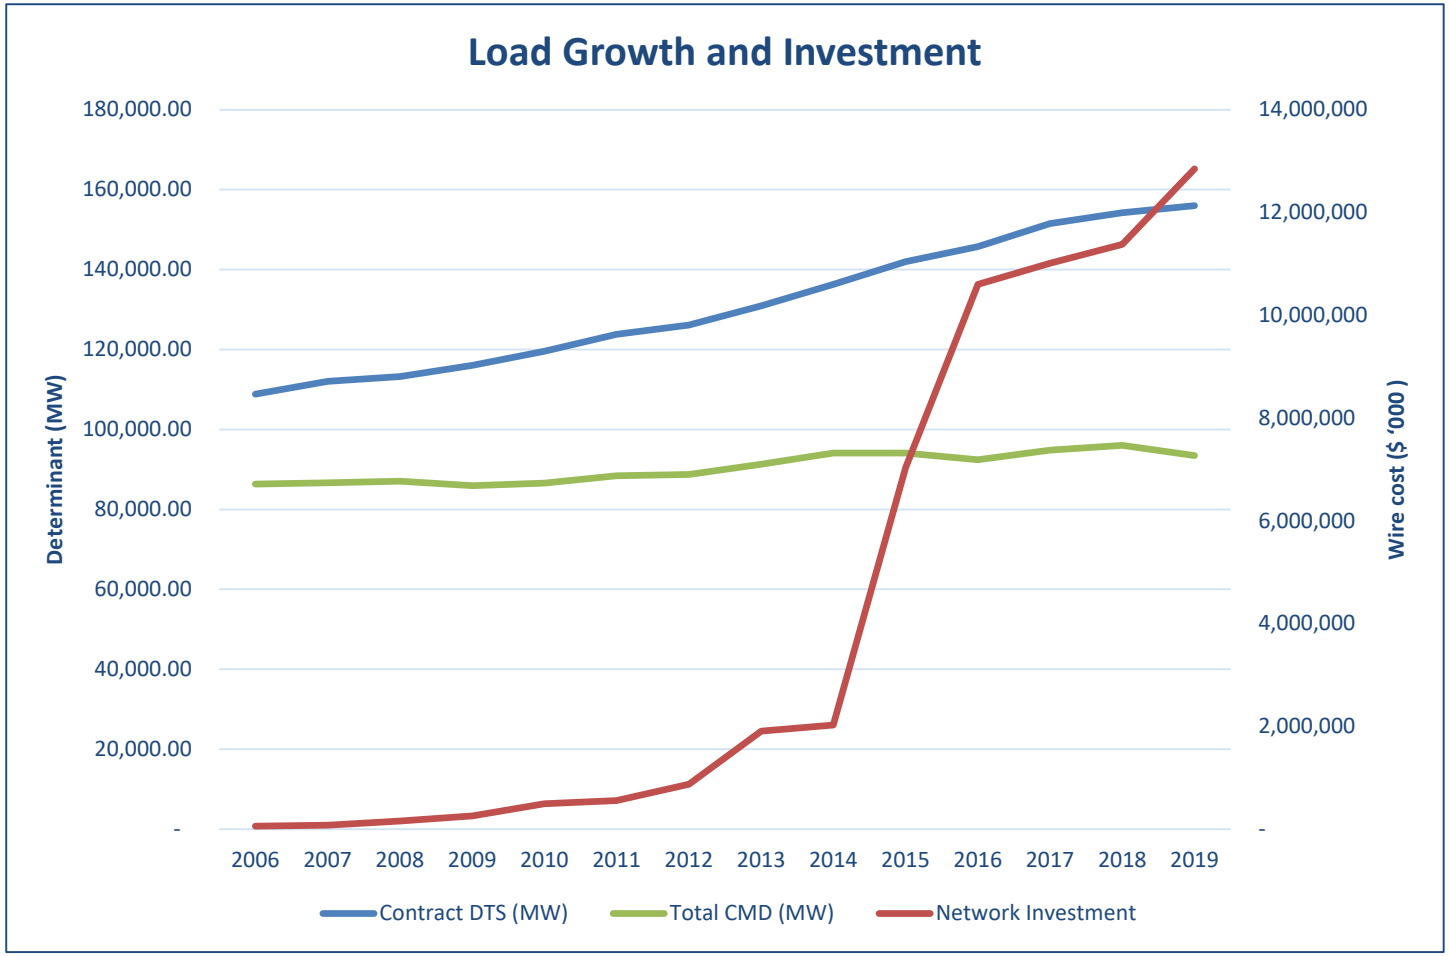
Public

Review of transmission cost drivers

- TTWG learnings report (Sept. 10, 2019) identified the following drivers of transmission development
  - Bulk power transfers
    - Foothills Area Transmission Development (FATD)
  - Local load supply
    - South and west of Edmonton project
  - Generation integration capability and access
    - Most components of Southern Alberta Transmission Reinforcement (SATR)
  - Both regional load and generation combined
    - Hanna Regional Transmission Development (HRTD) Phase 1
  - Others
    - Intertie restoration

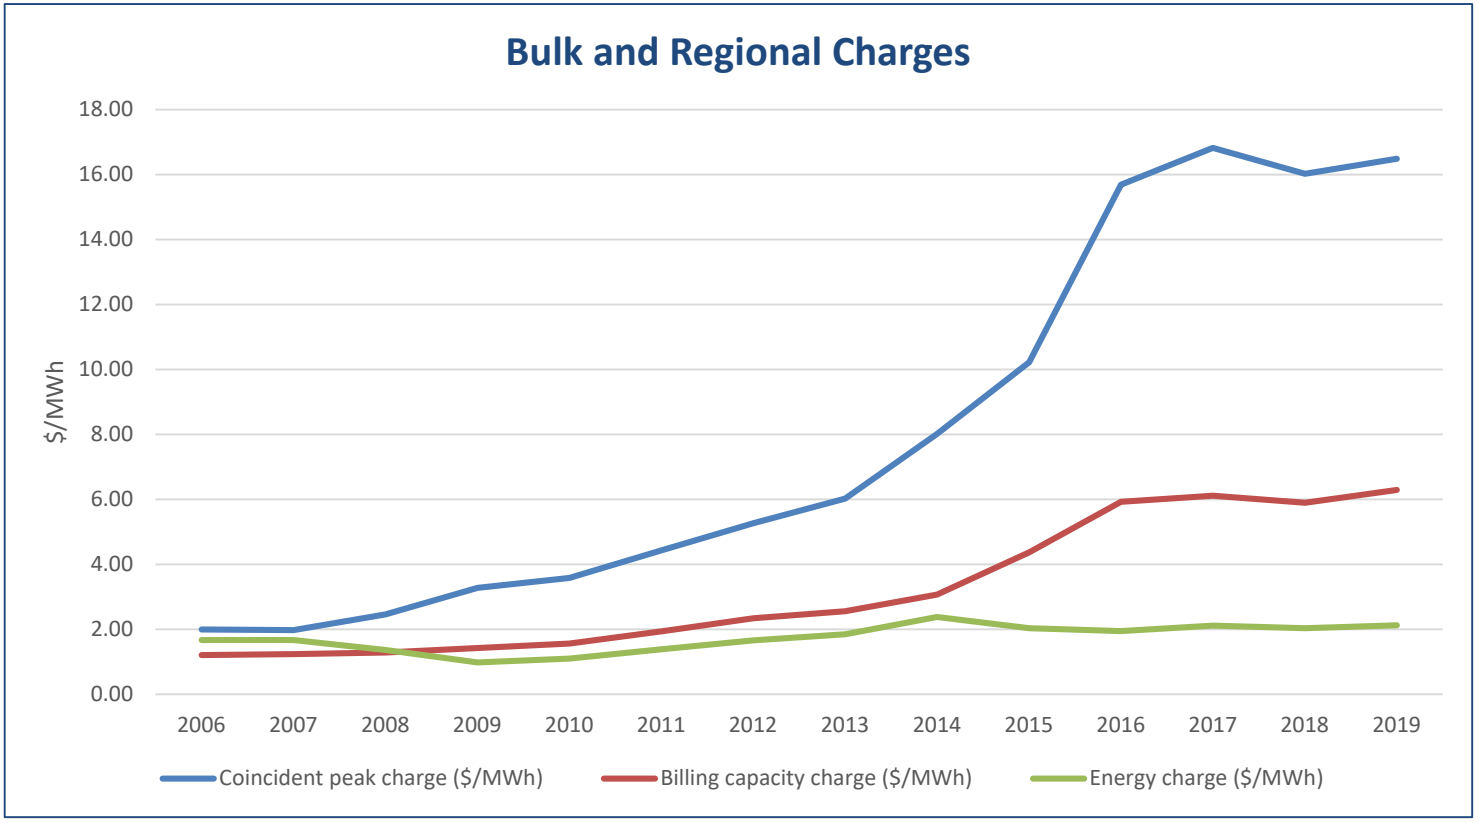
Load growth and transmission costs (updated)

- Load growth since 2006 has increased billing capacity, but coincident metered demand (CMD) has hardly changed
- Over that same time period total transmission costs have climbed



Costs recovered on coincident peak

- Bulk and regional charges (coincident peak, billing capacity, and energy charges) have evolved on different paths since 2006
  - Shown on common units ($/MWh) for relative comparison



Case for change

- Recent transmission projects are not only peak demand related
  - Transmission costs 240kV and above are recovered on CP charges, regardless of whether they are peak demand related
  - Transmission costs have grown over past decade because of multiple different drivers, not only peak demand
- Billing determinants beginning to fall
  - Customers have more options to reduce coincident peak charges today because the costs of alternatives have fallen
  - Allocation of costs to coincident peak charge encourages customers to reduce their demand at peak times that is not in proportion to the future transmission cost savings
- Current cost recovery is not sustainable
  - Price signals are counterproductive: increasing as customers use less
  - Total costs are not changing, so some customers responding shifts costs to others, further increasing incentives to respond

Questions?

Public

Additional Complexity

Public

Complexity of regional vs system peak

- High correlation between peak demand in region and system
  - Only NW is significantly different than other regions
- Regional constraints are a product of supply and demand; implementation based on demand alone will not reduce transmission constraints
  - For example in NW:
    - When generation in NW is not dispatched, peak load behavior likely contributes to transmission constraint
    - When generation is dispatched, peak load behavior less likely to contribute to transmission constraint
- Increasing number of regions increases implementation complexity
    - For example billing data disputes that require time and energy for the customer and the AESO to resolve
- Constraint of postage stamp pricing limits flexibility

Questions?

Public

Mitigation to achieve minimal disruption

Public

What we mean by minimal disruption

- Minimal disruption means finding a transition for tariff changes that balances two risks
  - Continuation of current tariff incentives risks increasing the cost shifting between customers who can respond to incentives and those who cannot
  - If the tariff changes are so significant they lead some customers to leave the grid, that risks further increasing costs to remaining customers
- Path to change should allow customers to adapt to new tariff
  - For example, phasing-in changes over time to allow customers to gradually adjust their response and manage costs

Mitigation options

Type	Category	Description	Examples
Rate Design	Transition Rate Design	Phase in tariff changes	Bulk cost recovery from 90% on 12-CP to 10% over X years
		Adjustment period	- Contract Change grace period - Reset ratchets
	Rate Classes	Set rates by customer size/type/class	- Volume discount - Interruptible/standby rate - Load attraction/retention rate
Bill Adjustment	Transition bill impacts	Bill increase of no more than X% per year for Y years	- Bill credits - Calculated based on current or future billing
	Permanent bill reduction	Bill increase of no more than X%	- Bill credits - Calculated based on current or future billing

Included in stakeholder proposals presented in Session 3 hosted on Nov. 5, 2020

- CCA: declining block prices, transitionary bill credits
- AML: permanent bill credits, load attraction and retention rates
- UCA, CWSAA, Conoco: transitionary bill credits
- ADC, IPCAA, DUC: n/a

Likely path to minimal disruption

- Depending on rate design a combination of options are likely to best achieve objectives
  - Prefer rate design mitigations over bill adjustments
  - Mitigation may not be symmetric for all customers
- For example:
  - Rate design transitions to goal state over five years
    - Remaining concern: customer goes out of business in five years instead of in one year
  - Assess rate impacts
  - Consider and model addition of rate classes
    - Evaluate additional rate mitigation
- Mitigation path depends on rate design choices

Engagement plan

Session order	Session objectives
Session 4	• Understand common themes and areas of agreement/disagreement • Introduce mitigation conversation to foster/build understanding • Present mitigation schedule and rationale to stakeholders
Stakeholder Comment Matrix Session 4	• Seek written feedback on mitigation option preference and mitigation process • Seek written feedback on cost allocation approaches and areas of agreement/disagreement
Session 5	• Present preferred rate design, including energy storage treatment, to stakeholders • Discuss and evaluate mitigation options • Present bill impact summary and assumptions • Provide Bill Impact Tool • Begin to discuss implementation considerations
Additional Technical Session (new)	• Provide information to stakeholders about how to use the Bill Impact Tool and respond to stakeholder questions
Potential One-on-One Meetings (new)	• Provide the opportunity to respond to stakeholder questions about how to use the Bill Impact Tool in a one-on-one setting
Stakeholder Comment Matrix Session 5	• Seek written feedback on the mitigation options presented at Session 5 • Seek written feedback on the preferred rate design
Session 6	• Present preferred mitigation path to stakeholders • Present and collect feedback on the application (to be filed by June 2021) • Share and discuss the implications of the rate design proposal and mitigation paths • Understand outstanding stakeholder concerns
Stakeholder Comment Matrix Session 6	• Seek written stakeholder agreement/disagreement with preferred mitigation path • Seek written feedback on the application and outstanding stakeholder concerns

Engagement plan – Mitigation

- The AESO will inform all stakeholders of the mitigation option(s) and seek feedback on those options from all stakeholders
- The Bill Impact Tool will assist all impacted stakeholders in assessing the mitigation option(s) and providing meaningful feedback to the AESO
- The AESO will limit one-on-one discussions to helping stakeholders use the Bill Impact Tool
- The AESO will seek feedback on whether stakeholders agree or disagree with the AESO's preferred mitigation path, and will provide this information to the Commission for the purpose of improving regulatory efficiency

Questions?

Public

Areas of Agreement and Disagreement

Public

Where we agree

- Efficient Price Signals
  - Price signals matter
    - Tariff charges provide incentives for customer behavior
- Cost Responsibility
  - Recognize that more than just load behavior drives transmission development
  - We are dealing with an evolving system
    - Current and future use may differ from what was originally planned
- Minimal Disruption
  - Transmission costs have risen
    - Tariff charges are more important now than ever before
  - Minimize disruption, mitigate rate shock
    - It is not in anyone's interest to reduce the number of ratepayers

Where we disagree

- Efficient Price Signals
  - Are status quo price signals efficient?
    - Price signals in tariff have reduced the cost of energy to other load
  - Are price signals forward looking?
    - Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
- Cost Responsibility
  - Is the primary objective cost causation, or cost responsibility?
  - Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
- Minimal Disruption
  - Now is not the time for change or time to stop the bleeding?
    - Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
  - Does rate mitigation need to be permanent or will customers adapt if temporary?

Next Steps and Session 5 Overview

Public

Session feedback (updated)

- We want to thank you for attending the Bulk and Regional Tariff Design Stakeholder Engagement Session 4 and we would appreciate your feedback on the session
- To limit stakeholder fatigue, we are modifying how we collect your initial feedback on the session by conducting a Zoom poll during the session rather than emailing you a short session survey following the session. The questions remain the same
- We value stakeholder feedback and we invite all interested stakeholders to provide their input on this session via the questions set out in the **Stakeholder Comment Matrix Tariff Session 4 on or before Jan. 12, 2020**. The matrix is available on our website at www.aeso.ca
  - Path: Stakeholder Engagement > Rules, Standards and Tariff Consultations > Tariff (filter) > Bulk and Regional Tariff Design > Dec. 10, 2020 Session 4

Next session

- The next session (Session 5) will be hosted on **Feb. 25, 2021**. Registration details will be available in January.
- Session 5 purpose
  - To present and discuss the preferred rate design, including energy storage treatment, and mitigation options to continue to build shared understanding and seek feedback from stakeholders
- Session 5 objectives
  - Present the preferred rate design, including energy storage treatment
  - Discuss and evaluate mitigation options
  - Present bill impact summary and assumptions
  - Provide Bill Impact Tool
  - Begin to discuss implementation considerations

Date:	[yyyy/mm/dd]			**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers	

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?	

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner	

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	
11	Do you have additional clarifying questions that need to be answered to support your understanding?	
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Bulk and Regional Tariff Design Stakeholder Engagement Session 4 hosted on Dec. 10, 2020

I. Purpose and objectives of the session

The purpose of this session is to build shared understanding of common themes between the stakeholder proposals and the AESO's rate design bookends, and areas of agreement and disagreement. The session objectives include:

- Understand common themes across stakeholder rate design proposals and the AESO rate design bookends
- Understand areas of agreement and disagreement and why
- Introduce mitigation conversation to foster/build understanding

II. Session agenda

Time	Agenda Item	Presenter
9:00 – 9:15	Welcome, introduction, purpose and session objectives	AESO
9:15 – 9:45	Overview of engagement schedule and session feedback • Opening Remarks • Spectrum of options • Discussion and Q&A	AESO
9:45 – 10:30	Review themes • Cost allocation • Energy storage treatment • Discussion and Q&A	AESO
10:30 – 11:00	Break	
11:00 – 11:30	Review themes • Status quo • Complexity • Discussion and Q&A	AESO
11:30 – 12:00	Review minimal disruption and mitigation process • Mitigation to achieve minimal disruption • Mitigation process • Discussion and Q&A	AESO
12:00 – 12:15	Review areas of agreement and disagreement • Discussion and Q&A	AESO
12:15-12:30	Session close-out and next steps	AESO

IV. Overall outcomes from the day

The main objective of the session was to understand where stakeholders and the AESO are aligned and misaligned regarding the spectrum of rate design options available, set out by the AESO's rate design bookends (discussed at Session 2) and stakeholders' proposals (introduced and discussed at Session 3). Participants engaged in meaningful discussion and overall, stakeholders agreed that this was a valuable session that allowed them to level set with the AESO about what they had heard in Sessions 2 and 3.

V. Session highlights

Captured below are the highlights of the questions and discussion on a topic-by-topic basis. For a detailed review of the session, please refer to the session recording, posted at www.aeso.ca.

Topic 1: Spectrum of Options

i. Participants were generally aligned with the AESO's recap of proposals:

- There was some clarification from Session 3 presenters about their proposed alternatives.

ii. Stakeholder Commentary

- Some participants expressed concern with the uncertainty of the alternatives shown on slide 24:
    - *Lionstooth Energy:* We have not seen yet to date, the quantitative analysis to show why the change is necessary and whether it's going to create the solution that we're potentially after. We need to be careful as we get into this.
    - *AltaLink:* Alternative C has uncertainty because it is built on the assumption of using 2018 design of the metering practice.
- Clarifying comments:
    - *CCA:* Alternative D mentions the fact that we should give consideration to setting the Non-coincident Peak (NCP) based on marginal charges and the remaining amount would go to billing capacity.
    - *RMP Energy Storage:* Slide 23 assumes that all load customers are looking for the same firm service; can't separate firm and non-firm load customers. Is this something we try to change and allow us to evaluate customers differently?
    - *Alberta Newsprint:* The graph on slide 23 clearly indicates we need to move to the bottom left corner where we have more response. But we're actually moving away from

Public

the corner where we need to be. Because the costs have gone so high, we are throwing away all cost principles and moving away from the corner which doesn't make any sense.

- *Best Consulting Solutions:* The last thing we have heard about the Alberta Self-Supply and Export Policy came last summer from AUC. Have there been any developments since then that would impact the tariff design?

iii. AESO Clarification

- Response to clarifying comments:
  - The inability to evaluate firm and non-firm customers differently is a limitation of the figure the AESO is presenting. The diagram on slide 23 is high level and meant to illustrate a broad perspective.
  - Regarding the Alberta Self-Supply and Export Policy, the Government of Alberta initiated a meeting last week and disclosed that they are running an engagement over the next month that involves two workshops and a survey.

Topic 2: Cost Allocation

i. Participants generally agreed with the AESO's presentation of the options for an embedded approach or a marginal approach to cost allocation:

- Stakeholders were aligned on the fact that there is a decision to be made on the approach taken for cost allocation.

ii. Stakeholder Commentary

- Some participants pushed back on the AESO's comments on cost allocation:
  - *Solas Energy:* The AESO referred back to a study from 2014 – is it still relevant? It is up to the AESO to determine if the study is still relevant.
  - *Solas Energy:* The bulk of our conversation is on the calculation, but not on the location of measure. Where exactly are you measuring this? We're spending a lot of time on the math of *how* it's calculated but not *where* it is measured.
  - *Suncor:* People are responding to price signal, regardless of which billing determinant we use; people will behave according to the signal you send them. The AESO's perspective is a bit misleading or short sighted and we need to look at it more practically. Cost causation does not necessarily align with an embedded approach.

iii. AESO Clarification

- Response to stakeholder feedback:
  - Regarding the 2014 study, it is important to recognize that transmission is a long-term game and that we make investments for the long-term. The AESO is looking for a method that updates our current state.
  - The topic of location of measure has been discussed and evaluated in Alberta in the 2018 GTA proceeding where the AESO put forward a proposal of location and the

Public

commission approved it. Implementation is still in evaluation. This topic has been a discussion that Alberta has had for two to three years.

- Regarding customers' responses to price signal, these concepts are difficult to summarize and the topic will be explored further in the session.

Topic 3: Energy Storage Tariff Treatment

i. Participants generally agreed with the AESO's proposed treatment of energy storage as unique from both loads and generators:

- There was further discussion on the interruptible rate option presented by the AESO.

ii. Stakeholder Commentary

- There was discussion around the interruptible rate option:
  - *Power Advisory LLC:* At a high level, what the AESO has put forward makes sense. It would be helpful to understand what the interruptible rate would be composed of. Is the AESO considering using existing ones or making their own?
  - *RMP Energy Storage:* In our alternative, we were looking at energy as most like a dispatchable generator, therefore paying Rate Supply Transmission Service (STS) is the best option. During charging it would be interruptible by the AESO. STS treatment for tariff but interruptible by charging is the ideal option. The second-best option is a tie-line. It is interruptible, but also paying an opportunity rate where the interruptible component is on a shorter time period.
- Clarifying questions:
  - *CanREA:* Going back to summary of CanREA's position, the "like a substation" part is the most important point. There are issues here with trying to bucket storage with what already exists. A lot of the conversation we've had is that storage is unique because it's not a generator or load – it shares behaviour with both, but it's not any one of those at the same time. We need to have a bigger bucket of thinking including "other" types of facilities that storage is akin to in addition to load and generation.
  - *Capital Power:* Would the AESO look at extending this unique rate option to any participants or only energy storage?

iii. AESO Clarification

- Response to clarifying questions:
  - The AESO would do their best to make the rate as technology-agnostic as possible. We don't have a design yet; it is just an option that we're exploring. However, the idea would be that it would be a rate that any customers who are eligible would get.

Public

Topic 4: Continuing Status Quo

iv. Participants generally expressed concern with excluding past investments from consideration in the future rate design:

- Stakeholders do not want to find themselves with a new tariff design that replicates similar issues of the current design.

v. Stakeholder Commentary

- Many participants discussed the importance of using learnings from past actions to inform the new rate design:
    - *ADC:* In reference to slide 47, we keep talking about how we can't look back. The reason we've gotten into the problem we're in today is because of the network investment from 2014-2019. We invested this money not for load or load growth; it was a policy decision. No load customer in Alberta was responsible for this increase so it is unreasonable to make them pay for it. It is inappropriate to say the past does not matter and forgetting about what happened with the network investment is flawed.
    - *TransAlta:* Whatever billing determinant you use, you'll see a response, which makes it a bit difficult to draw too many conclusions. Slide 49, bullet two, causes some concern. The current rate model was designed to incentivize billing determinants to fall. How do we prevent this from happening in the future? We don't want to find ourselves with a tariff design that creates the same issues in five years, and we don't want to replicate the issues with the new tariff design.
    - *Solas Energy Consulting:* Are there other creative ways of dealing with this other than those presented? The regulatory oversight was needed but now looking back, have we overbuilt the system? Can we deal with this creatively outside of the existing regulatory structure?
- Some participants disagreed with the AESO's presentation:
    - *Dual Use Customers:* Slide 47 shows that Coincident Metered Demand (CMD) has not increased substantially over the last 15 years, which shows that the price signal tariff is working. The 12-CP is intended to have customers avoid the peak and that's exactly what they did. Therefore, it is wildly inappropriate to make the customers who don't use the system to pay for it.
    - *Suncor:* In reference to slide 49, surprised because the AESO is making a case for change but this slide shows going from embedded cost to marginal cost. Challenge to the AESO – reread your own material. The argument is not a case for change to move away from 12-CP; it is a case for change from an embedded signal to a marginal signal.

vi. AESO Clarification

- Response to using past learnings to inform the new rate design:
    - The AESO is operating within our mandate and scope for this process. We are trying to gather information to formulate into the preferred option going forward and we do recognize the comments. The outcome of the current rate design has led to the trends we're seeing today. Unwinding those effects is not easy and we're treading with as

Public

much caution as possible to make sure we're not creating a new version of this problem.

- Response to other comments:
    - In response to Suncor's comment, slide 49 describes the way customers are responding and the lens we're looking at it through is economic. If you look only at the changes and drivers of the transmission projects, that is a case for change from an embedded approach.
    - The AESO recognizes that customers have responded to the price signal.

Topic 5: Additional Complexity

i. Participants generally wanted more clarity on the AESO's path forward:

- What is the AESO's process and plan between today and February to come up with a solution?

ii. Stakeholder Commentary

- Participants asked for clarity on the AESO's process going forward:
    - *Power Advisory LLC:* Want to clarify what's left in the path forward. Are we looking at embedded or marginal cost or is the AESO back to keeping 12-CP or moving to 120 seasonal CP? Is there still more scope to discuss?
    - *DePal Consulting:* Can you talk about the AESO's process? What are you going to do between today and February to come up with the solution?
- Additional questions:
    - *IPCAA:* Has the AESO considered Ramsey pricing? The issue is that there is too much money spent and the AESO is just moving money around. What you need to do is look at a system where the allocation is higher for those customers who do not respond. All the options proposed by the AESO still lead to a response from some customers, with no differentiation.
    - *RMP Energy Storage:* Looking at the classes of customers – currently all of them are paying on the same methodology but we have different classes of customers that want different products. Offering a non-firm rate would enable the system to avoid some of these additional costs, have active participants within the market, and enable us to avoid the issue of stranding some of the investments that have been made. Energy storage can also be a non-firm customer. Is breaking down customers into firm and non-firm categories something that we can look at in more detail?
    - *Power Advisory LLC:* Does the AESO have any sense of what the size of the rates would be if we moved to a marginal approach? It would be helpful if stakeholders could get an understanding of what these options look like before we pass the point where stakeholders can influence the AESO.

iii. AESO Clarification

Public

- Response to questions about the AESO's process going forward:
  - The AESO does have outstanding questions. We are narrowing down and trying to concentrate on the fundamental issues that need to be resolved such as cost allocation (embedded versus marginal) and where those are allocated in terms of the rate design.
  - The AESO has benefited from stakeholder feedback. We are trying to narrow down the list of issues and areas of disagreement and come back with our preference in February. Bill impact is an important component of that, and we are looking at how each option will impact customers and appropriate mitigations.
- Response to other comments:
  - The AESO has heard that the current rate structure has some Ramsey pricing attributes.
  - The AESO has considered the categorization of firm and non-firm customers in our path of minimal disruption.
  - The AESO cannot provide rates for the marginal approach at this time.

Topic 6: Mitigation to Achieve Minimal Disruption

i. Participants generally wanted more clarity on the AESO's two mitigation options of transitional rate design and bill adjustment:

- These was discussion among participants to which of the two options is preferable.

ii. Stakeholder Commentary

- Some participants opposed the bill adjustment mitigation option:
  - *CCA:* Not as concerned about the bill credits as providing the right signals going forward to not only the current customers, but future customers as well. The nature of industry in this province is changing and everyone is looking for the right price signal – this is where the balance lies.
    - *Power Advisory LLC:* In response to CCA's comment, the goal here needs to be what the end states of the rates are so we are sending proper incentives to future customers but disagree that we can't achieve that with a transitional mechanism. Customers aren't making investment decisions off rates today, but off of their understanding of future expectations. All of the concerns raised by CCA can be addressed with a transitional mechanism.
  - *ADC:* Doing a bill credit is the absolutely wrong way to go moving forward. How do you determine how much bill credit one customer should get over another, who decides that? Bill credit also creates issues with fairness. Instead, we need to develop a standby interruptible tariff that works for the customers that have flexibility and adds value to the system.
  - *TransAlta:* Why does the AESO prefer rate design mitigations over bill adjustments?

- Additional comments:

Public

- *Dual Use Customers:* If some customers can respond and some can't, it is irrelevant. We need to send a price signal where customers will respond for the benefit of everybody.
- *Capital Power:* On process and engagement – how can we fairly review the preferred rate design (session 5) without understanding the mitigation path (session 6)?
- *Enbridge:* The Bill Impact Calculation Tool has some mistakes. My suggestion is to add details, such as input boxes, to allow the customers to put in their own contract capacity so it can be more accurate in determining the billing capacity.

iii. AESO Clarification

- Response to discussion of mitigation options:
  - The two options represent the two sides of the coin where we want to make changes to the rate design.
  - The rate design mitigation options are preferable to the AESO.
    - If a customer is more responsive and if their load behaviour creates value for other rate payers, capturing that value using a rate class creates a better outcome than a bill adjustment option.
- Response to additional comments:
    - In response to DUC's comment, this may be an area of fundamental disagreement. The AESO's data shows that the continued cost exchanging between those who can and cannot respond will have a negative impact on load payers for Alberta.
    - The AESO wants to provide the tools and data for stakeholders to understand the rate design and the mitigations. The AESO is committed to trying our best to provide certainty for stakeholders but cannot guarantee it. We are working very hard for the data and analysis so you can comment appropriately and in time for the proposal.
    - Please forward errors in The Bill Impact Calculation Tool to the AESO so they can be rectified.

Topic 7: Areas of Agreement and Disagreement

i. Stakeholder Comments

- *IPCAA:* We can all agree that we want Alberta to be an attractive place for investment and have a rate that works for the province. We need something that works for the long term and the bigger picture is a system that makes us a place that succeeds. Going forward, we need to look at the arguments more through that broader lens.
- *ADC:* Want to raise an area of disagreement – has the AESO analyzed additional incremental investments that we would have had if the 12-CP had not been in place?
- *RMP Energy Storage:* From the perspective of energy storage, there are investment decisions being made right now about generation within the province and without a clear tariff, these decisions will be delayed. There is a bias in the current system and this needs to be rectified in the very near term.

Public

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Colette Chekerda
Comments From:	Alberta Direct Connect Consumer Association	**Phone:**	780-920-9399
Date:	[2021/01/12	**Email**:	colette@carmal.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session compared the proposed tariff suggestions, but didn't provide any evidence or analysis on which to to base a new tariff design or to establish why the current design isn't workable going forward. The best outcome of the session was the acknowledgement that a regional CP will not be considered any further.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	The AESO must consider the embedded costs in meeting the rate design objectives. Customers have invested significant capital in responding to the tariff signal since the policy change in transmission cost allocation in 2005/2006. It was determined at that time that regardless of the cause of transmission need, costs would flow through to customers and it was more efficient to have those flow through the tariff design rather than the pool price. As long as this policy remains unchanged, the embedded costs should continue to flow through in a manner similar to the current CP rate design.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	a) The ADC preference for a mitigation option is through a tariff design establishing 2 rate elements for the bulk system charges: a firm capacity and a non-firm capacity charge. Any bill mitigation options that are customer specific will be difficult to establish in a fair manner and will increase the regulatory burden of all participants. b) The ADC has a tariff mitigation proposal for a firm/non-firm service included as an attachment to this response. c) The tariff design should enable the recovery of the Alberta economy and set up customers for long term success. The rate design needs to maintain the competitiveness of Alberta's electricity intensive and trade exposed industries.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		1. Efficient Price Signals
		
		The tariff needs to continue to have efficient price signals to minimize future transmission build. The system peak matters and a CP price signal is the best way to have flexible loads curtail and signal when standby use of the grid is adding to system stress.
		
		2. Cost Responsibility
		
		Everyone will agree that it is more than just load behavior that drives transmission development. However, our policy is that we have a congestion free transmission system and that load pays for tranmsisison. The transmission development that has occurred has happened to connect all forms of generation that ultimately serve load and need to be able to reliably serve load at peak times. The only way to mitigate future build is to incent load to curtail at peaks.
		
		3. Minimal Disruption
		
		We hope all will agree that if tariff changes result in loads exiting the province that we all have failed in this tariff effort.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		ADC agrees that these are the key areas of disagreement.
		
		Efficient Price Signals
		ADC agrees that the CP method reduces costs for other consumers.
		
		Cost Responsibility
		Both cost causation and cost responsibility need to be considered.
		The AESO could undertake to recreate the historical system peaks without the price responsive load and behind the fence generation to determine how much more transmission development would have been required to meet peak loads. Without this analysis, we submit that it is incorrect to assert that load behaviour has not influenced these costs.
		
		Minimal Disruption
		It remains unclear what shuffling costs amoung customers will do to stop the bleeding. If province is truly concerned about the impact of transmission costs on customers, they need to address that in a review of transmission policy and who pays.
		If the AESO pursues rate mitigation that is temporary through a bill impact model, that will not change the outcome for price sensitive loads. If these loads know that their rates will be unaffordable in a future year and other options such as self supply become limited they will have no option but to exit the grid.
		Regardless of the tariff direction, the AESO needs to re-examine the notice and PILON provisions for changes to the DTS contract capacity.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	The ADC would support the effort of examining a firm / non-firm tariff that is minimally disruptive to firm, price responsive and standby customers.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		ADC is generally supportive of the areas of agreement.
		
		Any storage tariff should be based on cost causation principles which should be technology agnostic.
		
		A firm / non-firm tariff could also work for storage assets.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	The tariff should incent storage to locate in areas that are the most cost efficient for Alberta consumers. For example, storage co-locating with intermittent generation or load could reduce the need for future transmission investment. If storage requires an interconnection that triggers additional transmission costs for charging, then they should have a cost responsibility for POD, regional, and CP bulk charges.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	ADC believes a well designed firm/non-firm tariff could provide a tariff solution for price responsive, standby and storage users of the grid.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	The ADC submits that any tariff proposal needs to be modelled for rate impact. Note that ADC can't support any change that would render our members uncompetitive in Alberta.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	Not at this time.
12	Additional comments	The ADC is putting forward a rate mitigation tariff proposal for the AESO's consideration. We are available to discuss the concept and merits of the design.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Surendra Singh
Comments From:	Alberta Newsprint Company	**Phone:**	780-778-1537
Date:	2021/01/11	**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Since in next session on Feb 25, 2021, AESO is planning to present their preferred rate design, we were expecting that this session would have much more analytic work and detailed analysis of various aspects to justify if any changes are needed in the current tariff design. The session was heavy on high level concepts/ideas and lacked in any material/analysis/data supporting them. We are pleased to see that AESO is not pursuing the idea of dividing the province in to 6 regions as it would have very unfair with no opportunity to manage transmission charges for the flexible price response load in the North West region.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	AESO has not been able to provide any compelling reasons for changing from current practice of embedded cost. To make this decision, AESO should have initiated a similar study as was done by London Economic in 2014. The pros and cons of Marginal cost and Embedded Cost were carefully discussed in London Economic report. In the absence of any study/analysis, AESO should refrain making such as critical decision and therefore should continue to use embedded cost.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	The mitigation option has to be through "Rate Classes" as a part of "Rate Design". It would have been very helpful if AESO has included in their presentation some analysis/design criterion on such as Interruptible/Standby rate classes. AESO needs to recognize that there is a significant and real risk of large energy intensive industrial consumers leaving the grid to manage their electricity cost if significant changes in tariff design were to be implemented without proper rate mitigations through rate design. Large industrials leaving the grid completely is not in the interest of consumers with even higher transmission charges.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		We are agreed that "Efficient Price Signal" is one of the key criterion for tariff design. And this has been the case since AUC directed AESO to use 12CP method for allocating Bulk system cost in 2005. It is clearly evident from slide 47 of AESO presentation in Session 4 that even though DTS contract MWs (and likely total energy usage MWh) have increased, the peak CMD demand load has not increased much. This is exactly what an efficient tariff design should do and that's why CP method has been used in a large number of jurisdictions.
		
		Increased transmission cost does not change the fundamental principal of cost causation. We have been practicing our peak load management since CP charges were less than $1500/MW. For some transmission lines, there may be some other reasons for building, but at the end of the day, it's the load who pays the transmission charges and should be incented to minimize the need for future build.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		The current price signals including 12CP are efficient which in turn reduces the cost of all the consumers by eliminating and/or delaying the need of additional transmission.
		
		The current rate design is equally applicable today as it was in 2005 when approved first time and being approved several times since then.
		
		The problem is not the cost allocation method in tariff design; it is the total cost. It will do no good to lower the transmission cost of small consumers (residential/commercials) by a few dollars per month while rendering energy intensive large industrial load unviable by increasing their transmission cost by over 100% to 130%.
		
		We support the proposal put forward by ADC of nominating firm and non-firm load for bulk system charge with the expectation that non-firm load will be curtailed during system peak or pay much higher charge if failed to curtail. By this nomination, AESO will need to plan only for firm load during peak hours.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner	

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	We are concerned that there is not enough time from now to the filing with AUC for doing a thorough analysis of any changes. AESO should undertake a similar study as was done by London Economics in 2014. There is a need to have a strong quantitative support to justify any changes from current tariff design.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	Please provide details as soon as possible on various rate classes such as Interruptible/standby.
12	Additional comments	So far AESO has not provided any solid support for changes other than their desire to change. The proposed changes are anything but modernization of tariff. We don't see any need to change the current design in any significant way.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Hao Liu/Rob Senko
Comments From:	AltaLink			**Phone:**	(403) 710-1247/(403) 874-6762
Date:	2021/01/12			**Email**:	Hao.liu@altalink.ca/Rob.senko@altalink.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was useful because the AESO stated what they have heard from stakeholders, providing stakeholders the opportunity to clarify or correct the AESO's interpretation of stakeholder feedback. The session was also useful in that the topic of rate mitigation was introduced.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	As load growth is not the primary driver of new transmission, a study determining load's marginal cost of transmission will not effectively reflect cost responsibility of province-wide transmission costs. A marginal cost-based price signal could be useful in locations where there might be load-driven incremental transmission. However, the requirement for postage-stamp transmission rates precludes this type of rate design. An embedded cost allocation approach has been used in Alberta for some time. It has the advantage of allocating all embedded costs based on a chosen cost allocation method. A cost allocation method grounded in planning principles and customer use can and should reflect cost responsibility. 12-CP does not meet these criteria.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	The AESO presented a comprehensive list of mitigation options. AltaLink supports an option that results in a just and fair transition to new rates. Customers who made investments under current rates must be treated fairly. Ideally, the rates under a planned transition should be known so that there is some cost certainty for customers in the future.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		AltaLink agrees that price signals matter. The structure and levels of prices will influence customers' use of the system. Poorly designed tariffs could encourage development of otherwise uneconomic behind the fence generation that will shift transmission costs to other customers.
		
		AltaLink agrees that more than just load behaviour drives transmission development. Even where load behaviour is not the driver of transmission development, the regulatory framework requires the costs be recovered from load. Cost responsibility should include a recognition that customers connected to the grid benefit from the connection, independent of usage.
		
		AltaLink agrees that it is important to minimize disruption due to rate changes. However, minimal disruption should not be the primary objective in the AESOs rate design process. AltaLink supports the AESOs statement (slide 20) that they 'need to take a long term view on how to make transmission cost recovery sustainable.' A sustainable rate design should be principle-based; any necessary rate change mitigation plan should be developed separately.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Efficient Price signals
		• AltaLink does not agree that the status quo (i.e. 12CP) price signals are efficient. Current price signals have not resulted in decreased transmission cost. Further, in attempting to avoid monthly coincident peaks, loads respond in many hours which likely results in a distortion to pool prices that is neither efficient nor desirable.
		• AltaLink agrees that price signals are forward looking because they will influence future behaviour. However, there is sufficient capacity in much of the system such that incremental changes in load do not significantly impact transmission costs. In such circumstances price signals should not discourage use. An efficient tariff is going to price transmission in a way that does not cause customers to exit the system.
		• There may be locations where incremental changes in load do have more influence on future transmission costs. However, location specific prices are precluded by postage stamp rates. To achieve efficient signals in these areas the AESO should therefore look to the use of non-wires alternatives, location-based credits and demand opportunity service (DOS) when evaluating options against building future transmission.
		Cost responsibility
		• The primary objective is cost recovery. The current transmission costs are fixed and must be recovered from all customers that are connected to the grid. The fact that, at this time, transmission costs are not primarily driven by load lessens the importance of cost causation in comparison to cost responsibility. AltaLink believes that the value of being connected to the grid is a key component of cost responsibility.
		• AltaLink does not agree that the current rate design achieves the goal of cost causation. The current rate design leads to load changes that do not influence transmission costs resulting in cost shifting.
		Minimal disruption
		• AltaLink agrees that now is the time to take steps to stop the bleeding. As per the AESOs January 4, 2021 letter, 'the earliest the new rate design would come into effect is 2023.' Today's economic climate should not dictate an efficient and sustainable rate design. The mitigation measures will

		allow fair transition to a new rate design and will be influenced by the economic climate at the time of implementation. • AltaLink agrees with the AESOs statement on slide 57 that a mitigation path will depend on the rate design. As a guiding principle, AltaLink believes customers need to have certainty in their tariffs in order to invest in Alberta.
6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	AltaLink would like to see the AESO produce a roadmap to its desired end state of an optimal rate design if the AESO is unable to make its desired changes at this time.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		AltaLink agrees with these statements.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	AltaLink believes that, unless energy storage is in service as strictly a transmission asset, energy storage should be allocated a fair charge for being connected to the grid.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	No comments.
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	No comments.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	No additional questions.
12	Additional comments	No additional comments.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Tony Martino,
Comments From:	ATCO Electric		Dan Thackeray
Date:	2021/01/12	**Phone:**	780-420-5493 (Tony)
			780-721-4284 (Dan)
		Email:	tony.martino@atco.com
			dan.thackeray@atco.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session held on Dec 10, 2020 was well organized, well attended and allowed for reasonable opportunities for the various parties to ask questions and seek clarification.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	While there are various pros and cons to both embedded and marginal cost allocations, where possible and where practical, preference would be to assess cost allocations based on marginal costs that results in costs (and in turn tariffs) being assessed in real time and with a view towards where current and future costs are being incurred. However, it is important to note that with increases in AESO revenue requirement now being a slower rate, relative to the growth experienced over the last number of years, that embedded cost allocation is still going to be relied upon with respect to many aspects of AESO's tariff.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	a) Mitigation processes that minimize disruption are highly important. While many options are available, any type of grandfathering provisions will be difficult to administer. As such, bill credits carried out through a transitionary process appear to strike the most appropriate balance. b) There are many mitigation options that have been utilized in other contexts (for example, rate caps, grandfathering, revenue to cost ratio (R/C) bands (for example, 95% to 105% R/C) and so forth. However, for these purposes, transitionary bill credits appear most suitable. c) The AESO needs to achieve a balance between the status quo rate design and the alternative rate design and that allows for various stakeholders to adjust to the transition while administering appropriate cost recovery and providing efficient price signals. The objective is to ensure that stakeholders, who have made economic decisions based on the current tariff structure, are able to adjust to a change in tariff structure over time.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		In general, ATCO Electric is supportive of the areas of agreement presented at Session 4 and provides the following comments:
		
		Efficient Price Signals:
		This area of agreement illustrates that parties are cognizant and fully aware of the importance of price signals in incentivizing efficient customer behavior. All parties appear to appreciate that efficient usage behavior improves system reliability and helps minimize the cost of the Alberta transmission system in the long run.
		Cost Responsibility:
		The system continues to evolve, and parties understand that transmission costs need to be attributable to both load customers and generation customers. As well, the system needs to reflect the current state as well as the future state of transmission development.
		
		Minimal Disruption:
		Finally, and most importantly, it is positive that all parties appear to fully appreciate the importance, in the event of fundamentally changing a tariff structure, of minimizing disruption, and ensuring that rate shock is mitigated. All parties appreciate and agree that potential reductions in load and/or increased grid defection, resulting from an improper tariff structure, are issues that need to be addressed.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		ATCO Electric considers the areas of disagreement presented at Session 4 to be areas that need to be resolved and offers the following comments.
		
		Efficient Price Signals
		Efficient price signals are extremely important, but the price signals must also be fair and widely available to be adopted by all stakeholders. The current Coincident Peak (CP) price signal is not widely available to allow for proper responsiveness by all stakeholders.
		
		While CP price signals may be forward looking, other prices signals, such as NCP, are also forward looking and, more importantly, are not discriminatory and provide fair treatment and opportunity for responsiveness across all stakeholders.
		
		Cost Responsibility
		While cost responsibility is an important cost allocation objective, ultimately more weighting should be accorded to the principle of cost causation when it comes to determining cost allocations.
		
		Minimal Disruption
		While the Alberta Economy has been negatively impacted lately and while there is concern with respect to making changes to AESO tariff structure during these challenging times, it is expected that by the time a new tariff is implemented, the economy may stabilize. As well, the concept of providing transition bill credits is a solution towards addressing any potential material bill impacts to stakeholders.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	No. There are no other considerations in addition to those discussed above that the AESO should include in its rate design proposals.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		In general, ATCO Electric agrees with the areas of agreement noted and offers the following comments.
		
		Energy storage is unique in that it is not solely a producer or consumer of electric energy.
		
		All three cases – energy price arbitrage, operating reserves and non-wires solutions are markets within which energy storage operates
		
		FEOC principles should be applied for Energy storage solutions relative to the totality of the electricity market.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	The areas of disagreement that are listed summarize the areas of contention from the session. These are areas that would benefit from a wider, more direct consultation on the policy direction of energy storage within the tariff, as the inclusion of energy storage in the current review introduces additional contention. See additional comments below: • Energy storage may be a user of the grid (e.g. energy price arbitrage), a component of the grid (e.g. non-wires alternative), or conceivably for some applications may be viewed as both. • There was no agreement on use cases, nor payment structures on in and out flows from energy storage facilities • Payment structures for various cost components have not been agreed to, and would benefit from a more direct review with impacted stakeholders in isolation of the tariff review.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	As ATCO Electric stated in comments provided to the AESO in the previous stakeholder session, treatment of these types of facilities within the tariff need to be broached with caution and examined thoroughly to avoid unintended consequences associated with policy change. The AESO should consider a thorough review of the application of Energy Storage **in isolation** of this rate design consultation in order to assess all implications impacting energy storage connections (which would include an assessment of rate design for these types of customers).

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	See notes in (9) above. ATCO Electric maintains that a separate, focused review on energy storage as a facility would be beneficial for the AESO in tariff design.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	ATCO Electric has no further clarifying questions at this time.
12	Additional comments	ATCO Electric has no additional comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Evan Wilson
Comments From:	Canadian Renewable Energy Association	**Phone:**	
Date:	2021/01/12	**Email**:	ewilson@renewablesassociation.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	CanREA submits that a balanced approach is most appropriate. To remove price signals completely will result in inefficient behaviour by market participants. It is reasonable to motivate participants to limit both their NCP and CP demand.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	Mitigation is necessary to reduce unexpected economic disruption to industry and to reduce stranded capital for those market participants that have made investments under the current tariff structure. To reduce immediate adverse impacts to industry in the middle of economically difficult circumstances, CanREA suggests that it may be appropriate for the AESO continue to design a sustainable tariff structure, but delay implementation for two or three years. This approach will: 1) Provide a sustainable cost recovery structure in the long term 2) Avoid adding to the current economic turmoil experienced by industry 3) Allow market participants to plan and invest based on the long term structure. ***However, the tariff treatment of energy storage resources needs to be addressed immediately as the current tariff treatment is a roadblock to energy storage development***.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Efficient Price Signals
		CanREA submits that price signals matter. Significant system savings can be realized through appropriate market participant behaviour.
		Minimal Disruption
		Minimizing disruption will reduce the risk of stranded capital for those market participants that have already made investments based on the current tariff rate structure.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
		Minimal Distruption
		CanREA understands the AESO's argument that the current tariff structure may not be sustainable. CanREA also understands the concern from industry that the sustainability of the tariff design can be addressed once the current economic turmoil has subsided.
		CanREA submits that a delay of major tariff design changes of up to three years is unlikely to destroy the long term ability to pay for the transmission system. At the same time, it would be helpful to provide certainty to industry about what the ultimate tariff structure will be. Providing clarity now will allow industry to plan and make investments based on a future structure without contributing to immediate economic difficulties.

	Cost Responsibility • Is the primary objective cost causation, or cost responsibility? • Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs? **Minimal Disruption** • Now is not the time for change or time to stop the bleeding? ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively • Does rate mitigation need to be permanent or will customers adapt if temporary?	CanREA reiterates that immediate changes to the tariff are required where they relate to the treatment of energy storage***. In fact, it is essential that the next tariff filing to remove the unfair barrier represented by the current tariff treatment and allow energy storage to provide the many system benefits that are being realized in many other jurisdictions***.
6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		CanREA is supportive of all the areas of agreement relating to energy storage presented at Session 4.
		We agree that energy storage is a unique technology. However, becuase storage is unique, it is neither fair nor efficient to treat it like other technologies. Because they are unique, load, generation and provincial interties receive different tariff treatment. By that measure, storage is unique and it follows that fair and efficient tariff treatment should be applied to tariff facilities.
		The current tariff treatment, which does not fully consider the unique nature of storage, has created an artificial barrier to investment.. If the tariff barrier is not removed, it is unlikely that the full range of services provided by provided by energy storage technologies will be deployed to benefit the grid.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:**	**Energy Storage as a User of the Grid or Component of the Grid** There may be storage facilities that operate as users of the grid or components of the grid or both.

	• Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	**Payments for Inflows and Outflows** The phrase “like every other network user” is not useful in this context. This phrasing suggests that storage should pay the current tariff, as if it is simply a load customer. This is not appropriate, as storage is not load. If storage is operating like a component of the grid, such as providing a non-wires solution to reduce transmission congestion, providing grid support services or deferring transmission construction, then the storage facility is supporting the grid, rather than using it. In this case, no tariff charges should be levied. When a storage facility is a market participant and is operating like a user of the grid, it is appropriate for the facility contribute to network system costs. To identify a just and reasonable share of the costs, the AESO should examine the justification for the rate for Export Opportunity Service (XOS) and Demand Opportunity Service (DOS) as these are the two existing ISO tariff services that use the system in a manner that is closest to the way storage will use the system. It should be noted that this discussion does not address the “double double” problem that had been raised by CanREA and Solas Energy Consulting during previous stakeholder sessions. The “double-double” problem refers to the fact that electrons stored and returned to the grid are already charged STS tariff rates to the original generator and DTS tariff rates to the ultimate end user. Therefore, charging tariff rates to the storage facility results in double charging for those electrons for both the grid injection and grid withdraw behaviour. CanREA has previously proposed that an Administration Fee is an appropriate mechanism to avoid the “double-double” problem, but recognize that the limits of the current Bulk and Regional Tariff discussion may not be sufficiently flexible support this approach. Other mechanisms that have been considered include: 1) A storage specific tariff rate which recognizes the uniqueness of energy storage but does not address the “double-double” problem. 2) A new Interruptible Demand Service that would not be technology specific and does not address the “double-double” problem, but may be more acceptable to a larger group of stakeholders and which the AESO may feel more able to justify.

		These options would both likely be more economical than the current tariff treatment, but further details will be required in order to properlyanalyse the impacts of any AESO proposal. While any one of the three mechanisms described above may, at the appropriate pricing level, remove the barrier to storage development that is caused by the current tariff treatment, CanREA emphasizes that this feedback has been given within the context of the Bulk and Regional Tariff re-design process and in the current regulatory and legislative environment. Given the unique nature of storage, there are further policy changes needed to ensure fair and efficient participation of energy storage resources in the Alberta electricity market. CanREA acknowledges that the current tariff process is not the appropriate venue to debate these changes, but is clear that the choice of a tariff mechanism within the current process, which does not adequately reflect the unique attributes of storage facilities, will not remove the need for future regulatory and/or legislative changes. CanREA anticipates that regulatory and legislative changes may have an impact on future tariff options, leading to mechanisms and rates that are more appropriate to reflect the unique nature of storage technologies. **Storage Payments for Administration, Operations and Maintenance, Pod, Regional and Bulk Charges** CanREA notices that XOS and DOS charges are not broken down into the cost categories listed and therefore it is not necessary to separate the energy storage tariff rate into those categories. If necessary, the AESO may determine how tariffs collected from energy storage contribute to each of the cost categories, just as the AESO does with revenues collected from XOS and DOS.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Energy storage is considered to be unique because it shares characteristics with a number of different – and sometimes competing – technologies, including those that operate as market participants and as components of the grid. The key to supporting fair, efficient, and openly competitive market participation is enabling the purchase of certain reliability products that can be provided by energy storage and other facilities. The AESO should consider the three mechanisms described in our response to Q 8. Given the minimal incremental system costs of storage, the tariff rate for withdrawing energy from the grid under the chosen mechanism should be far below the rate resulting from current DTS. We reiterate that the proposed rate should be similar to those resulting from XOS and DOS treatments. More discussion will be required to establish the details of the chosen mechanism.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	More time is requested to address energy storage issues during the upcoming consultation sessions.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Matthew Davis
Comments From:	Capital Power			**Phone:**	403-540-6087
Date:	2021/01/12			**Email**:	mdavis@capitalpower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Capital Power appreciates the opportunity to provide comments on the December 10th, 2020 stakeholder session. The session struck a balance of discussing market participant's proposed rate designs, introducing the concept of mitigation options, and broadly indicating the AESO's intentions on changes to the bulk and regional tariff. Capital Power is supportive of the AESO's direction to move away from the status quo (12 coincident peak or "12-CP" methodology),[1] and looks forward to reviewing the AESO's detailed bulk and regional tariff design with mitigation options presented in session 5. The details will be important, and Capital Power suggests that with the session materials the AESO intends to publish, it includes mitigation options within its bill impact calculator to clearly illustrate the benefits of the mitigation options.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	Capital Power understands that the embedded and marginal cost approaches need not be an either / or discussion and regulators have used both when designing rates.[2] Capital Power suggests that the AESO consider the benefits of using both allocation approaches appropriately to support its design objectives. While a marginal cost approach aligns with sending efficient price signals and may provide opportunities for additional innovation and flexibility, it requires a complex handling of re-allocating existing costs to ensure cost recovery. Further, a marginal cost approach would require determining the marginal cost of transmission, which Capital Power suggests is not likely a simple exercise, but one that could better inform future tariff development. As there is a significant requirement to reflect overall existing system costs and the benefit that customers receive from the grid, Capital Power views an embedded approach to most appropriately align with the AESO's objectives around cost responsibility. Additionally, its current use aligns with the simplicity objective. Capital Power sees the objectives around minimal disruption and creating opportunities for innovation and flexibility as being enabled through the mitigation options discussion.

[1] AESO Session 4 Presentation, Slide 28.

[2] e.g. Synapse Energy Economics, Inc. Ratemaking Fundamentals Fact Sheet which states that "some regulators rely on embedded cost studies to allocate costs between classes, and then use marginal cost information to inform rate design elements (such as inclining block rates or time-varying rates) within classes."

3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	a) Capital Power is supportive of the AESO designing mitigation options that focus on rate design over those that focus on bill adjustments. Creating additional options based on service level expectations and market participation allows for a more sustainable, customer-oriented design for the tariff going forward. A gradual and phased approach to transitioning the rate design vs. an abrupt change will mitigate the rate of regulatory change. When coupled these two mitigation options provide existing and future consumers several ways to manage their transmission costs. The use of bill adjustments appears more arbitrary and less aligned with FEOC principles, particularly permanent reductions. This option creates many questions such as: who would be eligible, what quantum of adjustment is allowable, who would arbitrate the process, and why past behaviour should infer current and future benefits. Capital Power is not supportive of the AESO pursuing this option. b) c) The AESO's use of mitigation options as strategies has the potential to alleviate the impact of changes to the tariff not just on existing consumers but also future consumers. This is essential as customers are looking for additional options to manage their transmission costs. In creating an interruptible service, Capital Power suggests that there is an opportunity to create a technology neutral rate option that would suit energy storage projects. Specifically, if the AESO designed a rate for any sink resource that commits to bidding into the market and adhering to the market rules, such a rate could also apply for energy storage assets when charging. This would alleviate Capital Power's concerns on creating a technology specific rate for energy storage.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Capital Power is generally supportive of the areas of agreement identified. Specific details follow:
		
		Efficient Price Signals: Capital Power believes that the price signals generated through the rate design matter greatly and have the potential to create opportunities to unlevel the playing-field and distort the energy market signal for investment. Capital Power has observed a trend of generation development that is designed to avoid current transmission rates and is concerned that the tariff signal is supporting investments that may not be borne out of the energy-only market signal alone. This is a clear indication of how the current price signals sent through rates are creating incentives for customers to alter their behaviour. As the AESO modernizes their bulk and regional rate design, it should take great care in understanding how its rate design impacts the energy-only market price signal, particularly given current uncertainty around self-supply and export opportunities. The AESO's rate design should provide customers with options to remain on the system and be attractive to new investment – only with increases in overall load will transmission costs lower for all customers.
		
		Cost Responsibility: Capital Power agrees that the transmission development is driven by more than just load but would note that discussions around the transmission development policy and load's cost responsibility is out of scope of tariff consultations. Capital Power believes that there is value in accessing the transmission system as it provides customers a highly reliable source of electricity, and access to the competitive wholesale market.
		
		Minimal Disruption: Capital Power is aware that with rising transmission costs, the overall delivered costs for consumers is rising. The total cost of the transmission system is largely sunk, as such, within the confines of the tariff design discussions the AESO is limited in their options to lower costs for all customers. The AESO can create mitigation options that better reflect customer's service level expectations, allowing customers that are more elastic to price greater options. This can create a positive feedback loop and grow overall demand – which would lower prices overall. Without mitigation, there is a real concern that load destruction could occur which is disadvantageous to all Albertans.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Capital Power submits the following comments with respect to areas of disagreement:
		
		Efficient Price Signals: Capital Power understands that the current tariff signal was set at a time where incremental transmission build out was occurring, as such, its design to lower peaks deferred or reduced the need for additional transmission. Much of that infrastructure is now built out and the tariff needs to recognize the benefits of the existing transmission system, and its existing costs. As such, while a marginal cost allocation approach would set a forward looking price signal, Capital Power is concerned that it would require significant, complex, modifications to fully recover the costs of the existing system, eroding the strength of a forward-looking price signal. Instead of adding this complexity at this time, Capital Power views the AESO's work on rate classes as an opportunity to better send price signals that align with the need for future transmission costs, and how customers value their connection to the grid.
		
		Cost Responsibility: The AESO has indicated that the bulk of the transmission costs are sunk, and ultimately there is a responsibility to recover those costs. Capital Power believes that the current design does not accurately achieve its stated objectives as it creates equity concerns amongst customers, and un-levels the competitive playing field.
		
		Minimal Disruption: Capital Power understands the sentiment to pause due to uncertainty but believes that providing clarity on tariff design is essential for investor certainty. The concerns with the current design have been well known and providing clarity now will allow for the development of an orderly transition that will allow industry time to plan for the future structure.
		
		Capital Power notes that the AESO's rate transition mitigation option is, by definition, temporary. Mitigation through the creation of new rate classes for differentiated service should be permanent and while supportive of the endeavor, Capital Power suggests that calling it a mitigation is a misnomer. While Capital Power is not supportive of the AESO pursuing bill adjustments as a mitigation, if done, would recommend it be temporary.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	Please see discussion above.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Capital Power supports the AESO's conclusion that energy storage is unique but notes that each service it provides to the grid is not.
		
		Capital Power disputes that energy storage can participate as a non-wires alternative at this time. While it is a plausible use-case, there are policy questions that need to be determined such as whether regulated or de-regulated investors can develop non-wires alternatives. Capital Power expects that this issue will be addressed separately and that any non-wires alternative energy storage project would adhere to applicable tariffs, and not be granted any special tariff.
		
		Capital Power believes that any assets participating in either the energy or ancillary services markets should be held to the same standards, regardless of technology. This is essential to maintaining a level playing field that is foundational to Alberta's FEOC market.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	Capital Power believes that the policy implications of the first question are out of scope of this discussion. Energy storage use-cases focused on energy and ancillary market participation clearly align with storage using the grid. Energy storage as a component of the grid has profound policy implications around what regulated utilities can invest in, how the AESO plans, and the role of non-wires alternatives. With respect to the following three questions, Capital Power reaffirms its position that the AESO develop technology agnostic rates in which energy storage is able to align how they use the transmission network with other market participant who behave similarly. All market participants are responsible for procuring the necessary fuel for producing electricity. Energy storage should not be treated differently just because its fuel source is electricity itself. Transportation costs, which for energy storage are costs associated with the network, are part of the equation when setting offers and should not be absolved for one technology over any others. Capital Power would like to indicate that through the introduction of differentiated rate classes as proposed in the mitigation discussion above, it is possible to design a rate that would align with an energy storage use case that would see outflows offer into the market just as source assets do today, and inflows bid into the market. A rate design that is set around any market participant that is willing to bid into the market could align with energy storage use-cases while maintaining technology neutrality in the tariff.

9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Please see discussion above
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Capital Power suggests that the AESO advance as much as possible the rate design mitigation options, particularly any new rate classes. It appears that there are opportunities through that discussion to resolve many of the issues for both customer costs and energy storage treatment.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	Not at this time
12	Additional comments	Capital Power appreciates the AESO's efforts on this issue. This work is very much interdependent with other issues in industry, particularly the DOE's self-supply and export consultation. As the AESO illuminates its preferred design, it will be critical to understand the alignment with other issues.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Raj Retnanandan
Comments From:	CCAS			**Phone:**	403-992-2258
Date:	[2021/01/12]			**Email**:	retnanandan@emrc.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Was helpful
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	During the session certain parties repeatedly asked about Ramsey pricing. Under Ramsey pricing the AESO would price service to those customers who had alternative choices at close to their avoided cost of self supply. This means the remainder gets spread across all other customers. The economic rationale being, by virtue of retaining the choice customers and their contribution to fixed costs, all customers are better off. Unlike in the past when, only ISDs were allowed to create microgrids, the choice customers who have a legal right to create micro grids now includes many others such as Indian Bands, Institutions etc., who can demonstrate community benefits.[Small Scale Generation Regulation] Given all this, it is better to provide marginal cost signals to everyone who is using the system and responding to price signals for their incremental use. Clearly, under this approach, the difference between MC and AC needs to be dealt with. One approach would be to bury this difference in a fixed connection charge which is not usage sensitive. The fixed connection charge could be established in declining blocks so that at the margin, it too reflects marginal costs.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	In CCA's view mitigation of rate increase arising from restructured rates should occur at the bill level. Rates should be restructured to reflect the go forward rate design as soon as possible to reflect the evolving electricity system with two way flow of electricity.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Agreed

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Agreed

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	Please refer to Option D presented by CCA

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Agreed

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	Agreed
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	CCA does not take a position on this at this time.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Agreed on process
11	Do you have additional clarifying questions that need to be answered to support your understanding?	
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Grant Pellegrin
Comments From:	Cenovus Energy Inc			**Phone:**	403-766-3955
Date:	2021/01/12			**Email**:	grant.pellegrin@cenovus.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was moderately valuable, although it is interesting to see what other parties' position is, it would be valuable to get more information from the AESO on the AESO's position and the supporting analysis and cost causation studies to justify the AESO's position.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	Both embedded and marginal costs need to be incorporated into rate design objectives, both past and future investment decisions impact the current and future transmission system and should be reflected in rate design.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	At this time CVE does not have a preferred mitigation option but offers that if needed; rate mitigation will need to be specific to the impacted customers, respecting their investments and the impact their actions have made in alleviating the need for transmission to be built. Rate mitigation will also have to work for those customers, many of which will compete in international markets and their cost structures need to be competitive to keep these industries, consumers and economic benefits in Alberta.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Yes, Cenovus is generally supportive of these areas of agreement.
		Efficient Price Signals:
		Price signals are a critical aspect of rate design and have a long history of incenting behavior to maximize the value of the system for all customers – reducing use during peak periods, incenting use during off-peak periods etc. etc. 12 CP has been an effective method of encouraging customers to avoid using power during peak times, likely reducing the overall need for transmission build.
		Cost Responsibility:
		Whether directly built for load or built for new sources of generation that serves load, arguably generation and transmission are only built to sell to/serve load; or serve with a different product type (renewable). Regardless of reason it is clear in the Transmission Regulation that the cost responsibility is with loads receiving power from the T&D systems.
		Minimal Disruption
		The rise in transmission costs was forecasted well in advance of our current situation and a known outcome of the investment in the transmission system. Minimal disruption is important, as is mitigating rate shock as the only long-term solution to lowering transmission costs is to increase provincial load, part of that is to retain the load we have.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Efficient Price Signals:
		
		Efficient price signals are an integral component of proper rate design, CVE believes the status quo price signals are efficient and point to the prevalent use of CP in many other markets as support for that statement.
		
		Cost Responsibility
		
		Both cost causation and cost responsibility are important factors in rate design.
		
		The AESO has not shown that the initial rate design has not lowered transmission costs, it has not been shown that transmission costs would not have been higher but for the rate design nor has it been shown that on-site cogeneration has not reduced the required transmission build
		
		Minimal Disruption
		
		Change for the sake of change is not necessary, cost causation and the proper allocation of costs should continue to be the focus of rate design. Tariffs are approved for certain periods of time and if changes are required should be implemented as necessary.
		
		Customers will continue to seek the most cost-effective solutions to satisfy their power requirements, both rate design and temporary/permanent mitigation will only work if the cost of electricity is competitive with alternatives. If the cost of electricity is not competitive with alternatives customers will find a way of adapting, including exiting the system if necessary. Both the ability to attract new load and retain existing load will be integral components of lowering transmission costs for all consumers.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	The AESO should include any cost causation analysis that supports the proposed rate design proposal.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Under the caveat that energy storage should pay transmission costs based on cost causation principles CVE generally agrees with these areas of agreement.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	There does appear to be disagreement amongst stakeholders in these areas
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Energy storage should be enabled with FEOC principles and tariff design based on cost causation in mind.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Effective rate mitigation will be a complicated process to properly enable and a considerable amount of time and consultation with impacted stakeholders should be taken if rate mitigation is required.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	CVE would like to see a cost of service study for the AESO's rational for pursuing the proposed rate design at this time
12	Additional comments	The review of the bulk system charges is going to be a time consuming and expensive process. There are other initiatives that could impact tariff charges going forward – Transmission Regulation, Self-supply & export, distribution inquiry to name a few. Resolving these issues should be done in advance to ensure whatever bulk system changes are required reflect any changes to those regulations.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Calgary, AB T2P 0L4

Dear Mr. Hall

SUBJECT: Bulk and Regional Tariff Design Stakeholder Session

I write on behalf of the cities of Lethbridge and Red Deer, who wish to share their feedback on the presentation and materials from the AESO's December 10th session. Following that session, the AESO requested parties to respond to questions. The cities' response is provided below.

Question 1:

Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?

The cities consider the AESO's December 10th session to be useful in summarizing where there is general agreement amongst proceeding participants and where there is more entrenched disagreement.

Question 2:

Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?

As discussed in our previous response to question 2 last November, the cities consider an embedded cost allocation method to be a more practical approach. This is also more consistent with Bonbright's "practical-related" rate design attributes.[1]

A marginal cost approach to allocating transmission costs is problematic because marginal cost is only a theoretical concept. In the short-run the marginal cost of an incremental unit of capacity is virtually zero (the additional cost to provide one more MW of capacity is negligible) and determining the long-run marginal cost of additional capacity is still highly dependant on multiple assumptions, all likely to be controversial and add additional regulatory debate, delay and cost. Moreover, the long-run marginal cost will not look much different than embedded cost, apart from inflation.

Question 3:

a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not?

b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify.

C7) What do you think the AESO's needs to achieve with its mitigation(s)? Why

As discussed in our previous response to questions 2 and 3 last November, the cities prefer a phasing-in approach to any of the bill adjustment approaches. The

[1] See page 384 of Principles of Public Utility Rates: Practical—related Attributes: 9. The related, practical attributes of simplicity, certainty, convenience of payment, economy in collection, understandability, public acceptability, and feasibility of application.
10. Freedom from controversies as to proper interpretation.

fundamental problem with a bill adjustment approach is that it does not encourage new (and preferable) customer behaviour. Existing customers have already demonstrated that they can respond to a price signal. The purpose of updating the AESO rate design is to provide a different price signal in order to incentivize behaviour that is beneficial to the system. If bills are adjusted, then there is no or limited reason for these customers to adopt the desired behaviour. The cities also note that at this point it is not clear that any mitigation measure will be needed, depending upon what new price signal is chosen and how quickly the price-responsive customers react.

Question 4:

Are you supportive of the areas of agreement presented at Session 4? Why or why not?

Based on the discussion and submissions to date, the cities would consider there to be general agreement on the issues highlighted by the AESO.

Questions 5:

Are you supportive of the areas of disagreement presented at Session 4? Why or why not?

Based on the discussion and submissions to date, the cities would agree that the areas highlighted by the AESO represent the issues of greatest disagreement.

Question 6:

Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.

Given the relative positions of the various parties on the main areas of disagreement, the cities are unable to offer any additional insights as to how to move parties from areas of disagreement to agreement.

Question 7:

Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?

Based on the discussion and submissions to date, the cities would consider there to be general agreement on the issues of energy storage highlighted by the AESO.

Question 8:

Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not?

Based on the discussion and submissions to date, the cities would agree that the areas highlighted by the AESO represent the issues of greatest disagreement.

Question 9:

Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.

As the cities noted in their November 20th response to question 2, it is first necessary for the AESO to provide clarification around what behaviours are beneficial to the system. Once it is understood which behaviours should be encouraged and which behaviours should be discouraged, the necessary price signal should become more obvious.

Question 10:

Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?

The cities have no comment on the AESO's proposed stakeholder process other than the say that it would be helpful if the AESO were to make available a fully developed proposed tariff with explicitly defined billing determinants and indicative pricing for those billing determinants before an application is filed.

Question 11:

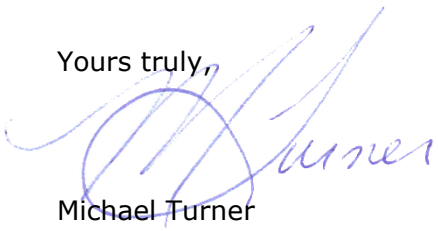
Do you have additional clarifying questions that need to be answered to support your understanding?

Question 12:

Additional comments

The cities undertook to provide helpful responses that supplement their November 20th submission, and have no additional comments or clarifying questions. We trust that these supplemental comments will be received in the constructive spirit that they are intended. Should any of our comments require further clarification, please feel free to contact me at (403) 781-7691.

Yours truly,



Michael Turner
President

cc: Jim Jorgensen, City of Red Deer
Stew Purkis, City of Lethbridge

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Blair Wood
Comments From:	Conoco Phillips Canada			**Phone:**	403 532 3575
Date:	2021/01/12			**Email**:	Blair.wood@conocophillips.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable and Conoco appreciates the AESO's consultation work on the tariff. The AESO reviewed many tariff concepts in the session, it would have been helpful to outline the process the AESO will use going forward on reaching its recommended tariff design.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	Conoco views the embedded cost allocation approach to be most appropriate. Alberta has recently greatly expanded its bulk transmission system. The marginal cost allocation approach will therefore likely lead to a very low level of cost for an additional MW of new load. Therefore, the marginal cost is likely small, and we are left with allocating based upon an embedded approach for most of the cost. Bulk transmission comes in large blocks and therefore a marginal cost approach is likely not useful.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	Conoco supports a mitigation approach that does not extend for a significant period. Conoco recognizes that a change in rates will impact some firms significantly. However, to be fair to all ratepayers, tariff adjustment should be made within a reasonable time period (i.e. <5 years). Conoco is open to a transition rate design, which may allow for the same rates to be charged to all ratepayers, while slowly reducing the dependence on 12 CP. The mitigation should allow firms that have sunk capital assuming the current CP design, to recover some these costs. The mitigation should not allow for ongoing subsidization of these market participants longer than a reasonable defined term.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Conoco agrees that price signals matter. However, the price signals and resulting behaviour must make economic sense overall for Alberta ratepayers. If a price signal transfers costs from one customer group to another, then the price signal must also add more value to all ratepayers that it costs.
		
		Cost responsibility- Conoco agrees that generation additions also drive transmission costs in addition to load growth. Therefore, any tariff design must recognize responsibility to pay the cost of these additions from load only customers.
		
		The use of the grid is evolving with more generation being constructed and some generation added closer to the end use customers. The rate design must take into account the economics presented to participants inherent in the transmission rate design.
		
		The largest problem from a transmission perspective facing all Alberta load customers' is the very high cost of transmission. Therefore, Conoco agrees that given this high cost, tariff design is extremely important. To give correct economic signals to load customers, a new rate design is required. Conoco agrees that some mitigation of rate increases, caused by the transition to a new rate design, should be mitigated. However, Conoco reiterates that this mitigation should have a reasonable term. The AESO may want to explore ways of allowing price responsive loads to add value for all ratepayers by designing further opportunities such as expanding LSSi or looking at non-wires alternatives from loads to defer further regional transmission expansion.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Conoco recognizes there are areas of disagreement in the tariff design discussions.
		
		Conoco believes that the current CP design is not efficient since it has created a significant response to very little benefit to all load customers. While this load response to CP may impact pool price in the hour of response, the value of the load response to pool price could be significantly greater if these price responsive loads focused solely on the pool price as opposed to the CP charge.
		
		While the load response has likely impacted the peak demand in the Province, there is no evidence that this response has deferred or eliminated transmission capital costs. The AESO has previously forecasted significant load growth, which lead to a significant expansion of the transmission grid. It is not clear that the AESO's load forecast was impacted at all by the response to 12 CP.
		
		Ideally, a rate design is based upon the principle of cost causation. However, where clear responsibility for a cost is unclear, such as the bulk costs, then other rate design principles must be relied upon. In these cases, cost responsibity and fairness must be considered. Any amount of load behavior cannot reduce transmission costs that have already been sunk.
		
		It is reasonable for the AESO to consider all of the policy initiatives currently underway as context for any rate design changes, including the Governments discussion on self-supply and export. However, this consultation on Bulk and Regional charges has gone on for over 3 years. It is now important for the AESO to apply to the Commission for a proposed rate design and for the Commission to clarify the future rate design in Alberta. Further delay in a rate design will impact customer cost analysis and lead to delays in capital spending a decline in economic growth.
		
		Conoco views that any rate mitigation should be temporary. If a customer cannot function under the new design then the Customer can apply for a load specific rate with the Commission.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	Conoco is in agreement with most of the AESO's considerations. Conoco awaits the AESO's specific rate design proposal.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Conoco is aligned with the areas of agreement on energy storage.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	Conoco has the following opinions on areas of disagreement on energy storage. Energy storage is a user of the grid for activities such as arbitrage, but if relied upon for transmission services, then storage could be a component of the grid. Storage should be viewed like other types of opportunity services, such as export and DOS. Storage should also pay STS costs. In that way, storage should pay for inflows and outflows like every other network user. As stated in Commission decision 2007-106 when discussing opportunity rates: • "P86 "The Board considers that opportunity service should be priced at no less than incremental variable cost of providing the opportunity service, and that opportunity service rates should also reflect the value of the opportunity service to the customer. " Therefore, the AESO should consider storage pricing at levels higher than the administration costs of providing the rate, but lower than value of service to storage (in order to attract storage to the grid).

9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	The AESO should view energy storage as an opportunity rate. Then the AESO should use the principles and calculations used in determining the export and DOS rates in creating a reasonable storage tariff. The AESO must understand the cost of storage and its value in order to design a rate that will create value for Alberta consumers.
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	The AESO should clarify its process for determining the appropriate rate design for Bulk and Regional rates.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	
12	Additional comments	Thank you for the opportunity of providing our input.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Rick Cowburn
Comments From:	Canada West Ski Areas Association	**Phone:**	(403) 397-8785
Date:	Jan. 12, 2021	**Email**:	rcowburn@vidya.ca

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	"On September 14, 2017, the AESO filed an application for approval of its 2018 ISO tariff application." We have now been at this for over three years. Everyone has said what they have to say, and the AESO has heard it all. All that is left is for the AESO to file the application, and for the Commission to rule.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	Marginal cost makes sense in a generation context, when considering the cost of adding additional peaking capacity; the capacity market exercise explored this at great length. Marginal cost makes no sense in a transmission context. "What is the marginal cost of a piece of string?" No generic answer is possible – it depends on the specifics of the situation. For good reason, Alberta has never implemented a marginal cost based rate. Let us not expend resources on a vague, undefined concept that can only lead to endless debate and dispute.

3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not?
	b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify.
	c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?
		This is surely the most difficult issue facing this tariff application.
		In this stressed economic situation, it is essential that transmission tariff changes not have a material adverse impact on any party.
		However a continuation of the current 12CP methodology would have widespread adverse impacts as some customers take advantage of the opportunity to shift costs onto others.
		There are at least three broad approaches to mitigation:
		• **Grandfathered cost-transfers**: Analyze past cost transfers achieved by individual customers & grandfather past levels of 12-CP response.
		  ○ Grandfathering is administratively complex & arguably unfair. (Note AUC's abandonment of grandfathering re substation fractions in ID 25848, see also https://ablawg.ca/2019/12/02/further-thoughts-on-the-law-and-practice-of-grandparenting/)
		  ○ However a backward-looking approach could demonstrably shield customers from disruption; a similar approach was implemented through deferral accounts in 2001 by the GOA to deal with the price explosion at retail market opening. This is perhaps the next best alternative after Rate Design.
		• **Rate design:** A rate design phase in would unfortunately continue the 12-CP cost-shifting incentives for some period of time at some reduced level. However this appears to be the most practically workable alternative. This need only apply to bulk charges, which could be divided into two pools, one pool recovered through the current 12CP method, one through another method (for example NCP). There are two billing determinants and two rates for bulk charges, and it's done.
		• Rate 'tinkering' through contract or ratchet changes seems unduly complex and unlikely to achieve balanced results.
		• **Bill adjustment:** This is just another way of looking at the rate design option. Consumption will change from month to month, and the resulting bill must change as a result. To calculate bill impacts one needs an 'old rate' and a 'new rate', whose difference can then be dealt with. This creates more billing and administrative complexity, with no obvious benefits compared to simply creating two bulk rate designs.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Efficient price signals: The AESO's planning documents demonstrate that generation additions, dispatch and line outages will be the primary drivers of most transmission system expansion. There is little point in implementing broad-based price signals for load at this time. Better to wait for the promised review of the T Reg, and see what emerges.
		
		Cost responsibility: User pay is the core concept of ratemaking, with usage being measured in various ways.
		
		In practice, no attention is paid to the historic drivers of facilities expansion, nor is that practical. The major exception is of course the Big Build, particularly CTI facilities, which were put in place as a matter of public policy and hence are a cost responsibility for all Albertans.
		
		Moving to an unratcheted NCP allocator & billing determinant would be one reasonable way of ensuring that all users contribute when they use the bulk system; retaining the regional charge's two year ratchet ensures that occasional or 'humalong' cogen users make a fair contribution, retaining many of the flexibility benefits of the current 12-CP approach while mitigating its cost-shifting potential.
		
		Minimal disruption: Given the chaos created by COVID-19, minimizing disruption due to tariff changes deserves the highest priority. We need to stop the 12-CP created bleeding of costs between customers, while mitigating the impacts of phasing out this cost shifting – and that's it. Customers need certainty as to future transmission charges, not creative constructs designed to benefit their proponents.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Efficient Price Signals: Truly efficient price signals should be targeted at new generation, not load. The money has now been spent, and what remains is a predictable squabble over who should pay, dressed up in fancy concepts like "economic efficiency" and "marginal pricing" to obscure the fundamental self-interest driving some proposals.
		
		Rather than seeking to create new 'winners' and 'losers', it is reasonable to accept the status quo for the moment and await further policy developments, particularly in this difficult economic situation.
		
		Cost Responsibility: Is a province-wide matter. The bulk of the bulk system costs were caused by provincial policy decisions, particularly CTI. Under the current legislation, generation pays essentially nothing for transmission, even though generation location is the fundamental driver of all transmission costs. Load-focused discussions of cost responsibility appear to be primarily driven by a desire to shift costs elsewhere, not by physical and legislative realities.
		
		Minimal Disruption: Now is not the time for change, other than to stop the bleeding.
		
		Permanent rate mitigation is impossible - all things must pass, and the Commission cannot permanently fetter its discretion. Permanent rate mitigation is just a way of avoiding the difficult decision as to how mitigation might be phased out. Certainty as to phase-out timing would be helpful to customers who need to plan their future activities.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	There is an unbridgeable gap between those who benefit from 12-CP and those who are paying higher costs as a result. Three years of discussion have only served to harden positions. The Commission will have to decide; the industry cannot.
7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?	No comment
8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not?	No comment

9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	No comment
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	The AESO's open stakeholder engagement process and the diligent work of AESO staff is much appreciated. This has been a long and difficult journey with a fractious band. We await the AESO's application, which will be controversial no matter what.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	To assess mitigation options, a POD-level database of monthly billing data is essential, as was suggested in CWSAA's earlier submission. All that would be required for status-quo based bulk tariff analysis would be each POD's monthly 12-CP demand and NCP demand, along with some corroborating data.
12	Additional comments	Addition of precisely targeted transmission rates options would be useful, where possible within the legislation's straightjacket. Locally targeted behaviours such as interruptible load or generation schemes may be of benefit, provided that they meet specific local needs and result in demonstrable deferral savings (which will be rare). Broadly available options such as interruptible rates would however just recreate the familiar scenario of customers jumping onto the rate when risk of interruption is low, and migrating off of it when interruptions become necessary (recall Class III interruptibles from the 1980's). A focused discussion of reasonable rates options might be useful, as parties might then be less inclined to 'talk their book' and more open to pursuing options in the broad public interest.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Christine Runge (Power Advisory)
Comments From:	DCG Consortium The DCG Consortium is comprised of the following members: BluEarth Renewables Inc., Canadian Solar Solutions Inc., Elemental Energy Renewables Inc., Irricana Power Generation, RWE Renewables Canad Holding Inc. and Siemens Energy Canada Limited. This submission represents the consensus view of the group and is submitted on behalf the group by Power Advisory LLC.	**Phone:**	403-613-7624
		Email:	crunge@poweradvisoryllc.com
Date:	2021-01-12		

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
	Initial Comment	The DCG Consortium has participated in this consultation based on the impact changes to the bulk and regional rates will have on DCG Credits. The Commission has recently initiated the DCG Credit Module for Fortis' Phase II Distribution Tariff Application (Proceeding 26090) which will consider whether DCG Credits should continue to be included in a distribution utility's tariff. Until the resolution of that proceeding, the DCG Consortium will continue to participate in this consultation on the assumption that there will continue to be a relationship between the DCG Credits and the bulk and regional rates. The DCG Consortium continues to be of the view that this consultation should be put on hold until a review of the *Transmission Regulation* takes place and resolution is achieved on a number of ongoing regulatory proceedings, including but not limited to the Distribution System Inquiry (Proceeding 24116) and Proceeding 26090 (collectively, the "Ongoing Matters").
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	

3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	The preference of the DCG Consortium was expressed in its comments to Session 3. Those comments are repeated here for ease of review: "Further, in the event that the AESO is filing for changes to its bulk and regional tariff design in 2021, the DCG Consortium supports the use of a grandfathering mechanism that protects investments that have been made in response to the existing tariff design. This would include grandfathering of both load customers as well as DCGs that have responded to the DCG Credits. If a grandfathering mechanism is considered to be overly complex, a transitional mechanism would be an acceptable substitute." "A grandfathering approach is preferable to a transitional mechanism as it allows companies that have made substantial investments in response to the existing tariff to earn a return on those investments whereas a transitional mechanism will limit the benefits available to those companies." This grandfathering approach allows existing DCGs to continue to operate under the regime under which these developers initially brought forward their generation projects, which is both just and reasonable. These comments reflect the DCG Consortium's preference for a permanent grandfathering of past rates for existing customers that have made substantial capital investments in response to the current tariff signals. This was not one of the AESO's five proposed mitigation options outlined on slide 56. Of the AESO's five options, the DCG Consortium prefers either the permanent bill reduction approach, described as "Bill increase of no more than X%" or the "phase in tariff charges" approach from AESO slide 56. Applied to DCGs, the permanent bill reduction would prevent DCG Credits from decreasing by more than X% permanently. In order to provide fully informed feedback on this approach, the DCG Consortium needs to understand the AESO's expectation of the magnitude of "X". The DCG Consortium suggests a low level of X that sufficiently prevents material disruptions to investments. Similarly, when discussing the phase in of tariff charges, the DCG Consortium needs to understand over how many years the AESO is considering this phase in. The DCG Consortium suggests a phase in term that is sufficiently long to prevent material disruptions to investments. Overall, DCGs are currently facing a significant level of uncertainty regarding the DCG Credits given the initiation of Proceeding 26090 and this consultation. The uncertainty as a result of the Ongoing Matters represent potential material changes to DCG Credits which increase investor risk and impairs future investment in the Alberta electricity market.

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		The DCG Consortium agrees with the statements included on the areas of agreement slide from the presentation.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Efficient Price Signals
		
		The AESO has not indicated how much the response to the 12CP tariff signal has reduced the costs of the transmission system over the past two decades. While we do not know the magnitude of the value, we do know that the response to that price signal – by price responsive load, self-suppliers, energy efficiency, and DCGs – has flattened Alberta's overall load shape. This flattened load shape should have reduced the need for new transmission infrastructure over the past decade resulting in material cost savings to load customers in Alberta.
		
		Tariff price signals should be forward looking, *i.e.* the rates should be designed to incent desirable behavior in the future. This requires the creation of variable rates wherein response to those rates results in cost savings to the end use customer. The 12CP rate fits into this category. If it has been determined that the behaviour incented by the 12CP charge is no longer desirable, the AESO should determine the desirable future behaviour and set variable rates to incent that behaviour.
		
		The AESO should design its tariff rates with a focus on incenting desirable behaviour for future development, rather than changes to rates that punish decisions already made by investors (including both loads investing in load reduction or onsite generation and DCGs).
		
		Cost Responsibility
		
		Cost responsibility is difficult to reflect in rates without changes to the *Transmission Regulation*. Alberta has a transmission policy wherein load pays for the delivery charges, regardless of the original need for transmission development, in order to facilitate a competitive energy market and transparency regarding delivery charges vs. energy charges. Under this policy, the transmission tariff should be more heavily focused on efficient price signals as compared to cost responsibility. The rates should incent desirable behaviour where possible and accept the constraints of the existing *Transmission Regulation*.
		
		Minimal disruption
		
		The DCG Consortium commented on this point in its previous comment matrix where it stated:
		
		"The DCG Consortium strongly agrees with Proposal 1 that this is not the appropriate time to engage in a major tariff redesign. To foster investor certainty, when and if any change is made to the bulk and regional rates, the new rate structure should be maintained in that form for 10+ years prior to being revisited again. This is extremely unlikely to be the case if the tariff

		is redesigned in advance of a review of the *Transmission Regulation* and resolution on a number of ongoing regulatory proceedings, including but not limited to the Distribution System Inquiry (Proceeding 24116) and the DCG Credit module for Fortis' Phase II application (Proceeding 26090) (collectively, the "Ongoing Matters")." "The DCG Consortium prefers Proposal 1. While the status quo may not be the best outcome in the long run, maintaining the status quo until the Ongoing Matters are resolved is the only responsible path forward. Investor certainty and regulatory efficiency require that we do not waste time debating a new tariff structure only to have it changed again quickly thereafter. Further, given regulatory lag (the AESO has noted that this tariff may be in place by January 1, 2023), this tariff design may never be fully put into place if a new *Transmission Regulation* comes into place part way through the regulatory process. The current *Transmission Regulation* is set to expire at the end of 2021." From a regulatory efficiency perspective, it would be desirable for Proceeding 26090 to be concluded prior to continuing with this consultation. However, until that proceeding is concluded, DCGs need to continue to participate in this consulstation under the assumption that there may continue to be a link between these the bulk and regional rates and DCG Credits. Further, and as previously noted, in the bigger picture, this consultation should be put on hold under the government reopens and reviews the *Transmission Regulation*.
6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	The DCG Consortium supports the release of a bill impacts tool prior to the final AESO session. The DCG Consortium continues to suggest this consultation be put on hold until the resolution of some or all of the Ongoing Matters.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	(1) It is difficult to determine if there is a concern with the use of marginal rates without understanding the magnitude of those marginal rates. Please provide approximate example rates for this rate design similar to what was done previously (*i.e.* the AESO provided a workbook suggesting the regional 120CP would be set at approximately $1,000/MW x 120 hours a year.) (2) As noted in response to question 3, in order to provide informed comments on the various mitigation proposals outlined on AESO slide 56, the AESO must provide values in place of the Xs. Specifically, the DCG Consortium is interested to know the number of years over which the AESO is considering a tariff phase in and the percentage of permanent bill reduction.
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Dale Hildebrand
Comments From:	Dual Use Customers			**Phone:**	403-869-6200
Date:	2021/01/12			**Email**:	dale.hildebrand@desiderataenergy.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	At this stage of the engagement the information provided is still very high level without any analysis and study (e.g., cost of service study) to support the AESO's proposals.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	The embedded costs cannot be ignored. Cost causation and rate design must consider what created the costs in the first place. A marginal cost approach is appropriate for incremental costs, not embedded costs. Tariff price signals need to address both embedded and incremental costs.

3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	The significant increase in transmission bulk system investment is a combination government policy (e.g., *Transmission Regulation* requiring congestion free system), government fiat (e.g., Bill 50 directing critical transmission investment) and poor transmission planning decisions (e.g., SATR building transmission to serve wind generation that has not materialized). These transmission system costs were not caused by or built for price responsive customers or cogenerators. Therefore, rate mitigation measures need to be permanent to price responsive and cogenerators customers impacted by large rate increases. The rate mitigation measures should be commensurate with the level of rate shock imposed. If the proposed rate increase amount to severe rate shock (e.g., a rate increase to any one customer greater than 20% more than the average rate increase to all customers in aggregate) then 12 CP should be retained for existing customers. The DUC discourages utility tariffs that differentiate between existing and new customers. So called "grandfathering" creates administrative issues that are exacerbated over time and can be patently unfair to either existing or new customers. In our view, grandfathering has no place in Alberta's competitive electricity markets. However, faced with severe rate shock, grandfathering may be a requirement. Perhaps an appropriate mitigation option to severe rate shock would be for the AESO to develop two DTS type rates – one that applies to existing customers (12 CP for mitigation) and one for new customers (with a new AUC approved rate design). Large rate increases (severe rate shock) should not be rolled in over time; rate mitigation needs to be sustainable and permanent. We note the following from the AESO's January 4, 2021 Stakeholder Newsletter: > The AESO recognizes that the concept of bookends, shared at our Sept. 24, 2020 session, and associated rate impacts has created much angst and concern among certain stakeholders. We want to take this opportunity to clarify that it has never been the AESO's intent to move forward with a one-time +100 or +130 per cent rate increase to broad groups of customers in our bulk and regional rate design development. While this clarification is welcome, revised tariff designs that result in severe rate shock will need to be justified based on sound cost of service study results and industry standard rate design principles. To date, we have not been provided with proper justification for the rate increases proposed by the AESO. If large rate

		increases are found to be justified, then permanent rate mitigation (i.e., 12 CP) is required for those customers faced with severe rate shock.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Efficient Price Signals:
		
		12 CP provides a very strong price signal that we continue to believe is appropriate for future tariffs. All of the other tariff proposals will have a weaker price signal that will lead to increased transmission investments over time and higher power pool prices (as price responsive loads will be less motivated to reduce demand during times of the system coincident peak).
		
		Cost Responsibility:
		
		The major transmission build was intended to provide congestion free transmission primarily for renewable generation, increased reliability and provisions for future load growth - these reasons lead to firm loads being cost responsible. The major transmission build was not driven by price responsive loads or cogenerators, yet the AESO believes these customers should be subject to astronomical rate increases.
		
		Until the Transmission Regulation is revised, load pays for transmission wires costs, regardless of why the costs were incurred.
		
		Minimal Disruption
		
		As noted above, there should be mitigation for existing customers who will be subject to severe rate shock. A fair and appropriate mitigation option to severe rate shock is for the AESO to develop two DTS type rates – one that applies to existing customers (12 CP for mitigation) and one for new customers. However, the DUC remains concerned that any new tariff design that discourages new load from connecting to the Alberta grid will not help lower transmission tariff rates over time.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Efficient Price Signals:
		
		DUC submits that 12 CP price signals are efficient and forward looking.
		
		Cost Responsibility
		
		Both cost causation and cost responsibility should be utilized for rate design.
		
		DUC disagrees that 12 CP has not influenced transmission costs - in the absence of 12 CP transmission investments could have been even higher.
		
		Transmission investments have been driven by factors in addition to peak loads – this does not negate the reasons why 12 CP continues to be the appropriate rate design for Alberta in the future.
		
		Minimal Disruption
		
		The DUC does not understand how a rate design change will “stop the bleeding”. Shifting costs from one group of transmission customers to another will do nothing to reduce past or future transmission investments. Alberta electricity consumers need new load to help pay for the transmission that has been built – the AESO’s proposed tariffs will result in load reductions and discourage new investment that could lead to load growth.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	Until the Alberta government provides clear policy direction that a transmission rate design change is required the AESO should not be proposing radical tariff changes that will financially impact the province (jobs, taxes, economic growth and prosperity, etc.).

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		The AESO should start from the premise that load pays for all transmission costs except losses. If for example, energy storage can provide competitive ancillary services, then the AESO should find innovative ways to procure these services. To the extent energy storage competes with other generators for the provision of electricity, the DUC echoes IPPCA's perspectives:
		• Energy storage-related transmission costs should be based on cost causation.
		• Treatment of energy storage projects needs to be fair to other entities, and consistent, in order to provide certainty and stability for potential investors.
		• The AESO should consider modelling and reporting on energy storage projects in Alberta, including metrics to evaluate their use of the transmission system. This reporting should be made publicly available.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	See 7 above. Concessions for energy storage may be appropriate for the provision of lower cost ancillary services. The AESO has provided special provisions for different types of generations to accommodate their unique attributes, for example, the lack of wind dispatchability.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Energy storage should be enabled in a manner that provides value to Alberta electricity consumers**.**

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Rate mitigation is critical for Alberta at this juncture and should be determined before any further tariff development is pursued.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	The DUC continues to not understand the AESO's rational for pursuing the proposed rate design at this time, and in the absence of an industry standard cost of service study.
12	Additional comments	If the proposed tariff changes are politically driven, then please make public the Alberta government's policy directives.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	EDF Renewables Development Inc.
Comments From:	CanREA			**Phone:**	416-557-9155
Date:	2020/01/12			**Email**:	David.Thornton@edf-re.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	It is important that the AESO pursue mitigation options that do not result in large stranded costs for market participants that relied on the price signal in the market. EDF believes that stability and a reliable investment framework is important for the long-term sustainability of the Alberta market.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Efficient Price Signals
		• There is value in price signals but the types of signals should be expanded in scope. Load attraction rates, for example, should be considered to locate new loads in areas that reduce transmission needs (such as high renewable generation areas)
		• Interruptible tariff also makes sense for those not using the system as firm power as long as the AESO accounts for the curtailable load in its planning.
		Minimal Disruption
		• Minimizing disruption will reduce the risk of stranded capital for those market participants that have already made investments based on the current tariff rate structure. This is applicable both to loads and generators (distribution connected in particular).

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Minimal Distruption
		• There is no immediate need to alter the tariff other than for the storage question. A delay to determine whether potential changes to the T-Reg would impact the end point is reasonable.
		• Mitigation does not need to be permanent but should be tied to the reasonable investment horizon, i.e. if an investment was made that has an expected life of 20 to 30 years, the mitigation should be for a similar timeframe (if it was made prior to the potential tariff changes being undertaken.)

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Energy storage is a unique technology. It should be treated in a FEOC manner, and this requires a storage tariff that does not distort real-time decision making for storage. EDF will provide further comments on specific storage tariff proposals but notes the key point is that storage can be utilized to improve market efficiency and reduce transmission requirements if the tariff sends appropriate signals.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	**Energy Storage as a User of the Grid or Component of the Grid** There may be storage facilities that are users of the grid or components of the grid or both. The key is that the tariff approach and the market rules support both uses without creating inefficient price signals in the real-time energy market nor discourage storage investment. **Payments for Inflows and Outflows** The key point is storage is generally not using electricity but rather changing the timing. Adds efficiency to the market). The price signal should not distort real-time decision making for storage optimization. For example, storage should not avoid charging in low energy priced hours simply because of tariff considerations unless there is an actual congestion concern with charging at that time.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	
11	Do you have additional clarifying questions that need to be answered to support your understanding?	
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Justin Rangooni
Comments From:	Energy Storage Canada			**Phone:**	647-627-1815
Date:	2021/01/12			**Email**:	jrangooni@energystoragecanada.org

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Energy Storage Canada (ESC) found Session 4 valuable for building a shared understanding of agreement and disagreement on future tariff design as the AESO intended.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	The status quo embedded cost approach divides the costs between a demand allocation and energy allocation based on minimum system needed to serve load (i.e., demand allocation) and the actual or optimal system (i.e., energy allocation). The marginal cost allocation approach is derived by determining the change in cost to serve one more customer/MW with next increment of capacity. A core issue the AESO has focused on is the rapid growth of network investments (see slide 47) over the past decade and the need to ensure sufficient funding is collected. While a focus on existing total costs is important in the near-term, that focus may not address the drivers for future network investments that could reduce the compounding of additional network investment costs. ESC supports a cost allocation approach to incentives consumption behavior that maximizes the use of existing network investments and decreases the potential for future network investments. At this time, it is not clear to ESC whether an embedded or marginal cost allocation approach is better suited to address the challenge of maximizing existing investments and minimizing future investments.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here? Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	ESC supports interruptible/standby rates as mitigation options in rate design. Rate design that provides both adequate cost recovery and increased optimization of network investments is an appropriate path forward. Interruptible/standby rates can recover a portion of total costs while providing a signal for consumption that avoids future costs in the system due to constraints.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Yes, ESC believes generally the AESO has captured areas of disagreement as presented in Session 4.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behavior has not influenced those costs?
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Yes, ESC believes generally the AESO has captured areas of disagreement as presented in Session 4.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	The AESO states that total costs are not changing; however, there are a number of potential transmission network investments under consideration. It would be beneficial for the AESO to describe the future system development expected and how much total costs may change over the next decade as a new tariff design might be implemented. This would provide guidance on the difference between cost causality and cost responsibility.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Yes, ESC supports the areas of agreement identified by the AESO in Session 4. ESC has consistently agreed with the AESO that energy storage is a unique asset that should be considered as so in tariff design.
		
		In addition to the list of participation in Alberta's electricity use-cases presented by the AESO, ESC notes that new market products are being developed that energy storage can offer (e.g., fast-frequency response)

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	In general, ESC is supportive of the areas of disagreement for energy storage presented in Session 4. The areas of disagreement accurately summarize the key topics that must be addressed in developing a unique energy storage participation type within the AESO tariff design. The attributes of energy storage are different that other network users (i.e., load and generators) and should be considered when developing energy storage tariffs. As discussed during Session 4, tariff treatment of energy storage as a transmission alternative must be considered carefully. As an efficiency tool for electricity systems, the value proposition of energy storage is different than other resources. If storage should pay charges for the transmission system, the value provided in avoiding future transmission investments and maximizing the use of the existing system should be appropriately attributed to storage.

9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	If energy storage is considered to be both a user of the grid and a component of the grid (e.g., storage as a transmission alternative), it would be beneficial for the AESO to describe how the value of using storage to avoid higher cost options (e.g., wires solutions) to meet electricity system needs is reflected in storage tariff design. Related, if storage is expected to pay for system charges (e.g., administration, O&M, POD, regional, bulk), it would help for storage entities to understand how the natural operation of energy storage assets (i.e., charge during unconstrained off-peak hours and discharge during constrained on-peak hours) will be considered by the AESO for cost allocation. Under the AESO's third option presented in Session 1, there would be a lower rate applied to storage under an interruptible service. As presented by ESC, administration and O&M costs are appropriate charges for energy storage to pay. What portion, if any, of POD/Regional/Bulk charges that should be included in the lower interruptible service rate for storage is a key area of discussion. The portion should reflect the increase in utilization of the existing and future electricity system by the actions of energy storage.
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	None at this time.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	None at this time.
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Mark McGillivray
Comments From:	ENMAX Corporation			**Phone:**	
Date:	2021/01/12			**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	No comment.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	The vast majority of wires costs are fixed, so it will be extremely difficult (if not impossible) to find a marginal cost approach that produces a fair cost allocation across all transmission-system users. The use of marginal costs in the energy market makes sense because the resource mix and the associated costs can change materially as the load increases from (say) 8,000 MW to 11,000 MW. Said another way, the next megawatt consumed (or not consumed) can materially affect supply costs. However, since the transmission system is built to handle the 11,000 MW, there is no difference in fixed costs when demand is 11,000 MW compared to when it is only 8,000 MW; the next megawatt consumed (or not consumed) makes little to no difference. Consequently, a marginal cost allocation is very unlikely to meet the AESO's rate design objectives. As noted in our response to Question 5, a tariff design objective is to achieve a fair allocation of fixed costs.

3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	While ENMAX does not currently have a preferred option, we support a mitigation path with minimal disruption. The most appropriate mitigation path will depend on the rate design choice selected.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		See response to Question 5.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behavior has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		ENMAX recognizes that there is room for improvement in the current tariff design with respect to more efficient price signals and future cost allocation. However, in keeping with our previous comments submitted to the AESO, we support a path with minimal disruption and believe that major changes to the existing tariff design are premature at this time.
		
		Regarding cost responsibility, ENMAX is of the view that cost recovery must be based on the cost of providing each transmission service and an appropriate allocation of that cost across all customers.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	See response to question 5 and 10.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		ENMAX understands an energy storage facility to look like a generator when it is producing power and a load when it is absorbing power. It makes no difference to the physical transmission system whether power is flowing from a generator or an energy storage facility, and it also makes no difference whether power is flowing to a conventional load or an energy storage facility. Also, batteries are not the only possible energy storage facilities: pumped storage hydro, compressed air energy storage, and hydrogen production using wind energy are other examples. Technology agnosticism means that a tariff design must not favour one technology over another.
		
		ENMAX agrees that an energy storage facility can participate in Alberta's electricity use-cases by providing energy price arbitrage, operating reserves and non-wires solutions for transmission (and distribution) deferral.
		
		ENMAX agrees that energy storage should be treated in a FEOC manner. The preservation of a FEOC market in which no participant receives unearned advantages is a legislative requirement.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	Energy storage does not necessarily provide benefits to the grid in all cases. For instance, it may be considered a grid component if structured to charge/discharge at certain times for stability or reliability reasons, in which case it should be paid as would any provider of those services. However, if it is independently owned and operated, and participating in price arbitrage, then it is not a component of the grid and its compensation should be through that arbitrage. Either way, it is grid connected. Since all connected sources and sinks use the network, all should pay a fair share of transmission costs—including administration, operations, etc.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	See response to Question 10.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	The storage roadmap is still being worked on and there are a number of interrelated issues that remain outstanding, including the potential for changes to be made to the transmission policy and regulation. As such, ENMAX cautions against making major changes to the existing tariff design at this time. ENMAX trusts that the AESO will conduct a fulsome consultation with stakeholders prior to filing its application with the AUC and make adjustments to the timing of its application as needed.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	No comment.
12	Additional comments	No comment.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Gerald Zurek
Comments From:	EPCOR Distribution & Transmission Inc	**Phone:**	780-412-3243
Date:	2021/01/12	**Email**:	gzurek@epcor.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	EDTI found the session valuable.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	EDTI believes that an embedded cost allocation approach is appropriate as the majority of the AESO's costs, i.e. TFO rates, are developed using an embedded cost allocation approach.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	a) EDTI prefers the rate design mitigation approach as EDTI believes that this approach will be easier for DFOs to implement and easier for DFOs customers to understand. b) EDTI is not aware of any additional mitigation options. c) EDTI believes that the AESO's mitigation measures need to achieve an orderly transition to the new rates limiting the magnitude of the bill impacts with each change.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		EDTI generally supports the areas of agreement.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		EDTI generally supports the objectives of efficient price signals, cost responsibility and cost caustion and has an appreciation of the areas of disagreement. Further, EDTI believes that comprimises will be required to balance these sometime opposing objectives.
		
		Regarding minimal disruption EDTI believes that the AESO needs to more forward with changes to its tariff with mitigating measures.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	As noted in its response to question 5 EDTI believes the compromise will be required to achieve some aspect of the objectives of efficient price signals, cost responsibility and cost causation.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		EDTI is generally supportive of the areas of agreement. EDTI notes that energy storage may also participate in Alberta's electricity market as non-wires solutions on distribution systems.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	EDTI believes that storage should be treated as load when taking energy from the AIES and shold be treated as supply when delivering energy to the AIES.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Refer to EDTI's response to question 8.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	EDTI has no comments.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	EDTI has no questions.
12	Additional comments	EDTI has no additional comments.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Jordan Balaban
Comments From:	Greengate Power Corporation	**Phone:**	403 930 1300
Date:	2021/01/12	**Email**:	jordan@greengatepower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable in understanding the alternatives available and the AESO's assessment of the alternatives offered by participants.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	For the bulk cost allocation, Greengate views the existing embedded approach is the most reasonable. Alberta's system build has recently expanded substantially. If a marginal cost approach were used in such a bulk system with significant new and expanded capacity, the marginal cost of the next MW of capacity would likely be very low. This leaves an embedded approach as the more reasonable method to recover costs.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	New projects should face the new rates immediately after their implementation. Mitigation should be implemented to cover a short-term period, phased in if appropriate, and designed to account for some of the sunk capital that was invested assuming the current CP design. Mitigation should be designed to avoid an artificially induced "rush" to meet deadlines imposed by the mitigation.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Efficient Price Signals
		Greengate believes that price signals matter.
		Cost Responsibility
		Generation also cause wires development, and this should be recognized in the AESO's rate design for loads. The AESO should also design rates that recognize the unique value of storage.
		It is important that the next AESO tariff provide clarity to market participants after a lengthy examination of the bulk and regional tariff design. This should include a storage-specific rate that allows the system to plan for the value of current and future technology.
		Minimal Disruption
		Greengate believes that at this time, it is important to minimize disruptions and rate shock.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Efficient Price Signals
		
		Greengate acknowledges that disagreement exits over the efficiency of price signals with the Bulk charge. To be efficient the outcome of the pricing signal must create an appropriate response.
		
		Cost Responsibility
		
		Since much of the system costs have already been spent and the cost causation may not be clear, changes to rates must respond to other principles.
		
		Minimal Disruption
		
		Although policy uncertainty is a factor, rate changes cannot be delayed indefinitely. This is a source of uncertainty in itself, and can cascade into further policy uncertainty. After a period of three years on this bulk and regional process, it would be beneficial for market participants to understand how future rates will be structured.
		
		It is essential that a storage-specific rate be implemented in the next tariff application to create certainty for investors.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Greengate is supportive in all areas of agreement.
		
		Energy storage has unique characteristics that make it reasonable to implement a storage-specific rate in the next tariff. Like other participants, Greengate shares the concern that regulated transmission and distribution facility owners will be the main, and possibly only, investors in stand-alone storage if a unique tariff treatment isn't created. The AESO should allow a competitive market to grow for storage.
		
		Additionally, load, generation, and provincial interties receive differential tariff treatment to accommodate and receive the value of their unique requirements. The system and ratepayers should receive the greatest value for storage, which would accommodate an efficient rate for storage characteristics and would not restrict the competitive landscape for storage.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	Although there are some areas of slight disagreement, Greengate believes that there is enough agreement to move a forward in the next tariff with a storage-specific rate. When used for arbitrage, storage could be considered a user, while it is a component of the grid when used as a non-wires solution or other grid support. It is not reasonable, however, to put it in either category in considering how it should be treated in the AESO tariff. It is an existing, and evolving technology that offers great value to the grid, and a unique rate should accommodate these properties. Among other participants, Greengate believes it is reasonable to view storage similarly to other opportunity services like DOS and XOS. In order to attract storage to the grid, storage rates should exceed the administrative costs of providing service but remain lower than the value of service to storage. Storage should pay STS-related costs. With storage paying an opportunity rate for charging and the STS rate for discharging, storage would pay for inflows and outflows.

9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	The principles of the AESO's opportunity rates (DOS and XOR) should be applied to design a storage-specific rate. In Decision 2007-106, the Commission's view of these opportunity rates is useful in considering the appropriate charging rate: "The DOS rate has traditionally been priced in a manner to entice customers who would not otherwise be willing to pay the full DTS rate to use the transmission system for certain portions of their energy requirement. While it is a discounted rate, the DOS rate has been designed such that customers would not be enticed to use the DOS rate as a replacement rate for the DTS rate for their base load" […] The XOS rates were designed to recover all variable costs and also a contribution to fixed costs, to reduce the average level of rates charged to other customers. The resulting costs attributable to Rate XOS 1 Hour and to Rate XOS 1 Month were presented in the Application." Storage rate design principles should include that opportunity rates are partially designed to attract assets. The storage rate should recognize that storage should pay for some fixed and variable costs. This approach is necessary and appropriate because storage offers value to the grid that other assets cannot provide.
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Frequent check-ins with Market Participants is requested so that the AESO's proposed filings have the most appropriate level of stakeholder consultation.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Kurtis Glasier
Comments From:	Heartland Generation Ltd. (“Heartland Generation”)	**Phone:**	587-228-9617
Date:	[2021/01/12]	**Email**:	Kurtis.Glasier@heartlandgeneration.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Overall, Heartland Generation believes Session 4 was valuable and the AESO did a good job summarizing and characterizing the different rate design proposals. However, there is still little hard evidence to support a change in rate design; it seems that the AESO and stakeholders are only just establishing the theoretical framework with which to evaluate different tariff design options, without being given the opportunity to consider the evidence or analysis that would support one option or another. This is particularly problematic given that the AESO is proposing to present its preferred, final option at the next stakeholder session.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	Heartland Generation understands that both methodologies may theoretically meet the AESO's rate design objectives, but likely with varying degrees for each individual objective. For instance, the marginal approach may more fully meet the rate design objective of sending efficient price signals, whereas the embedded approach may achieve minimum rate disruption better as the regulator and stakeholders are more familiar with this approach. Rate design is often about tradeoffs, as the more efficient design may come at the cost of simplicity or minimal disruption.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	Heartland Generation finds it difficult to comment on mitigation options without first knowing the preferred rate design that the AESO is trying to accommodate. For instance, a mitigation approach that is trying to accommodate for a 100% or more bill increase will look very different than the approach to accommodate a much smaller bill increase. It seems presumptive to assume a significant bill impact, while the preferred rate design is not yet known to stakeholders. c) Any mitigation plan employed by the AESO should avoid rate shock and limit regulatory holdup, to the extent possible. Mitigation should be transitional, clearly outlined and appreciate the significant investment that many loads have made to react to the currently approved price signals. The AESO may also want to consider the addition of new rate classes as a proposed mitigation plan. For instance, a subset of DTS customers who are highly elastic and readily respond to the 12-CP signal may be eligible for a different class of treatment from the typical DTS customer.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Heartland Generation appreciates IPCAA's characterization provided in the Session 4 Summary: "We can all agree that we want Alberta to be an attractive place for investment and have a rate that works for the province. We need something that works for the long term and the bigger picture is a system that makes us a place that succeeds. Going forward, we need to look at the arguments more through that broader lens." The AESO needs to consider not just how we divide the current "pie", but how we achieve the right size of "pie" in the future.
		
		The socializing of transmission costs that could be deferred by behavior may only serve to increase the transmission cost burden in the future and lead to load behavior response that is much more severe (load growth reversal, participant exit). All participants want to ensure a fair and just rate design, which appreciates the diversity of needs and characteristics of all market participants.
		
		Finally, Heartland Generation does not agree that "Tariff charges are more *important* than ever before" and would clarify that due to their size they are only more "significant". Tariff charges and the correct behavioural signal they indicate have always been important and continue to be important to those parties that are able to react to the signals.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Heartland Generation does not take issue with the AESO's characterization of the areas of disagreement. It is worth noting that most of these areas of disagreement will need to be addressed by the AESO, either explicitly or inherently, in whichever preferred rate design is ultimately submitted to the Commission for approval. As such, the AESO should indicate their position on these areas of disagreement through this stakeholder engagement process.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	As stated above, the AESO should indicate its position regarding these areas of disagreement. This would include the analysis that the AESO's position relies upon in reaching these conclusions, and how that position aligns with the preferred rate design that it has selected.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Heartland Generation does not take issue with the AESO's characterization of areas of agreement for energy storage.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	Heartland Generation does not take issue with the AESO's characterization of areas of disagreement for energy storage.

9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Heartland Generation remains supportive of a rate class solution for energy storage, rather than an overall rate design solution. As energy storage acts as both a load and supplier of electric energy, it may be more appropriately handled as an opportunity service with the addition of a rate class similar to IOS/XOS. This could allow for energy storage, or other qualifying customers/facilities, to pay for costs directly related to the unique attributes of its facility and would not require overall bulk and regional tariff changes to accommodate. It is important to continue the characterization of energy storage as a market asset, rather than as a transmission asset, for the physical reality that energy storage must charge or discharge energy and this necessarily impacts the wholesale electricity market, to varying degrees.
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Session 5 will include the AESO presenting their preferred rate design, as such it would be helpful to receive these materials as much in advance as possible. The session in February has a lot of facets to be discussed, so having familiarity with the proposal prior will allow stakeholders to better participate in the session.

11	Do you have additional clarifying questions that need to be answered to support your understanding?	Generally, Heartland considers that the AESO's analysis to support a change from the status quo (12CP) raises more questions than it answers. Until recently, the AESO had indicated that the bulk system was built to serve peak load, and 12CP has been repeatedly approved on that basis; however, the AESO is now stating that "recent transmission projects are not only peak demand related" and that these projects were caused by "multiple different drivers." The AESO's support for its new-found position appears to stem from the correlation (or lack thereof) between coincident metered demand and network costs over the past decade, as shown on slide 47. However, much of the network investment over this period was in the form of Critical Transmission Infrastructure, which was mandated by the government. Does accounting for this considerable share of network costs influence the interpretation of this relationship? Furthermore, does the extent to which network expansion was driven by factors other than coincident metered demand impugn the AESO's planning? In other words, given that the AESO made it clear in the past that system peak does drive the need for bulk system expansion, does this lack of correlation indicate a failure in its planning, and not necessarily an underlying flaw in the tariff design? Heartland Generation, and likely other stakeholders, would appreciate the evidence that the AESO used to reach this conclusion and if the AESO could please identify which drivers do determine transmission planning and costs. Slide 49 provides rationale without supporting evidence; seeing the quantitative analysis regarding the alleged misalignment of the price signal from the future transmission cost savings would be helpful. Currently, the evidence mostly shows that customers are responding to the signal but has failed to adduce how this leads to an inefficient result, or why the transmission build signal differs from the load behaviour signal.
12	Additional comments	Heartland Generation does not have additional comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Vittoria Bellissimo
Comments From:	Industrial Power Consumers Association of Alberta (IPCAA)	**Phone:**	403 966 2700
Date:	2021/01/12	**Email**:	Vittoria.Bellissimo@IPCAA.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The December 10th session was not overly valuable to Alberta's industrial consumers. At this point, customers are confused as to why the AESO is redoing its tariff in this economic climate. Customers are also looking for actual proposals and a mechanism to evaluate the impacts of these actual proposals on their bills. IPCAA expects that the February 25th Session will be more valuable. IPCAA thanks the AESO for scheduling the March 2021 Technical Session to review the updated Bill Impact Tool. IPCAA encourages the AESO to limit the scope of this session and focus on customer needs and customer understanding of the Bill Impact Tool. It may be beneficial to run a separate session for Energy Storage. Load customers will have plenty of questions to fill this session. A review of the bill impacts of the mitigation options is expected at the March Technical Session. Please let us know in advance if this will not be provided.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	As the AESO indicates, the status quo classification between demand and energy charges is based on an embedded approach to cost allocation. At this point, there has not been a good case made as to why a departure from this approach is appropriate. IPCAA is concerned with a marginal/incremental approach in that it may exclude past investments from consideration in the future rate design. In order for rate design to be effective, it must remain in place for sufficient time to allow those who react to the price signals to capture value. Changing the rate design will impact customers who made good faith investments.

3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	a) IPCAA has significant concerns with the Bill Adjustment approach. It raises several questions: • How do you determine how much bill credit one customer should get versus other customers? • Which entity (AESO? AUC? DOE?) decides how much bill credit is appropriate for a customer? • What is the recourse for customers who feel they have not been dealt with fairly? • What information is required by the deciding entity and how is the evaluation conducted? Instead of grappling with these fairness issues, it would be more appropriate to develop a standby interruptible tariff that works for flexible customers and adds value to the system. b) Ramsey pricing should be considered as a rate design approach. c) The AESO needs to implement a system that does not force any customers out of business or out of the province. We need more load in Alberta, since we built a wires system for much more load than we currently have.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		IPCAA has no major concerns with most of these areas of agreement; however, the line: "Tariff charges are more important now than ever before" is questionable. First of all, the AESO is not taking any responsibility for the fact that transmission costs have risen at a rate that is not reflective of the underlying load growth on the system. Second of all, perhaps we missed a window for tariff changes before the big build, when some of the $17B of transmission infrastructure could have been avoided. Finally, IPCAA continues to object to the AESO's proposal to overhaul the tariff at this time, during a global pandemic, when there are many elements that have not been resolved that will ultimately impact the ISO tariff causing further revision, including:
		• The Transmission Regulation being re-examined by government by the end of 2021
		• Government changes related to self-supply and net-export expected in the spring of 2021
		• AUC changes resulting from the Distribution System Inquiry (such as aligning transmission and distribution rates). Further proceedings expected in 2021.
		• AUC changes to sub-station fraction and DCG credit issues need to be addressed.
		
		The AESO should work with both the DOE and AUC to resolve the issues impacting the tariff, prior to changing the tariff. The timing for a change is pre-mature. Customers do not want to see two major tariff overhauls in short order.
		
		As mentioned at the AESO session, IPCAA would support higher level areas of agreement being included in this list, such as:
		• We can all agree that we want Alberta to be an attractive place for investment and we need a rate that works for the province.
		• We need a rate design that works for the long-term and the bigger picture goal is an electricity system that makes Alberta successful.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		IPCAA agrees that there is no consensus amongst the AESO and stakeholders on these issues.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	If the AESO agreed that a tariff overhaul is premature, IPCAA could agree with: Minimal Disruption – now is not the time for a change.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		IPCAA has no major objections to these areas of agreement on energy storage. As stated previously, IPCAA provides the following high-level perspective:
		• Energy storage-related transmission costs should be based on cost causation.
		• Treatment of energy storage projects needs to be fair to other entities, and consistent, in order to provide certainty and stability for potential investors.
		• The AESO should consider modelling and reporting on energy storage projects in Alberta, including metrics to evaluate their use of the transmission system. This reporting should be made publicly available.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	IPCAA agrees that there is limited consensus amongst the AESO and stakeholders on these issues.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Energy storage should be enabled in a manner that provides value to Alberta consumers. This can be demonstrated with publicly available reporting.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Please see comments above on: • Question 1 – regarding the expectations of the March Technical Session; and • Question 4 – regarding how a tariff overhaul is premature at this time.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	Not at this time. IPCAA will likely have many clarification questions after the February 25th Session.
12	Additional comments	IPCAA recommends that the AESO consider the Alberta Direct Connect Consumer Association (ADC)'s rate design proposal, including Firm and Non-Firm Rates, and evaluate and report on this proposal.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Erika Goddard
Comments From:	Lionstooth Energy			**Phone:**	
Date:	2021/01/12			**Email**:	erika.goddard@lionstoothenergy.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	While the session was valuable, it is becoming increasingly apparent the AESO is proceeding with changes to B&R rate design, regardless of the areas where there remain material differences between stakeholders and the AESO, particularly the strongly expressed position by some that a change is not required and should not be pursued in today's economic environment. Any changes to B&R rate design must consider first and second order impacts. Load has responded to effective B&R price signals, as is evident in the relatively flat CMD over the years. It is important to note that it is not just increasing wires charges but also declining costs of on-site solutions, including energy efficiency and load management, that have driven investment, some of which would have occurred regardless of B&R rate design. Increasingly, the conversation has been shifting to those factors, other than load, that cause B&R wires growth (i.e., TCG, policy). A focus on "unwinding" the response to existing rate design by removing the link between load response and billing determinants, like CPD, is unlikely to resolve these concerns, and has the real potential to introduce new issues. The burden of proof is on the AESO. In order for further efficient and effective discussion, we must have quantitative studies, to justify the need for change,

		evaluate any rate design alternatives, and analyze both the impact and response from customers.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	No. It is our understanding that our market has historically used the embedded approach and so any change from using this approach would need to be supported quantitatively. To date, we do not believe this evidence has been provided. We note that the AESO has commented that rates under a marginal approach were not available at the time of Session #4. It is therefore premature to continue discussion on any alternative allocation approaches.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	We have a strong preference for a market where mitigation is not required. If mitigation is required, we prefer rate design mitigation options, specifically introduction of rate classes. Any mitigation options that include annual rate increases within an impact threshold or that would not come into effect until at least 2023, require careful consideration of the signal being sent to loads.

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
		We do not believe there is full support for these areas of agreement from all stakeholders. For example, there is strong support and agreement among a large group of attendees to maintain the status quo, an area of agreement not shown here.
		• **Efficient Price Signals:** Yes, price signals provide incentives for customer behaviour. However, tariff rate design signals only flow to Tx connected loads and DFOs. As such, these price signals are not effective on the other elements driving wires growth, nor is there alignment between Tx and Dx tariffs.
		• **Cost Responsibility:** We strongly disagree with the concept of cost responsibility or any concept that looks to assign cost based on value. The introduction of cost responsibility appears to be an unintended consequence

	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		of factors other than load driving wires system cost increases. Our market has long relied on cost causation.
		
		As our market evolves, we must consider the future vision for the integrated electric system, and pursue change across the broader perspective, not just focus on what could resolve immediate concerns without consideration of longer-term impacts.
		
		• **Minimal Disruption:** Further to our comments above, we agree with a path forward that is minimally disruptive, noting that consideration of the broader perspective may suggest that remaining with the status quo, until such time that other impactful issues may be progressed or resolved, would also be minimally disruptive.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		We do not believe there is full support for these areas of disagreement from all stakeholders.
		
		• **Efficient Price Signals:** In our view, there remains insufficient evidence to suggest a change from the status quo would be any better than any rate design alternatives.
		
		• **Cost Responsibility:** The primary mechanism for allocating costs should be based on cost causation.
		
		• **Minimal Disruption:** We agree, now is not the time for change, not only from an economic perspective, but also because the discussion to date has lacked sufficient quantitative analysis to justify the need for change, evaluate any rate design alternatives, and analyze both the impact and response from customers.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	Any rate design proposals must include sufficient quantitative analysis to justify the need for change, evaluate any rate design alternatives, and analyze both the impact and response from customers. An updated Cost of Service study remains outstanding. As it relates to the 2014 study, while Tx may be a long-term game, the evolving nature of our market, plus considerable changes in B&R tariffs over the past 7 years, suggests that an update, at a minimum, is required.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		We reiterate our previous comments on energy storage rate design – any tariff treatments that are afforded to energy storage would also need to be made available to other stakeholders that behave in a similar manner, including loads and generation.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	

9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	We must start to move from the theoretical to the analytical. Future discussion must include sufficient quantitative analysis to justify the need for change, evaluate any rate design alternatives, and analyze both the impact and response from customers. In doing so, it is inappropriate and premature to simply declare that maintaining the status quo is "off the table." To do so simply moves this inevitable discussion into subsequent regulatory proceedings, the cost of which is also borne by loads through regulatory cost recovery.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Horst Klinkenborg
Comments From:	Suncor Energy Marketing Inc.	**Phone:**	(403) 819-7125
Date:	2021/01/12	**Email**:	hklinkenborg@suncor.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Suncor considered the session valuable. Two things could have made the consultation more productive: 1) While the discussions get more and more detailed, very fundamental issues have not been resolved. The case for change is still not clear. Some parties argued that the current 12-CP methodology is inefficient; however, there has been no analysis of marginal costs of individual billing determinants, which would be required to incorporate efficiency in the tariff. Other parties have argued that because the industry is changing, cost allocation also needs to change. However, this perspective also has not been supported through any kind of analysis that would show why other allocation measures would somehow be "better" – statements of personal preference do not qualify in Suncor's view. 2) There has been no synergy in discussing the treatment of storage at the same time. Suncor submits that it would beneficial to hold that discussion until a base rate proposal for DTS has been developed. Afterwards, development of alternative rate classes in general and the treatment of storage in particular should be discussed.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	Suncor submits that in light of the overarching efficiency objective in the *EUA*, the tariff design should fundamentally be based on a marginal cost perspective with any deviation needing careful consideration and appropriate justification. Given the requirement to recover all costs, remaining costs should be recovered in a fashion that does not interfere with the efficiency objective.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	a) Suncor is not sufficiently aware of arguments for each of the options to have a preference. b) No c) One of the goals needs to be to avoid inefficient new investment. Further, sunk investment should not unnecessarily be stranded. Finally, the design should not create inappropriate barriers for new demand or inappropriately destroy existing demand.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Efficient Price Signals
		Suncor is not convinced that this is an area of agreement. While the current design is being critiqued as being inefficient, most proposals do not consider or include efficient price signals.
		Cost Responsibility
		Cost responsibility is in Suncor's view too vague a term. Instead, the focus should be on cost causation, *i.e.* efficiency.
		There has been a lengthy debate around 15 years ago on who should pay for transmission and why. Suncor does not believe a, on its surface simple, statement that "more than just load behavior drives transmission development" can sufficiently captures the necessary nuances.
		Suncor believes there was agreement that the system and consequently transmission need is evolving.
		Minimal Disruption
		Suncor believes there was indeed agreement on the items listed on the left.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Efficient Price Signals
		
		Suncor submits that there has been no analysis showing that current price signal, which were approved as reflecting cost-causation, are inefficient. Suncor considers the supposed impact of tariff signals on energy costs to be an irrelevant consideration.
		
		Price signals should always be considered forward looking because price signals inevitably impact future behavior. Price signals are efficient when individual incentives align with societal benefits.
		
		Cost Responsibility
		
		Cost responsibility is in Suncor's view too vague a term. Instead, the focus should be on cost causation, *i.e.* efficiency.
		
		Suncor is not aware of any analysis that shows to what extent, if any, the current price signal deviates from the efficient marginal cost signal. Suncor believes that there is no evidence that load behavior has not influenced transmission costs.
		
		Minimal Disruption
		
		Suncor believes that given the current overall situation, any case for change needs to be extra carefully evaluated. To date, Suncor has not seen any compelling evidence that a change to the tariff structure is required with any amount of urgency.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	Any rate design proposal should make a clear case for the need for change and then show why the new proposal is *better* than the existing design. Because fundamental issues haven't been resolved, it is difficult, if not impossible to discuss agreement/disagreement on solutions.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		• In Suncor's view, the *unique nature* of energy storage is irrelevant for the tariff discussion.
		• Suncor takes no position on how energy storage can or should be part of the electricity industry. However, for the tariff discussion, it is important to focus only on the role of energy storage as a market participant and on the type of system access service provided to them.
		• Suncor supports the treatment of all market participants in a FEOC manner.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	• The only relevant issue from a tariff perspective is the system access service energy storage receives as a market participant. • Any other use/service/etc. is irrelevant for the tariff discussion. • Energy storage should pay the rates appropriate for the system access service they receive based on their billing determinants. • While storage might prefer to receive different or lesser service, this would be appropriately addressed through new rate classes that are available to all customers; not by creating some exceptions or special charges for energy storage.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Suncor submits that FEOC treatment requires that all customers, including energy storage, pay the rates for the services they receive, regardless of whether these customers would prefer a different service. However, Suncor is supportive of investigating the creation of new rate classes as it has been requested by some market participants for quite some time.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Suncor submits that it is of upmost importance to ground this consulation. In its current state, the consultation is effectively a back and forth between rate design preferences without any serious considerations of rate design principles and without any supporting analysis (quantitative or qualitative) one way or another. Suncor does not believe that there is any chance for agreement under the current process.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	
12	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Akira Yamamoto
Comments From:	TransAlta Corporation			**Phone:**	403-267-7304
Date:	2021/01/12			**Email**:	akira_yamamoto@transalta.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, Session 4 was valuable. It provided a good opportunity to review and discuss the proposals made in the previous session. ***Energy storage should be separate out at its own tariff initiative*** We find the scope of the meetings to be mixed and confusing with discussions at a higher level, bulk and regional tariff design, and then at a more granular level, energy storage treatment. We view the differences in these consultations to be significant and the consultation on energy storage has suffered (with less progress) due to its relative (smaller) significance compared to bulk and regional tariff design. As suggested in our previous comments, we recommend that the AESO separate the consultation on energy storage from the bulk and regional tariff design.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	TransAlta provides the following assessment of the current embedded cost and a marginal cost allocation approach following the five design objectives selected by the AESO. We note that both approaches must fully recover all embedded costs under the cost of service legislative framework as such the assumption is that even if a "marginal cost allocation approach" were applied any shortfall or surplus between embedded and marginal costs would ultimately be recovered/refunded to customers.

		(1) Reflect Cost Responsibility The embedded cost and marginal cost allocation approaches rank similarly in reflecting cost responsibility because both approaches must ultimately provide for the recovery of embedded costs under cost of service regulation. Neither approach truly measures or attempts to allocate costs based on the "benefit and value transmission customers receive from the existing grid" (they allocate effectively deemed a value of transmission benefit that is established by the actual cost of the system). That said, it is more likely that a marginal cost approach that allocates costs based on incremental cost and not on the cost of the existing grid could deviate more from achieving this design objective. We would further note that the embedded costs of overbuilt transmission (built well in advance of need) can create significant dislocations between the cost and benefit/value. In other words, excess transmission beyond the needs of customers does not translate to higher benefit or value for customers. (2) Efficient Price Signals To the extent that the embedded and marginal cost approaches reflect different values by billing determinant, the marginal cost approach is likely to provide a more representative price signal in that it would attempt to quantify the expected future cost for an increment of the selected billing determinant. The embedded cost approach is historical/backward looking and, where future build/cost are expected to deviate significantly from the past, could provide inefficient price signals that under or over-estimate future costs. The AESO's definition of an efficient price signal is a "Price signal to alter behavior to avoid future transmission build". If this definition is accepted, then the greater the costs that are allocated through a billing determinant that a customer can respond to would be an efficient price signal. In other words, a $10,000/MW/month charge is a stronger signal than a $3,000/MW/month charge and would likely incent a stronger customer behavioural response. (3) Minimal Disruption Obviously, maintaining the existing embedded cost approach is likely to be the least disruptive for customers that have responded to the 12 CP price signal and invested to reduce transmission costs. The marginal cost approach may be more disruptive because it is applying a different approach than the current embedded cost approach. However, a

		change from the current embedded cost approach to new/different embedded cost approach may be equally or more disruptive (for example, allocating more costs using a billing determinant that is not 12 CP based). (4) <u>Simplicity</u> The marginal cost approach would involve introducing the complexity of calculating the marginal cost of transmission. This would be a departure from the current approach which does not rely on calculating or identifying the marginal cost for any change billing determinants. The current approach is relatively non-contentious because it utilizes actual costs and does not require estimates of expected future costs or establishing the expected impact on changes in billing determinants to those cost estimates. (5) <u>Innovation and Flexibility</u> The existing embedded cost tariff design has provided the price signals and incentive to innovate through price responsive behavior and reducing their reliance on grid delivered power. As noted by the AESO, this has led to a "decline in 12-CP billing determinants and resulting cost recovery in 2019".[1] Arguably, the reduction in cost recovery in 2019 represents "pushing costs to other customers". A marginal cost approach may also provide optionality for transmission customers to innovate in response to a more accurate estimate of the expected change in costs related to a change in billing determinant. However, the manner in which shortfalls or surpluses between embedded and marginal costs are handled could create even greater cost shifting to other customers. Moreover, the accuracy of marginal cost estimates and their relationships to billing determinants will largely dictate how much better this approach is than the embedded cost approach but with the additional complexity of managing the potential countersignal that may be created by the way that shortfalls and surpluses are handled. In this regard, the better signal from marginal cost could be unwound by the allocation of shortfalls, which could yield a poorer/more complex signal and still push cost to other customers.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not?	***The objective for any mitigation option should be avoiding the loss of customers***

[1] Slide 23, Bulk and Regional Tariff Design Stakeholder Engagement Session 2, September 24, 2020.

	b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	Customers must be provided transparent, easily accessible and understandable information about the impacts to transmission costs whatever mitigation option is applied. Mitigation such as transition bill impact mechanisms may be preferable to phase in tariff changes because they establish ceilings on the impact to end-use customers. In contrast, phase in tariff changes may provide less certainty about and allow for greater impacts to end-use customer. However, the bill impact mechanism will add additional complexity with establishing threshold values, shifting costs from customers above the threshold to customer below the threshold, and deciding on how long the ceilings will be in effect for. ***Customers should be provided with the greatest flexibility to remain on the system*** The more significant the potential impact of the rate design change, the more options the AESO should provide customers to manage those impacts. In this regard, it is difficult to express a preference for mitigations options without knowing the bulk and regional rate design that the AESO intends to propose and how different that design may be from the existing design. At a minimum, the AESO should consider the use of adjustment mechanisms contract change, and load attraction/retention rates. Additionally, the AESO should consider the wider application of interruptible/standby rates not only as a mitigation option but as a basis for a more modernized tariff design that contemplates the wider adoption of energy storage and greater customer choice with respect to how their electricity needs are met (customer choice). ***Load and customer growth is the solution not rate design*** The issues that AESO has noted about the existing rate design in terms of high charges and declining billing determinants is not going to be addressed by rate design alone. It is clear in the AESO's work presented in its *Delivered Cost of Electricity Estimates* study that high transmission costs have contributed to a situation where self-supply is a highly attractive alternative for large commercial and industrial customers to grid-supplied power. Judicious wires planning in combination with sound rate design needs to set competitively priced grid-supplied electricity as an objective and load and customer growth on the Alberta Interconnected Electric System as its goals. These goals are fully aligned with Alberta's provincial goals with respect to economic growth and prosperity and would deliver on the forecasted need and drivers that underpinned the significant expansion of the bulk (and regional) transmission systems.

		The risk with an approach that views rate design as the solution to a high embedded cost problem is that it is prone to design rates that attempt to capture customers. This runs counter to technological, environmental and social trends that are driving down the cost of renewable and low emission generation (as an alternative to wires and large generation), favour source and sink co-location, and encourage electric vehicles and customer choice (through technological innovation/disruption).
	Questions	**Stakeholder Comments**

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		TransAlta is generally supportive of the areas of agreement presented in Session 4.
		(1) <u>Efficient Price Signals</u>
		The energy-only market design is premised on the wholesale electricity market delivering clear price signals to support efficient decisions on when to add/retire generation. At the outset of the deregulated market, wholesale generation/electricity costs accounted for a significant majority of the overall delivered cost of electricity and transmission costs were low. Given the low cost of transmission, developing on-site generation to reduce/avoid transmission cost was generally uneconomic.
		Over the span of two decades Alberta's transmission costs have increased nearly four-fold and have risen to a level that is almost as high as wholesale generation cost. Concurrently, natural gas has become a highly competitive fuel source, smaller scale generation has become more competitive with larger scale generation, and renewable generation has significantly reduced in cost. Moreover, environmental and social trends have encouraged customers to rethink their consumption behaviours and manage their environmental footprint. These trends have generally increased the importance of factors other than wholesale electricity cost on customer behavior including to a great extent, transmission cost.
		Two things are very clear today: (1) Alberta's transmission tariff charges are significant and are now amongst the highest in Canada, and (2) tariff charges are high enough to drive customers to develop self-supply generation and incent other behavior responses such as reducing consumption at system peaks.
		(2) <u>Cost Responsibility</u>
		Yes, transmission planning drives transmission development and this takes into account more than just load behaviour. It also takes into account generation supply development which is driven by a myriad of factors that drive competition

		to develop the lowest cost sources of generation. However, generation supply development is ultimately responsive to load behavior as private investors/generators are investing into opportunities with the aim to supply customers and future demand for electricity. We also agree the the transmission system is evolving and that current and future use can differ from what was originally planned. This is a critical risk to manage and supports a case and need to add other tools in the Alberta wires development framework such as non-wires alternatives that may reduce planning risk and preserve the optionality to delay expensive, long-lived transmission investment. (3) Minimal Disruption TransAlta agrees that transmission costs are higher than ever before and therefore more important. It is critical that we respond by containing these costs and learn from past lessons to avoid further contributing to transmission cost issues. We also agree that the loss of customers and grid supplied load will serve to make the issue of high transmission costs worse. However, we must also be cognizant that attempting to capture customers to mitigate the risk of ratepayer defection is unlikely to successful. Customers have choice: they can choose to develop their own supply and, ultimately, choose not to operate in Alberta.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
		TransAlta comments on the areas of disagreement are as follows:
		
		(1) Efficient Price Signals
		
		We understand that the AESO's concern is that the customer response to the 12-CP billing determinant has resulted in the decline of 12-CP billing determinant. This would recover less bulk system charge from those customers that have responded to that price signal and recover more from customers that do not respond to that signal. Other than noting this observation, we have little information to judge whether this allocation is fair but it would appear justified by the design - the design was created to incentivize 12-CP response and appears to have been successful.
		
		Given that the price signals are based on an embedded cost approach, it is clear that the historical costs are used. We understand the future transmission costs are not planned or expected to be at the same pace or magnitude as they have been historically, as such, we would expect that the use of historical costs would not produce price signals that would be the same as forward looking costs.

	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs? **Minimal Disruption** • Now is not the time for change or time to stop the bleeding? ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively • Does rate mitigation need to be permanent or will customers adapt if temporary?	(2) <u>Cost Responsibility</u> The primary objective must be viewed within the context of the legislative and policy framework (which, in Alberta, has established cost responsibility) as well as applicable rate design principles including cost causation. It is clear that transmission costs are driven by transmission planning that considers more than just load behavior. Where transmission costs can be clearly delineated to be driven by load behavior, those costs ought to be allocated to loads based upon those drivers. To the extent that transmission costs are driven by other factors such as policy or supply development, they could/should be allocated to load using factors that do not differentiate loads based on behavior. (3) <u>Minimal Disruption</u> We are sympathetic to concerns raised about the significant uncertainty that load customers face at this time. However, the review of the bulk and regional tariff design was directed by the AUC and is a tariff matter that has been raised in previous regulatory proceedings and pre-dates many of the drivers for heighten uncertainty today. Respectfully, there is no ideal time for change for any party that is likely to be face higher costs associated with the change. We also believe that it is important to comprehensively review the bulk and regional tariff design to meet the AUC's direction so as to bring some resolution to the concerns that have been raised previously. As suggested in our comments to Session 4: "We recommend that the AESO use the remaining time and resource effort to perform some cost analysis that could help in the future but may also help to focus the tariff modernization on changes that could provide relief under the current design, support load growth and the competitiveness of the Alberta market, and create new tariff features that can be leveraged in the future if built into our framework." We believe that we ought to comprehensively review the bulk and regional tariff design to meet the AUC's direction. With respect to rate mitigation, as stated in our response to Question 3 above, it is difficult to provide a view about specific mitigation options without knowing what the rate design change may be but we would recommend that: "the more significant the potential impact of the rate design change, the more options the AESO should provide customers to manage those impacts." We would consider all rate mitigation options such as phase ins or bill impact options be temporary but for those mitigation options such as new rates such as interruptible/opportunity rates could be permanent features of the new design.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	No additional comments or considerations at this time.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		TransAlta provides the following comments on the AESO's areas of agreement:
		• Electricity storage is not a producer or end-consumer of electric energy and is not a transmission wire used to transport electricity. However, energy storage is not unique: it exists in many forms (e.g. hydro reservoir storage).
		• Electricity storage is currently limited to participating in Alberta's market with energy price arbitrage and operating reserves. There is no competitive mechanism for electricity storage to be considered as a non-wires solution for regulated service. Electricity storage also provides value in terms of providing other types of ancillary service as well as on-site power quality. Another end-use case is Alberta is for self-supply sites to utilize electricity storage to address the legislative prohibition from exporting without an industrial system designation or under the *Microgeneration Regulation* (and other existing exemptions).
		• We agree that energy storage should be treated fairly and compete in an efficient and openly competitive market.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	TransAlta provides the following comments on the AESO's areas of disagreement: • Electricity storage is a technology type that can used in many different ways including on the grid, behind the meter or both. • Electricity storage may use the transmission system for charging and discharging purpose but is not restricted to only charging and discharging using transmission infrastructure (they can charge behind the meter). • Electricity storage should not pay for inflows if those inflows are directed/controlled by the system controller. As an example, electricity storage can provide frequency regulation services and could be directed to charge by the system controller in the event of a frequency excursion in the performance of the service – the storage asset is being directed to utilize the transmission system to support reliability and not at the discretion of the legal owner.

		• Electricity storage that is co-located with generation behind-the-fence and manages in charging to ensure it only utilizes on-site generation does not utilize the transmission system at all. Such assets should not be charged any transmission costs other than those that apply to supply transmission service because they are managed such that they act effectively as a generation only asset.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	***Energy storage rates should reflect the condition of interruptibility the resource owner is willing to accept*** The AESO should develop energy storage rates that reflect the fact that energy storage assets are likely willing to accept a much greater level of interruptibility that existing DOS rates reflect.
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	No comments at this time.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	No additional clarifying questions at this time.
12	Additional comments	No additional comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020	through	Jan. 12, 2021	**Contact:**	Bryan Krawchyshyn
Comments From:	TC Energy			**Phone:**	403-920-6602
Date:	2021/01/12			**Email**:	Bryan_krawchyshyn@tcenergy.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	TC Energy found both Session 4 – "Bulk and Regional Tariff Design", and the follow-up summary including AESO clarifications, to be valuable for building a shared understanding of common themes between proposals and areas of agreement and disagreement.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	TC Energy supports a cost allocation approach that provides a balanced price signal that will maximize the use of existing network investments and decrease the potential for future network investments. At this time, TC Energy does not have a view whether an embedded or marginal cost allocation approach will more appropriately meet this objective.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here? Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	No Comments.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		TC Energy is supporitive of the areas of agreement.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		TC Energy agrees that the AESO has captured the areas of disagreement presented at Session 4.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	No comments at this time.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Yes. TC Energy supports the areas of agreement for Energy Storage.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	Yes. TC Energy supports the areas of disagreement for Energy Storage.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	TC Energy submits that the AESO should establish a unique rate for energy storage that reflects the unique manner in which it interacts with the transmission system. This is consistent with the tariff's treatment for imports, exports and demand opportunity services. While an appropriate energy storage rate may include multiple components depending on the services being provided, TC Energy supports the development of an interruptible rate option, which recognizes the ability of storage to charge only during times of excess system capacity.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	None at this time.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	None at this time.
12	Additional comments	None at this time

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Kipp Horton
Comments From:	Turning Point Generation (TPG)	**Phone:**	403 233-2259
Date:	Jan. 12, 2021	**Email**:	Kipp.horton@windriver.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, the session was helpful and TPG appreciates the opportunity to provide this feedback.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	At this time, TPG does not have a view on whether an embedded or market cost allocation approach is more appropriate however TPG encourages a rate design which balances the desire to maximize the use of the existing network while minimizes the need for future investment.
3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to acheve with its mitigation(s)? Why?	No comments.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		Yes, TPG is supportive of the areas of agreement presented.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		Yes, TPG is supportive of the areas of disagreement presented.

6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	No comments.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta's electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		Yes, TPG supports the areas of agreement for energy storage.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	Yes, TPG supports the areas of disagreement for energy storage.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	Yes, TPG is supportive of an interruptible rate design for energy storage that appropriately reflects its unique ability to charge only during periods of excess grid capacity. TPG submits that a lower interruptible rate for energy storage will include payment of administration and O&M costs related to system operations.

10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	No comments at this time.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	No comments at this time.
12	Additional comments	None.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – Dec. 10, 2020

Bulk and Regional Tariff Design Stakeholder Engagement Session 4

Period of Comment:	Dec. 10, 2020 through Jan. 12, 2021	**Contact:**	Richard Stout
Comments From:	Alberta Utilty Consumer Advcate (UCA)	**Phone:**	604 366 4184
Date:	2021/01/12	**Email**:	roninconsult@live.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **Jan. 12, 2021**.

The AESO is seeking comments from Stakeholders on Session 4. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 4 hosted on Dec. 10, 2020. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was a valuable review of the tariff discussions to date including a clear explanation of why the status quo cost allocation approach has to be replaced, the impact of an alternative allocation, and the need for transitional mitigation.
2.	Do you have a view on whether an embedded or marginal cost allocation approach will more appropriately meet the AESO's rate design objectives? Why?	The short answer is that it is too early to say if an embedded cost allocation approach based on an estimate of marginal transmission costs would meet the AESO's rate design objectives or lead to appropriate cost allocations. The long answer is that although marginal costs theoretically provide efficient price signals in well functioning markets they are very difficult to achieve in practice for regulated, cost-based rate designs. For cost of service based rate design, marginal costs tend to be employed as to *guide* to structural options (such as opportunity service) rather than as fundamental embedded cost allocators. When used for cost allocation purposes, instability and base-line disputes may arise. The load-facing marginal costs of transmission systems (other than for the local facility connection) are notoriously difficult to estimate. Bulk and Regional transmission system needs are based on complex technical security planning, and socio-economic considerations that are not easily related to measurable load billing determinants such as end-use energy or demand parameters. Additions to Bulk or Regional transmission systems arrive in large, long-lived and expensive increments that change the power flows, expansion needs and interconnection opportunities for generators and loads across wide areas of the interconnected system, leading to controversy over the actual need, timing, stability of, and the real meaning of marginal cost estimates for a transmission system. Marginal cost rate design considerations are even more challenging where price regulated transmission systems must be distinguished from energy price signals in an entirely separate but overlaid competitive energy and generation market. (Note: In the case of a generation capacity market marginal cost estimates may rely on the use of a gas-turbine proxy that would not be suitable as an estimate of the marginal costs of Bulk or Regional transmission systems).

3.	a) Do you have a preference for any of the mitigation options presented at Session 4? Why or why not? b) Do you know of any additional mitigation options that have worked in other contexts and might be applicable here. Please specify. c) What do you think the AESO's needs to achieve with its mitigation(s)? Why?	a) We do not have a particular preference for the mitigation options as long as this does not rely on maintaining the status quo tariff for any existing customer. b and c) The objective is to limit escalation of bills over a transition period for customers who would be most significantly impacted by a move away from the status quo.

	Questions	Stakeholder Comments

4.	Are you supportive of the areas of agreement presented at Session 4? Why or why not? The areas of agreement presented include:
	
	Efficient Price Signals
	• Price signals matter
	  ○ Tariff charges provide incentives for customer behavior
	Cost Responsibility
	• Recognize that more than just load behavior drives transmission development
	• We are dealing with an evolving system
	  ○ Current and future use may differ from what was that originally planned
	Minimal Disruption
	• Transmission costs have risen
	  ○ Tariff charges are more important now than ever before
	• Minimize disruption, mitigate rate shock
	  ○ It is not in anyone's interest to reduce the number of ratepayers
		We are supportive of these general areas of agreement. Providing efficient price signals, reflecting cost responsibility, and mimimizing disruption are all important aspects of Bonbright rate design considerations. Great care must be taken over how these considerations are interpreted and balanced however. For instance:
		
		1)The price signal provided by the transmission tariff must be distinguished from the price signal given by the distinct and competitive energy market.
		
		2) The customer response to a transmission a price signal may not be helpful. In particular, a perceived price signal based on an old vertically integrated cost allocation methodolgy may not have been intended as a price signal at all.
		
		3) In the case of the Alberta Bulk and Regiona transmission system that is legislated to provide **unconstrained** generator market-based dispatch it is very difficult to link any accepted metric of **load** behavior (energy, coincident or non-coincident demand) to Bulk and Regional transmission cost causation.
		
		4) Even as the system evolves, the large sunk cost of assets must still be fairly recovered from all customers that benefit from connection to the system.

5.	Are you supportive of the areas of disagreement presented at Session 4? Why or why not? The areas of disagreement presented include:
	
	Efficient Price Signals
	• Are status quo price signals are efficient?
	  ○ Price signals in tariff have reduced the cost of energy to other load
	• Are price signals forward looking?
	  ○ Price signals are efficient to the extent changes in customer behavior reduce the need for future transmission costs
	
	Cost Responsibility
	• Is the primary objective cost causation, or cost responsibility?
	• Does the initial rate design still achieve goal of cost causation since transmission costs have risen and load behaviour has not influenced those costs?
	
	Minimal Disruption
	• Now is not the time for change or time to stop the bleeding?
	  ○ Economic climate, policy uncertainty, change impacts a few very negatively and many slightly positively
	• Does rate mitigation need to be permanent or will customers adapt if temporary?
		What is commonly described as "price signals" within the Status Quo tariff based on 12CP cost allocations were not intended to be treated as price signals, and do not encourage efficient or desirable behavior on the transmission system.
		
		Energy prices are a separate consideration to transmission price signals in two very different systems. While responses to energy prices may reduce the overall cost of energy, responses to "status quo" transmission price signals simply transfer and increase transmission costs for the vast majority of customers who cannot see the "price signal" or respond to the 12CP monthly "interruption" option.
		
		Our understanding of cost causation on the Bulk and Regional transmission system is price driven load interruptions make little difference to future transmission costs. Since restructuring circa 2000, the Bulk and Regional transmission system has been built primarily to accommodate diverse market based dispatches of generation with minimal constraint (see response to question 4 above) rather than loads.
		
		"Efficient price signaling" to loads therefore carries little weight in transmission rate design when compared to other cirteria such as the fair allocation of existing costs.
		
		We are not clear of the intended distinction between "cost causation" and "cost responsibiity" unless this means that the cost *responsibility* of each customer is to pay a *fair share* of the existing system costs as explained above.
		
		The existing rate design does not reflect cost causation.The 12CP methodology was developed to reflect **generation** cost causation in a vertically integrated and centrally planned system with **no separate energy market**. In the monopoly system that existed prior to 2000 loads were considered to cause all costs because the entire network of generation and transmission was built as a *single* pre-optimized entity where the only significant planning determinant was served load.
		
		When the 12CP allocation was developed the transmission system supported only a *single* planned generation development and dispatch monopoly. Transmission costs were consequently minimal and could be considered to follow the pre-planned generation cost allocation. (Note: direct interruptible credits were available in this integrated pre-market world based on the costs of a proxy gas-turbine. This was considered to avoid some marginal *generation* costs but was not considered to avoid any *transmission* system costs).
		
		The integrated monopoly conditions that supported the use of 12CP no longer apply.Transmission system cost causation has been dramatically changed to support multiple unconstrained dispatch options in an unplanned and competitive

		energy market. Continued use of an outdated and unintended 12CP “price signal” has resulted in unfair cost transfers. It is important to “stop the bleeding” as soon as possible as it effects all customers in every part of the economy. The change is most effectively and practically made in the upcoming filing as ordered by the AUC. As a practical matter it will be three years before the changes affect customer bills when the economic climatewill hopefully have improved and policy uncertainty resolved. Even then, a mitigation mechanism will be provided to minimize any substantive negative impact. Rate mitigation need not be permanent and can be phased out over 5 to 10 years.
6.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement (refer to question 5 above)? Please specify.	None known.

7.	Are you supportive of the areas of agreement for energy storage presented at Session 4? Why or why not?
	
	Energy storage areas of agreement:
	• Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
	• Energy storage can participate in Alberta’s electricity use-cases by providing
	  ○ Energy Price arbitrage
	  ○ Operating Reserves
	  ○ Non-wires solutions for transmission deferral
	• Energy Storage should be treated in a fair, efficient, and openly competitive (FEOC) manner
		We are supportive of the general areas of agreement with regard to energy storage.

8.	Are you supportive of the areas of disagreement for energy storage presented at Session 4? Why or why not? **Energy storage areas of disagreement:** • Is energy storage a user of the grid or a component of the grid or both? • Does energy storage use the network for the Alberta specific use-cases? • Should energy storage pay for inflows and outflows like every other network user or not? • Should energy storage pay for one or more of administration, operations and maintenance, pod, regional, bulk charges?	These areas require more careful consideration as different possible roles that are mutually exclusive require different tariff treatment or applicability. For instance, energy storage operators may use the grid to arbitrage energy prices, in which case STS and DTS tariffs would be applicable like any other network user (such as a load with a BTF generator). On the other hand, where energy storage units contract with the AESO to provide a non-wires solution intended to defer a transmission build, then STS and DTS tariffs would clearly not be applicable. The transmission cost components that energy storage operators pay to use depend on the agreed role of the facility as descrived above.
9.	Are there considerations that the AESO could include in its rate design proposal that would move you to at an area of agreement on any of the areas of disagreement for energy storage (refer to question 8 above)? Please specify.	None known.
10	Do you have any comments on the AESO's proposed stakeholder engagement process, including the mitigation process, for the remainder of the Bulk and Regional Rate Design engagement?	Not at this time. We are looking forward to the next stage of development.
11	Do you have additional clarifying questions that need to be answered to support your understanding?	As above
12	Additional comments	We appreciate all of the efforts that the AESO has made to resolve this issue.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

ADC
Alberta Direct Connect Consumer Association

January 12, 2021

ADC Proposal: AESO Tariff – Mitigation Alternatives – Firm / Non-Firm Tariff

There are 3 distinct types of load users of the transmission system: Firm load, standby load, and interruptible load. Each of these requires a different level and type of service from the Alberta grid. The current 12 CP tariff has specifically been designed to act as a proxy for standby service and provide a price signal for loads to interrupt during system peaks.

The ADC remains of the view that the current tariff design is preferrable; however, recognizes that there could be improvements introduced so that the tariff can remain stable for the long term. An area that ADC has been concerned about is charging CP in the shoulder months where there is no system benefit. This has a productivity impact on energy intensive trade exposed industry who must respond to all coincide peaks in order to remain competitive in Alberta.

The ADC proposes a tariff mitigation option that allows customers to select a firm and non-firm portion of their capacity requirement where the firm portion is charged on a fixed rate per MW and the non-firm portion is charged on a CP basis.

Our proposal simplifies the tariff for all firm loads – a fixed cost per MW of firm capacity requirement. For interruptible and standby loads, it still provides a CP price signal for a proposed 6 months of the year with charges assigned to the contribution to the 4 highest 15-minute intervals in each of the months. This creates a 24 CP tariff. The CP rate proposal is structured such that if a load were not able to respond to the coincident peak they would end up paying more than if they elected firm service. This provides a strong financial incentive for interruptible loads to respond to peaks without being directed to curtail by the AESO.

ADC submits that this proposal provides a long term tariff option that will keep interruptible loads in Alberta, will provide the appropriate price signals to maintain existing and encourage the development of new on site generation where it is the most efficient decision from an energy and transmission infrastructure perspective, and provide billing determinant stability for all Albertans. The ADC also submits that the proposal is consistent with the tariff objectives:

Efficient Price Signals

The regulatory history of the DTS tariff has established in principle that the transmission tariff should send a price signal to minimize future transmission build. This has been accomplished through the CP methodology. The CP rate design has 2 important outcomes:

1. Price responsive / interruptible load respond to system peaks which results in:

- Less generation required to serve the peak load, which means less transmission infrastructure is ultimately needed to serve the peak system load. Alberta has approximately 400 MW of price responsive load. *The CP tariff design has helped keep these energy intensive and trade exposed industries viable in Alberta.*
- Improved grid reliability at times of system stress.

2. To act as proxy for a standby tariff to recognize the benefits of generation development at Industrial sites. The benefits of industrial generation development include:

- Efficient use of existing transmission infrastructure
- Reduces system losses
- More competitive electric energy markets
- More reliable grid
- Reduces grid intensity – environmental benefits

Cost Responsibility

Not all customers require the same level of reliability. This naturally leads to a different tariff for firm and non-firm load or Standby service.

- Firm: requires firm service at all times, regardless of time of day or price signal.
- Non-Firm: Certain customers have a portion of their load requirement that does not require service at all times. A good example is electricity intensive loads that will self-interrupt to remain competitive in Alberta. These loads have invested in storage/generation/production modifications to get off the grid when other customers need grid supply the most.
- Standby: Does not require firm service and uses the grid as backup to on-site generation. Site capacity has been built and established through the DTS contract. These customers have less reliance on the bulk transmission grid.

Minimal Disruption

Minimal disruption is required in order to protect and improve Alberta's economic outlook.

The following sets out the ADC's proposal for mitigation using a rate structure alternative that recognizes the different reliability needs of the grid and sets out billing determinants for Firm and Non-Firm service.

Firm / Non-Firm Rate Proposal

The proposal includes 3 billing categories:

1. Site Capacity: This billing element recovers the local/regional interconnection costs. Similar to the current tariff, the greater of 90% of DTS contract capacity or NCP is used as the billing

determinant for the POD and Regional charges. DOS could continue to be used for short term requirements.

2. Firm Capacity: This billing determinant is used to allocate the Bulk system charges to firm service loads. This value is nominated by the DFO or Direct Connect customer.

3. Non-Firm Capacity: This billing determinant is used to allocate the Bulk system charges to price responsive loads and standby customers. It would apply to all load above the nominated firm capacity.

Other costs such as ancillary services/ voltage support would remain the same as today.

Billing Determinants:

For the purpose of exploring the concept, we have used the 2018 revenue requirement for Bulk and Regional Interconnection Costs of $1,557,500,000. This would need to be updated for the current revenue requirement for further analysis and rate impact modelling. The revenue requirement would be recovered in 3 cost categories:

> **1. Site Capacity Charge:** This charge would recover ~ 25% of the revenue requirement as a demand charge based on 90% contract capacity or monthly non coincident peak (NCP). This capacity charge would have no ratchet and no energy component. This billing determinant would be set at ~$3,250/MW (similar to the current Regional costs if energy and capacity costs are combined).
>
> > Billing determinants: 160,561 MW-Months (~13,380 MW) (as per 2018 filing)
> > Revenue generated: $521,000,000
> >
> > Rate: $3,250/MW/month

The next 2 rate components would need to recover the remaining revenue requirement balance of just over $1,036,000,000.

Propose the Firm capacity rate to be set so that it recovers the entire balance and reduced with a rider (new Rider G) by revenues collected from the non-firm cost category.

> **2. Firm Capacity:** recovers the bulk revenue requirement less the revenue received from the non – firm capacity charges.
>
> > Billing Determinants: 110,000 MW – Months (~9,200 MW)
> > Revenue Requirement: $1,036,000,000 (less non-firm revenue contribution - Rider G)

Rate: $9500/MW/Month less Rider G

Rider G: credit applied to firm capacity $/MW based on non-firm capacity revenue.

3. Non-Firm Capacity: contributes to the bulk revenue requirement, which can be avoided if the non – firm load responds to the CP price signal.

The CP signal is proposed to change from 12 CP to a 24 CP model, but with 4 CP's in the 6 months that the peak matters most. In each of the months of Nov, Dec, Jan, Feb, July, Aug, the peak 4 - 15 min intervals would attract a CP charge for non-firm capacity that was taking grid power at the time.

Billing Determinants: estimated at 30,000 MW – Months (~ 2,500 MW of Standby & PRL)
Rate: $12,000 * 12 CP = $144,000/MW year converted to 24 CP is $144,000/24 CP = $6,000 / MW / CP

Rider G - Revenue contribution: Depends on when the Non-firm load uses the system and if they are successful at responding. If they are not successful, they would pay a premium to the firm service, for example:

10 MW of Firm = 10MW x $9500 X 12 = $1,140,000
10 MW of non-firm = 10 MW X $6000 X 24 = $1,440,000

A DFO/DC customer would not select the non – firm rate if they had no ability to respond as they would end up paying a premium.

Terms and Conditions

There may need to be additional terms and conditions around the election of the firm/ non-firm levels. An example is that there is an allowance for POD's to nominate firm/non-firm capacity once per calendar year so it is set for 12 consecutive months.

The concept is illustrated through the following examples:

1. Firm DFO site with 50 MW DTS contract capacity and 48 MW NCP:

50 MW Firm

Site Capacity Charge: 48 MW X $3,250 X 12 = $1,872,000

Firm Capacity Charge: 48 MW X $9,500 X 12 = $5,472,000

Total Annual: $7,344,000

2. Firm & non-firm DFO/DC site with 50 MW DTS capacity, NCP 48 MW, 20 MW firm, 30 MW non-firm.

a. avoided CP 80% of the time

Site Capacity Charge: 48 MW X $3250 X 12 = $1,872,000

Firm Capacity Charge: 20 MW X $9,500 X 12 = $2,280,000

Non-Firm Capacity Charge: 30 MW X $6,000 X 24 CP X 20% = $864,000 (With 80% avoidance)

Total Annual: $5,016,000

b. avoided CP 0% of the time

Site Capacity Charge: 48 MW X $3250 X 12 = $1,872,000

Firm Capacity Charge: 20 MW X $9,500 X 12 = $2,280,000

Non-Firm Capacity Charge: 30 MW X $6,000 X 24 CP X 100% = $4,320,000 (With 0% avoidance)

Total Annual: $8,472,000. (by not avoiding CP, non-firm becomes a premium to firm service)

3. ISD – Cogen Site with 50 MW DTS Capacity (90% is 45MW), NCP 0 MW, 0 MW firm, 50 MW non-Firm

a. avoided CP 95% of the time.

Site Capacity Charge: 45 MW X $3,250 X 12 = $1,755,000

Firm Capacity Charge: 0 MW X $3500 X 12 = $0

Non- Firm Capacity Charge: 50 MW X $6,000 X 24 CP X 5% = $360,000 (95% avoidance)

Total Annual: $2,115,000

b. avoided CP 0% of the time.

Site Capacity Charge: 45 MW X $3,250 X 12 = $1,755,000

Firm Capacity Charge: 0 MW X $3500 X 12 = $0

Non- Firm Capacity Charge: 50 MW X $6,000 X 24 CP X 100% = $7,200,000 (0% avoidance)

Total Annual: $8,955,000 (by not avoiding CP, non-firm becomes a premium to firm service)

Rider G: In the case of 2a and 3a, the total non-firm capacity cost recovery of $360,000 + $864,000 = $1,224,000 would be returned as Rider G. In the case of 2b and 3b, the total non-firm capacity cost recovery of $4,320,000 + $7,200,000 = $11,520,000 would be returned as Rider G. This rider amount would go to reduce the firm capacity charge.

The ADC has performed some initial rate impact analysis and while most interruptible and standby customer would see rate increases it is at a manageable level.

The ADC wishes to explore this rate mitigation option further with the AESO to update the potential rates to reflect the current revenue requirement.

Monday, January 4, 2021

Dear AESO Stakeholders:

Re: **Important Clarification on Bulk and Regional Tariff Design Rate Impacts**

We would like to thank stakeholders for their ongoing involvement in the AESO's Bulk and Regional Tariff Design over the past several years. Your participation to date has been both insightful and informative and has helped the AESO to better understand your perspectives as we advance our bulk and regional rate design.

As we have previously noted, we are keenly aware of the current economic environment in the province and know that a rate design that changes cost structures in a manner that could increase costs for any business must be done thoughtfully and in the public interest.

To that end, we would note that the original bookends A and B and the initial analysis of rate impact implications for the three coincident peak (12-CP) responder categories, shared at our Sept. 24, 2020 session, were outer bounds of possible shifts. The resulting rate impacts represented starting points for rate design work to progress from; they were never intended to indicate a likely or expected outcome as they lacked any modifications and mitigation to support a minimally disruptive implementation. The AESO recognizes that this concept of bookends and associated rate impacts has created much angst and concern among certain stakeholders. We therefore want to take this opportunity to clarify that it has never been the AESO's intent to move forward with a one-time +100 or +130 per cent rate increase to broad groups of customers in our bulk and regional rate design development. We are committed to look for rate design and mitigation options that will provide a transition path to phase in changes and provide customers the opportunity to respond to the new rate design.

We recognize our rate design and corresponding mitigation options will need to fit within an appropriate and fair rate impact threshold that will need to be reviewed and approved by the Alberta Utilities Commission (Commission). In previous proceedings, the Commission provided direction that any rate increase of more than 10 per cent be examined in further detail. This threshold will be relied upon as a guide as we advance the complex rate design process. Within every category of consumer and within every industry, there are sites that would be both worse off and better off depending on the final rate design. The AESO is investigating transition options with stakeholders, both in the form of rate design as well as rate impact mitigation, as part of our engagement process. This engagement will continue through the first half of 2021 to find the right solution for recovering current costs and creating the right signals for the future.

When we share our preferred rate design, we will also provide a bill impact summary and a list of our assumptions with a corresponding Bill Impact Tool. The Bill Impact Tool will assist affected stakeholders in assessing their bill impacts and mitigation options. We welcome any interested stakeholder to meet with the AESO to review the Bill Impact Tool and our assumptions and to ensure they understand how they will be impacted and the potential mitigation options available to them.

We are focused on developing a bulk and regional tariff design that will support Alberta over the long-term as the electricity system transforms while also providing for a minimally disruptive transition to the new rate

@theaeso

design. At the same time, consumers need clear and stable price signals to be provided by the ISO tariff so they can make effective business decisions. The AESO is committed to providing clarity on this rate design change which has been underway for several years, and filing a bulk and regional rate design application, including mitigation for rate shock, by the end of June 2021, as directed by the Commission. Given the steps in the regulatory process, we anticipate the earliest the new rate design would come into effect is 2023.

Your continued participation in this engagement is critical to help us prepare a well-informed application for submission to the Commission, for the benefit of Albertans in the long-term.

If you have questions or would like to discuss this matter further, please contact me at Miranda.Erickson@aeso.ca.

Sincerely,

Miranda Keating Erickson

Public

Agenda

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Session purpose and objectives

The purpose of this session is to present and discuss the AESO's preferred rate design. The session objectives include:

- Present preferred rate design, including energy storage treatment, to stakeholders
- Present and discuss path to achieving minimal disruption
- Present bill impact summary and assumptions
- Provide Bill Impact Tool
- Begin to discuss implementation considerations

Date: **Thursday, March 25, 2021**
Time: **8:00 a.m. – 4:00 p.m.**
Location: **Zoom Webinar**
Facilitator: **Stack'd**

Time	Agenda Item	Presenter
8:00 – 8:10	Welcome, introduction, purpose, and session objectives	AESO / Stack'd
8:10 – 8:30	Opening remarks • Case for change • Key highlights	AESO
8:30 – 8:50	What we heard • Cost responsibility • Efficient price signals • Embedded and marginal approaches	AESO
8:50 – 10:30	Methodology and analysis • Summary of rate design • Review and elimination of marginal approach • Improvement to embedded approach	AESO / NERA
10:30 – 11:00	Break	
11:00 – 12:30	What we heard, methodology and analysis • Q&A	AESO / NERA
12:30 – 1:00	Break

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

March 25, 2021

Public

Notice

In accordance with its mandate to operate in the public interest, the AESO will be audio recording this session and making the session recording available to the general public at www.aeso.ca. The accessibility of these discussions is important to ensure the openness and transparency of this AESO process, and to facilitate the participation of stakeholders. Participation in this session is completely voluntary and subject to the terms of this notice.

The collection of personal information by the AESO for this session will be used for the purpose of capturing stakeholder input for the Bulk and Regional Tariff Design engagement sessions. This information is collected in accordance with Section 33(c) of the *Freedom of Information and Protection of Privacy Act*. If you have any questions or concerns regarding how your information will be handled, please contact the Director, Information and Governance Services at 2500, 330 – 5th Avenue S.W., Calgary, Alberta, T2P 0L4, by telephone at 403-539-2528, or by email at privacy@aeso.ca.

Using Zoom – Asking questions

- Two ways to ask questions if you are accessing the webinar using your computer or smartphone
  - Click “Raise Hand” and the host will be notified that you would like to ask a question. The host will unmute your microphone, you in turn will need to unmute your microphone and then you can ask your question. Your name will appear on the screen, but your camera will remain turned off.
  - Click “Lower Hand” to lower it if needed.
  - You can also ask questions by tapping the “Q&A” button and typing them in. You’re able to up-vote questions that have been already asked.
- If you are accessing the webinar via conference call
  - If you would like to ask a question during the Q&A portion, on your phone’s dial pad, hit *9 and the host will see that you have raised your hand. The host will unmute your microphone, you in turn will need to unmute your microphone by hitting *6 and then you can ask your question. Your number will appear on the screen.

Stakeholder participation

The participation of everyone here is critical to the engagement process. To ensure everyone has the opportunity to participate, we ask you to:

- Listen to understand others' perspectives
- Disagree respectfully
- Balance airtime fairly
- Keep an open mind

Welcome and Introductions

Public

Session purpose and objectives

- The purpose of this session is to present and discuss the AESO's preferred rate design. The session objectives include:
  - Present preferred rate design, including energy storage treatment, to stakeholders
  - Present and discuss path to achieving minimal disruption
  - Present bill impact summary and assumptions
  - Provide Bill Impact Tool
  - Begin to discuss implementation considerations

Overview of Engagement Process

Public

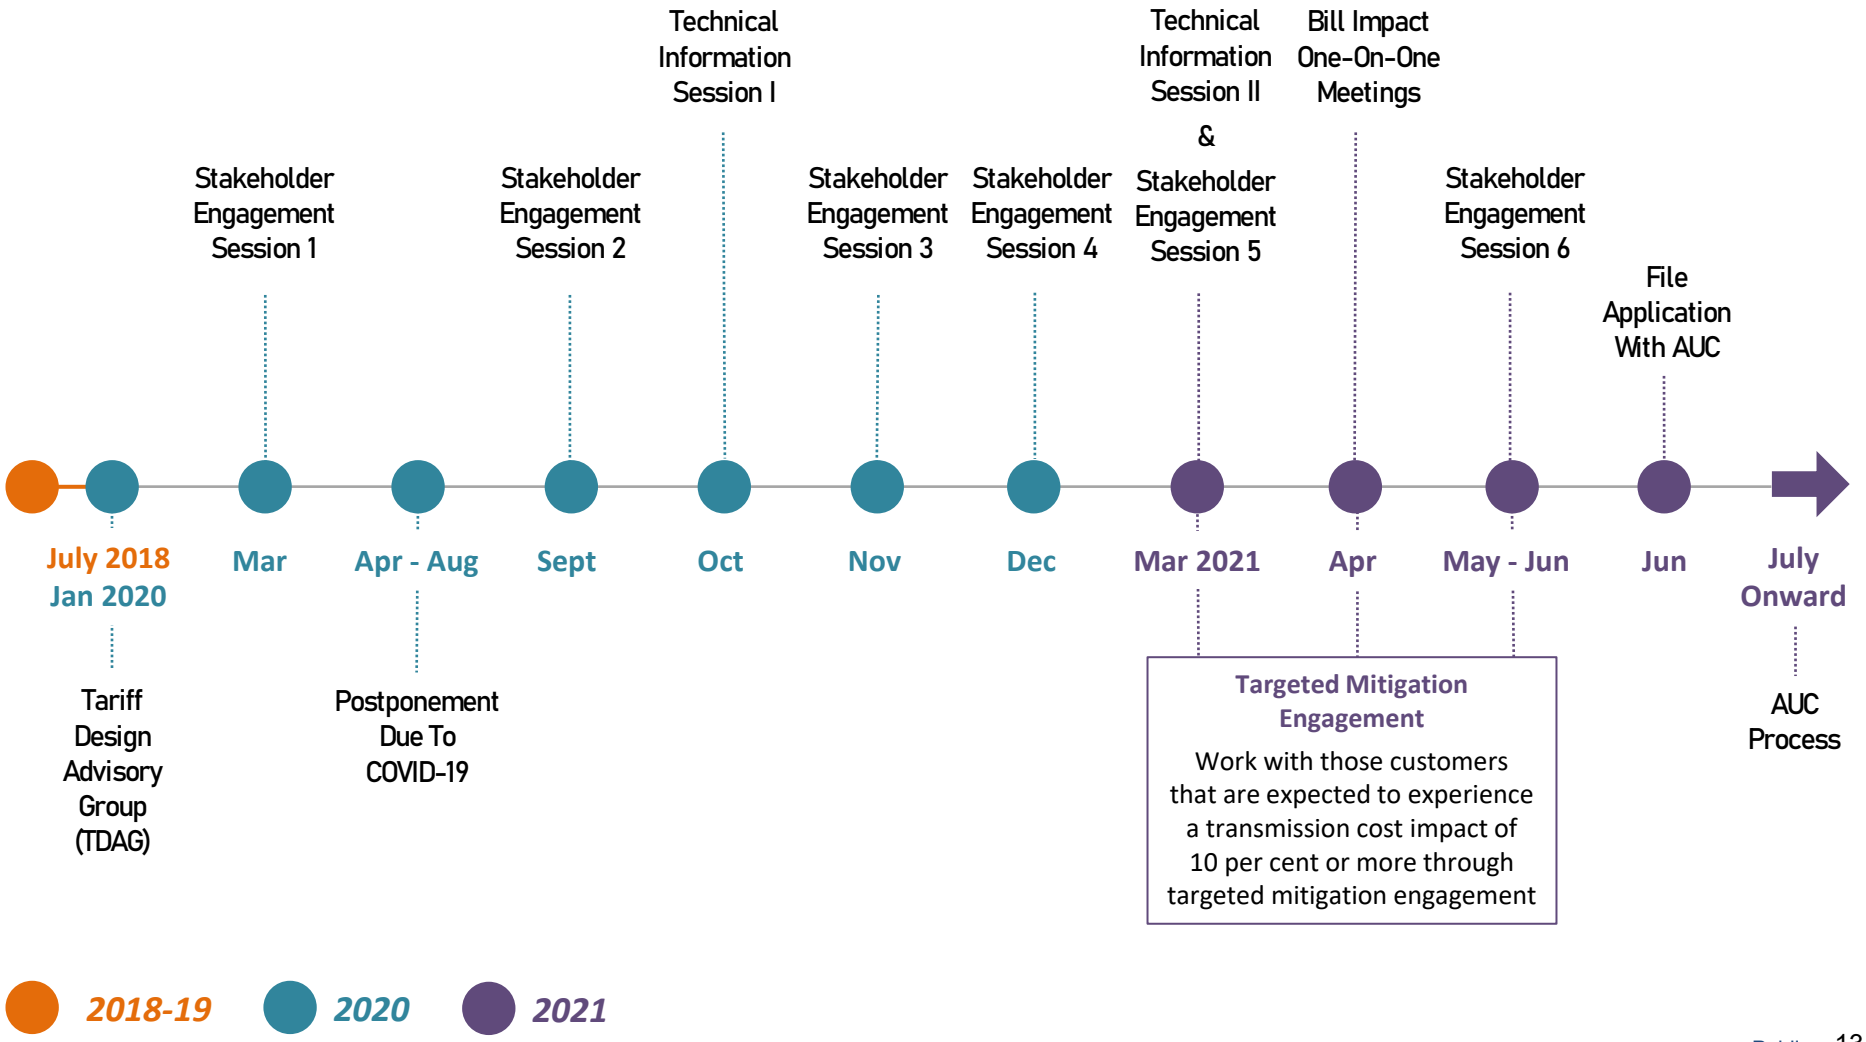
AESO Stakeholder Engagement Framework

Stakeholder engagement

The AESO's stakeholder engagement will:

- Ensure that stakeholders' needs and interests are consistently, transparently and meaningfully considered in the development of a rate design proposal for bulk and regional cost recovery;
- Provide clear objectives to be examined and evaluated in the development of a rate design proposal for bulk and regional cost recovery;
- Assist stakeholders in understanding and evaluating the AESO's preferred rate design;
- Supply stakeholders with tools that will allow them to consider and assess the impact of the AESO's preferred rate design; and
- Identify areas of alignment in order to support an efficient regulatory process.

Stakeholder engagement timeline



Opening Remarks

Public

Case for change

- Since its introduction, the 12-CP rate has increased substantially with significant new investments in the grid to support economic growth and integrate new resources
  - Costs to be recovered are sunk, need to recover these costs to pay for the transmission system
- Substantial peak rate increase has resulted in an increasing risk of cost avoidance at peak hours by customers who can change when they consume power
  - With the current rate design, seeing a negative feedback effect
- The current design is no longer sending effective pricing signals
  - As the transmission system is reinforced and available for use, the weighting of the 12-CP price signal has diverged from the value it creates for the system
- Current rate design does not reflect the drivers of transmission costs to adjust with changes occurring in the landscape of Alberta's electricity system
- Improvements need to be made now so that any future investment decisions are made under the new rate design

Key highlights

- Sharing our preferred rate design today to build understanding and seek input
  - The preferred rate design strikes the right balance moving forward by allocating costs more appropriately to better reflect a customer's use of the system, putting the appropriate long-term price signals in place while also providing for a transition path of minimal disruption
  - Preferred rate design has shifted away from the bookends and stakeholder proposals presented in the fall
- Rate impact is much less impactful than previously estimated
  - Nearly all customers facing an increase will see a rate impact of less than a 10 per cent increase (to both total bill and transmission bill)
  - AESO seeking to mitigate challenges for the few customers who would see a 10 per cent or greater increase in transmission costs through a targeted engagement
  - Many customers (including residential, commercial, and industrial customers) can expect a reduction in transmission costs relative to today

Design objectives

Objective	Description
Reflect Cost Responsibility (updated)	Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*
Efficient Price Signals	Price signal to alter behavior to avoid future transmission build
Minimal Disruption	Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted
Simplicity	Simplicity and clear price signals while achieving design objectives
Innovation and Flexibility	ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers

*AUC Decision 22942-D02-2019

**Proposed rate design must fit within current legislative framework

Your participation

- Your participation to date has been very insightful to the AESO in understanding your perspectives and helping the AESO develop its preferred rate design proposal
- Your continued participation in this engagement is critical to help us prepare a well-informed application to the AUC for the benefit of Albertans
- We are looking for collaborative solutions to minimize the disruption for customers who are impacted by these changes, and your continued engagement is critical for our success
- AESO recognizes the importance of providing clarity on this initiative for all of Alberta's electricity consumers

What We Heard

Public

Session 4 feedback on cost responsibility

- What we heard
  - Cost causation is primary principle that proposed tariff design must meet
  - Embedded approach is likely to best meet cost causation principles
  - Cost recovery must be based on the drivers of the costs to provide transmission service to customers
- In developing the preferred rate design and taking into account stakeholder feedback, preferred rate design is rooted in cost causation, therefore meeting cost responsibility objective

Session 4 feedback on efficient price signals

- What we heard
  - Current tariff design provides price signals allowing customers to manage costs
  - Price signals should be widely available to be adopted by different types of customers
  - Marginal cost approach might be appropriate (including in combination with embedded approach), but relies on forecasts and additional complexity which hamper ability to achieve a more efficient outcome
- AESO views that the embedded approach to cost allocation remains appropriate in that rates based on cost causation will provide cost reflective price signals

Session 4 feedback on approaches

Embedded Approach

- Most appropriately aligns with AESO's design objectives around cost responsibility and would cause the least disruption (several)
- More likely to achieve rate design objective of minimal disruption as AUC and stakeholders more familiar with this approach (several)

Marginal Approach

- Support but would require reallocating existing costs to ensure cost recovery (one)
- May more fully meet rate design objective of sending efficient price signals (several)

Combined Approach / Trade-offs

- Promoted a combination of both to cover past and future investments as well as both incremental (covered by marginal) and embedded costs (several)
- Trade-offs between the two approaches need to be considered as each approach may more fully meet different rate design objectives (several)
- Removing price signals completely will result in inefficient behaviour (several)

Methodology and Analysis

Public

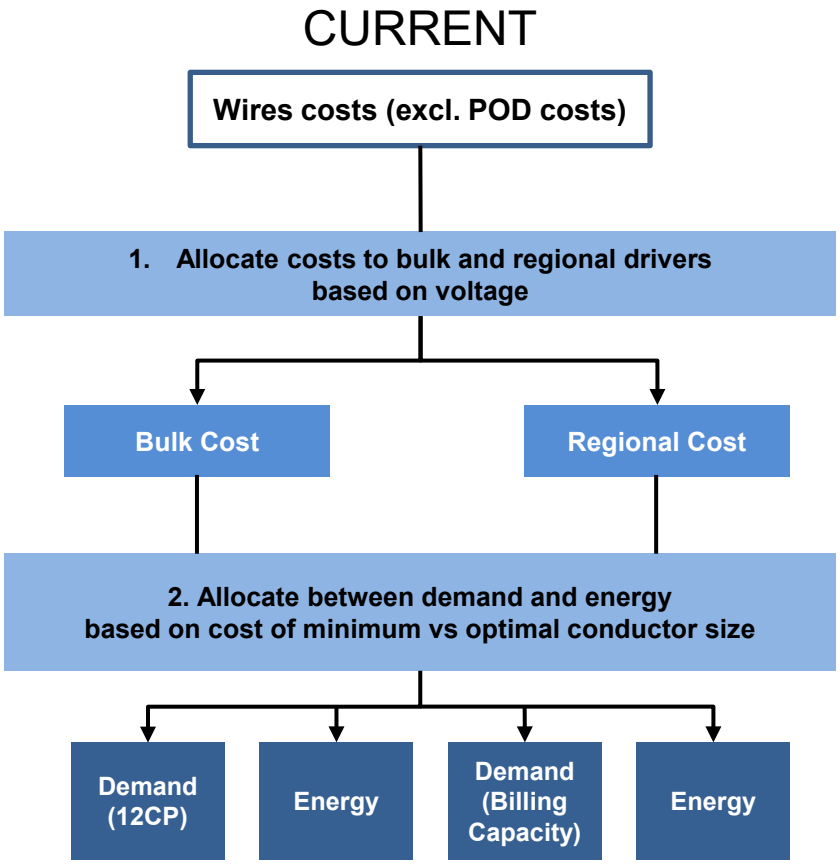
Tariff redesign process

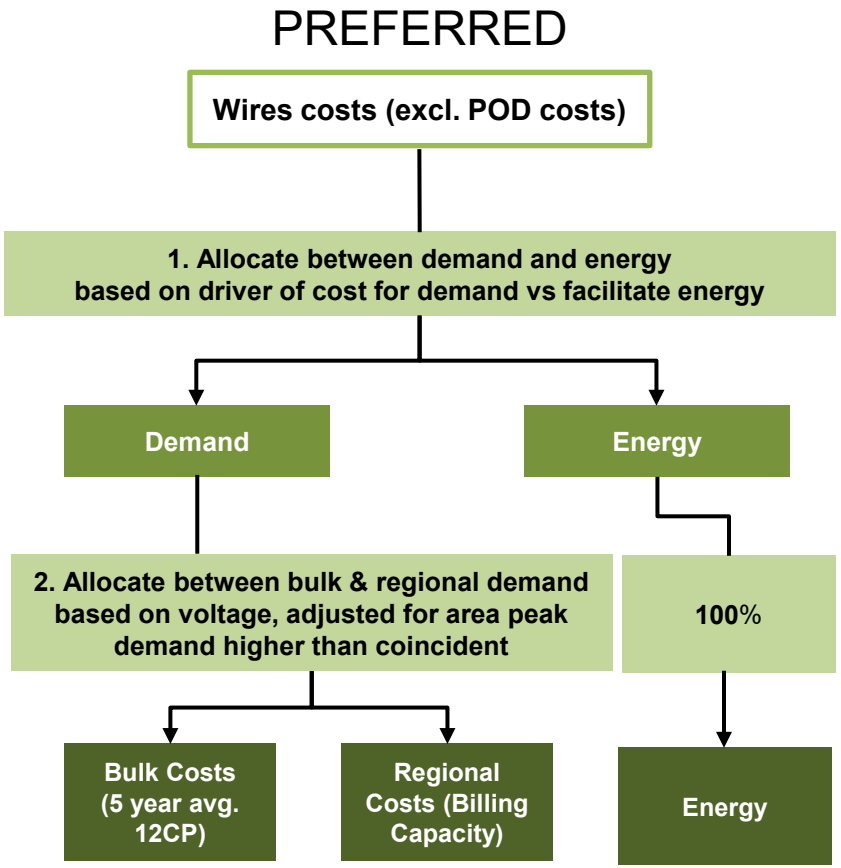
- NERA Economic Consulting has been retained as an expert
- AESO is adopting and proposing NERA's tariff design
- Richard Druce from NERA is an expert in tariff design and is attending this session to respond to questions from stakeholders on the preferred rate design

Summary of rate design

- AESO's preferred rate design relies on an embedded approach, with improvements to better reflect cost causation
  - Relies on concept of minimum system in current tariff, which has been improved to align with transmission system use
- Many stakeholders have stated that an embedded approach remains appropriate for Alberta
  - Identified that updating the current embedded approach is likely the best way to meet tariff design objectives
- AESO's preferred rate design reflects an effective balance in meeting our tariff design objectives

Current and preferred rate design





Current and preferred rate design

Type of charge	Cost Allocation (do not sum due to rounding)		Charges Estimated for 2019 test year	
	Current	Preferred	2019 Test Year	Preferred
Coincident Peak ($/MW month)	47%	29%	10,087	5,980
Energy* ($/MWh)	7%	31%	2.18	10.19
Billing Capacity ($/MW month)	22%	17%	2,668	2,055
POD (**out of scope**) ($/MW month)	24%	24%	N/A	
Total	**100%**	**100%**	**N/A**	

*Current energy charges are the sum of bulk and regional components

Recommended approach aligns costs with drivers

- The preferred rate design characterizes use of the system to allocate the costs of transmission
  - Divide costs between demand-related cost drivers and costs driven by facilitating in-merit flow of energy-related costs
  - Divide demand costs between costs associated with coincident peak consumption and customer's own peak loads
  - Energy charge will increase; peak and billing capacity charge will decrease relative to current tariff
  - No changes to the current types of charges from current tariff: billing capacity charge, energy charge, peak charge (with five-year trailing average)
- Better aligns charges with use of the system, reducing opportunity for customers to shift costs to others by reducing demand at peak hours
  - Customers who wish to manage costs through peak avoidance remain able to do so, but charges are more reflective of the associated costs

Review and Elimination of Marginal Approach

Public

Consideration given to marginal approach

- Discussion in Session 4 about use of embedded and marginal approach to cost allocation
  - Marginal approach is based on estimating the incremental cost of supplying one more unit of demand
    - **Marginal cost**: Change in cost to serve one more customer/MW with next increment of capacity
    - **Residual cost**: Difference between marginal costs recovered and revenue requirement needs to be recovered to minimize distortions
- The suitability of marginal approaches for transmission cost allocation in Alberta was evaluated
  - Applying marginal approach to Alberta context leads to relatively low marginal costs and proportionally higher residual costs
  - Price signal from marginal would be diluted by residual cost recovery
  - Marginal price signal would not encourage efficiency unless pricing is locational since costs vary by location

Marginal approach does not meet rate design objectives

The AESO has assessed that the marginal approach to cost allocation will not meet our rate design objectives based on the following:

- Reflect Cost Responsibility
  - Cost causation could be achieved to the extent marginal rates appropriately reflect costs, but costs will vary by location
- Efficient Price Signals
  - Efficient price signals would need to vary by location and recovering significant portion of residual costs would undermine efficiency of price signal
- Minimal Disruption
  - Marginal cost allocation requires significant residual cost recovery, limiting the gains from efficient price signals and likely to be more disruptive
- Simplicity
  - Calculation of marginal rates relies on forecasts of future growth and future costs, resulting in a greater degree of complexity relative to the current approach
- Innovation and Flexibility
  - Potential to encourage additional price responsive participation, extent of flexibility depends on the basis for calculations

Questions

Public

Improvements to Embedded Approach

Public

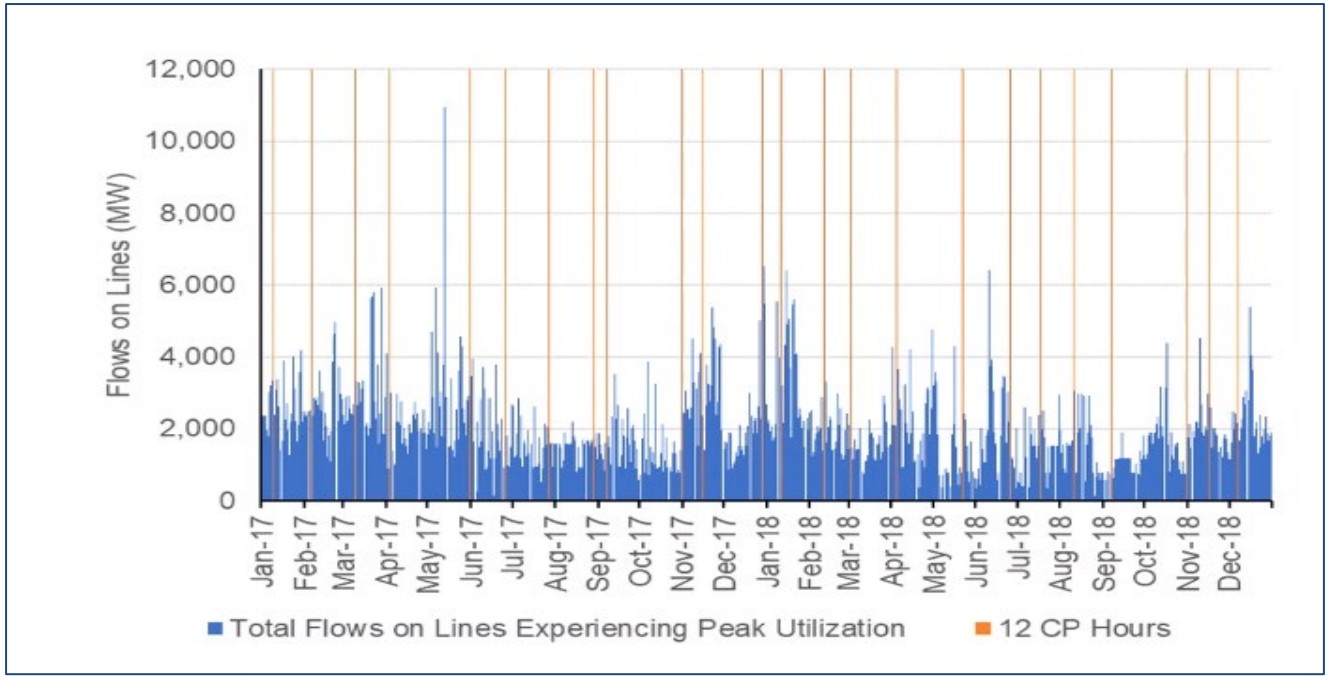
Overview of embedded approach

- The following context frames the AESO's preferred rate design
  - High level overview of transmission cost causation as it applies to the Alberta transmission system
  - An explanation of allocating costs between demand and energy
  - An explanation of functionalizing costs between bulk and regional
  - Allocation of costs to billing determinants
  - Evaluation of preferred rate design against objectives
- Design alternatives that were considered and dismissed are described in the Appendix

Bulk transmission system use

- Demand at times of coincident peak is not the only driver of bulk transmission system utilization
  - Peak bulk line utilization: When a bulk line has flows in an hour greater than 90 per cent of the maximum flow for the year

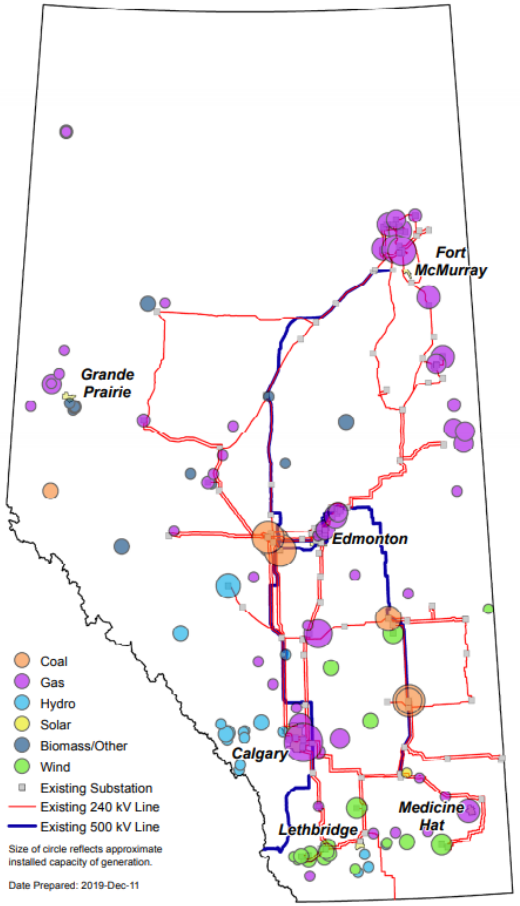
Hours of 12-CP do not necessarily correspond to hours of peak utilization across high-voltage lines



Source: NERA Analysis of SCADA flow data provided by the AESO

Other drivers of transmission system costs

- Other drivers of transmission system costs are not adequately reflected in current tariff
- Flows on transmission system associated with seasonal patterns
- Changes in the regional pattern of in-merit energy drive costs
  - When there are changes in generation dispatch in one region, this affects flows to varying degrees in other regions



Transmission costs associated with energy use

- Energy charges in the current tariff do not explicitly reflect that transmission costs are incurred to enable the flow of in-merit energy
  - Recognizing that transmission costs are allocated to load customers, the costs of facilitating the flow of in-merit energy are not demand related, they are energy related
    - **Demand related**: Costs associated with transmission needed to meet demand
    - **Energy related**: Costs associated with transmission needed to provide in-merit energy
  - The current cost allocation methodology would allocate some of the costs of enabling the flow of in-merit energy to demand

Minimum and actual system approach

- The AESO's preferred rate design allocates transmission costs between demand and energy prior to functionalization of demand-related costs
  - Better matches the fact that the AESO does not distinguish between voltage levels when planning transmission solutions to enable the in-merit flow of energy
  - Better distinguishes the costs that are demand driven and those that enable the flow of in-merit energy

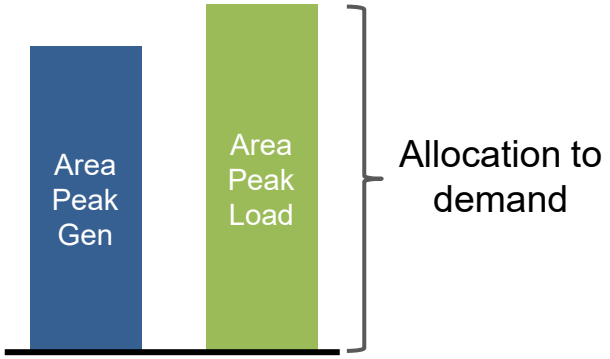
Minimum and actual system calculation

The following methodology is applied to determine the portion of costs allocated to demand and energy

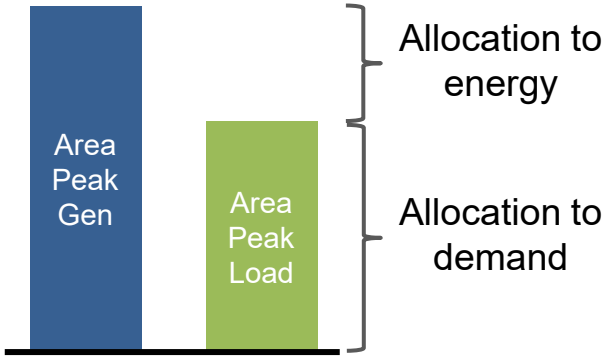
- **Minimum system**: Estimate of the transmission system required to meet peak load (demand)
- **Actual system**: Estimate of the additional transmission system required to facilitate the in-merit flow of energy
- Minimum and actual systems for Alberta are estimated as the sum of the minimum and actual systems across all planning areas
- Calculate the demand-share of costs based on the size of minimum and actual systems for Alberta

The resulting allocations for 2020 are 60 per cent demand and 40 per cent energy, and have changed minimally since 2015

Example of an area where peak gen < peak load



Example of an area where peak gen > peak load

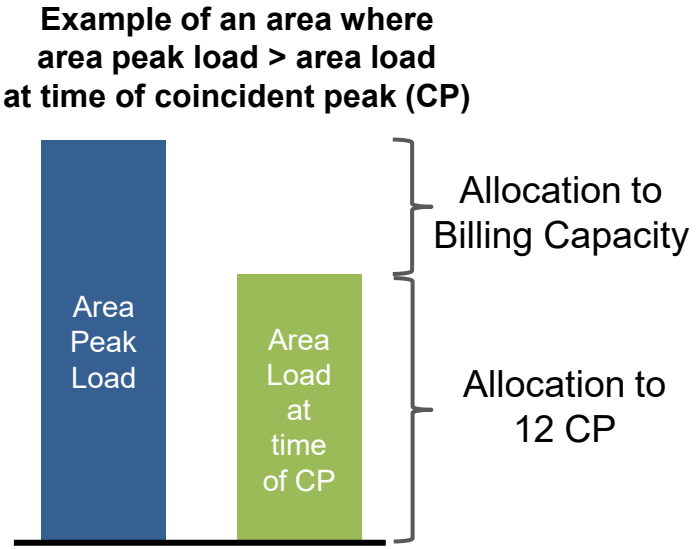


Functionalize demand share of costs

- Functionalize demand-related costs by proportion of book value of assets on the basis of current voltage threshold (240 kV) as a reasonable approximation of the bulk and regional share of costs
  - Low voltage lines more likely to serve a regional purpose
  - High voltage lines are more likely to serve a bulk purpose
  - Consistent with the approach used today but applied only to the demand portion of costs

Adjustment to bulk system share of costs

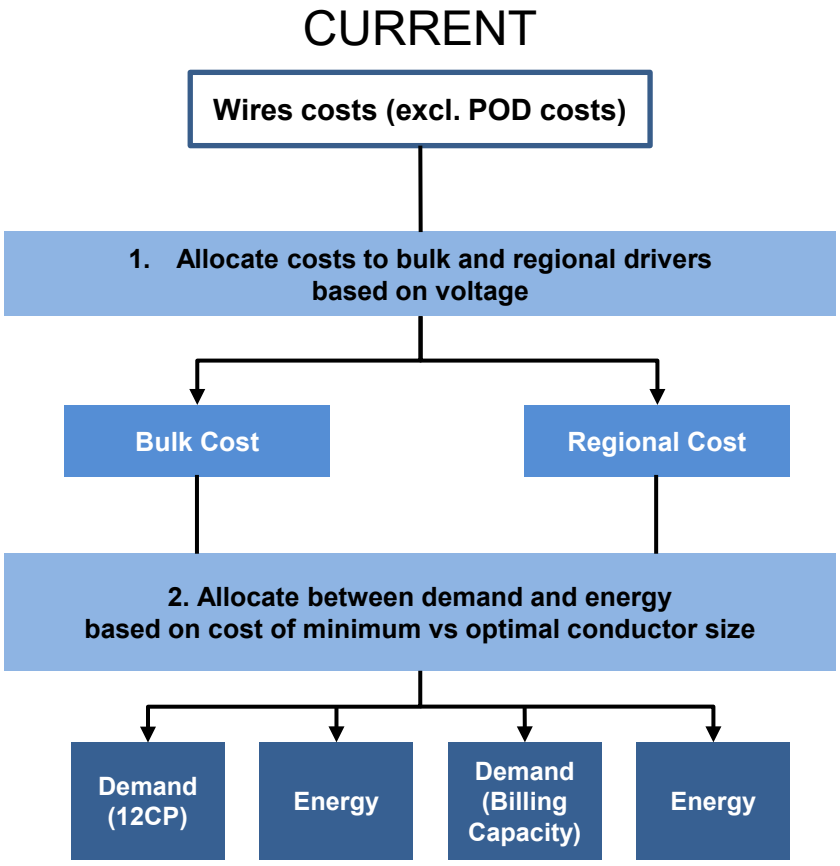
- Size of the bulk system primarily driven by system peak demand, but may need to be larger in areas where the load peaks at times other than the coincident peak
  - The portion of the bulk system that is used to accommodate peaks outside of the coincident peak is allocated to the billing determinant that reflects non-coincident peak (i.e., billing capacity)

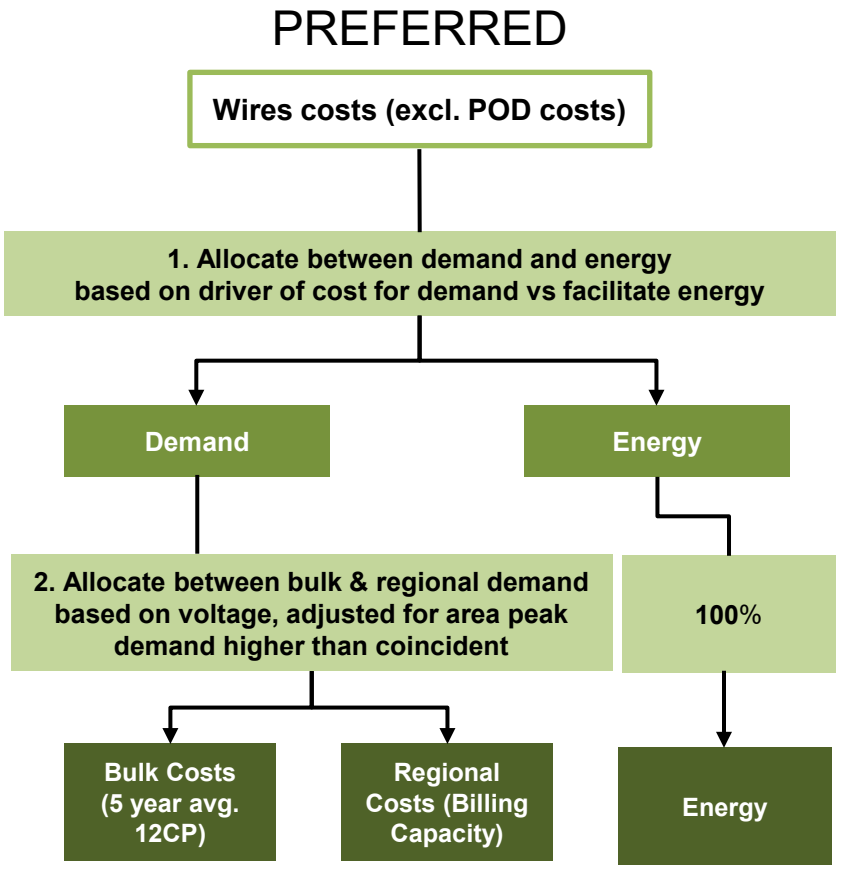


Billing determinants to reflect cost causation

- Majority of bulk demand-related costs recovered on five-year trailing average of monthly coincident peak
  - More appropriately reflects how consumption over the longer-term drives transmission costs
  - Five-year average will be phased-in
- Regional demand-related costs (and remaining bulk costs) recovered on billing capacity charge
  - Regional system is scaled to meet non-coincident peak demand
- Energy-related costs recovered on energy charge
  - Transmission system is planned to facilitate the in-merit flow of energy at all times of the year, so energy use in all hours matters for transmission costs

Review: Current and preferred rate design





Review: Current and preferred rate design

Type of charge	Cost Allocation (do not sum due to rounding)		Charges Estimated for 2019 test year	
	Current	Preferred	2019 Test Year	Preferred
Coincident Peak ($/MW month)	47%	29%	10,087	5,980
Energy* ($/MWh)	7%	31%	2.18	10.19
Billing Capacity ($/MW month)	22%	17%	2,668	2,055
POD (**out of scope**) ($/MW month)	24%	24%	N/A	
Total	**100%**	**100%**	**N/A**	

*Current energy charges are the sum of bulk and regional components

Resulting rates will meet our rate design objectives

- Reflect Cost Responsibility
  - Resulting rates reflect costs of using the transmission system, including costs associated with in-merit flow of energy, local and peak use of the system
- Efficient Price Signals
  - Resulting rates provide transparent price signals to customers that better reflect the cost drivers of the transmission system
- Minimal Disruption
  - Resulting rates are based on similar billing determinants that customers understand (overall cost impacts discussed later in the presentation)
- Simplicity
  - Resulting rates are comparable to current rates in terms of level of complexity
- Innovation and Flexibility
  - Additional flexibility to allow allocations to change over time reflecting evolution in how the transmission system is used

Break

Public

Question Period

What We Heard and Methodology and Analysis

Public

Break

Public

Bill Impact Summary

Public

Overall summary

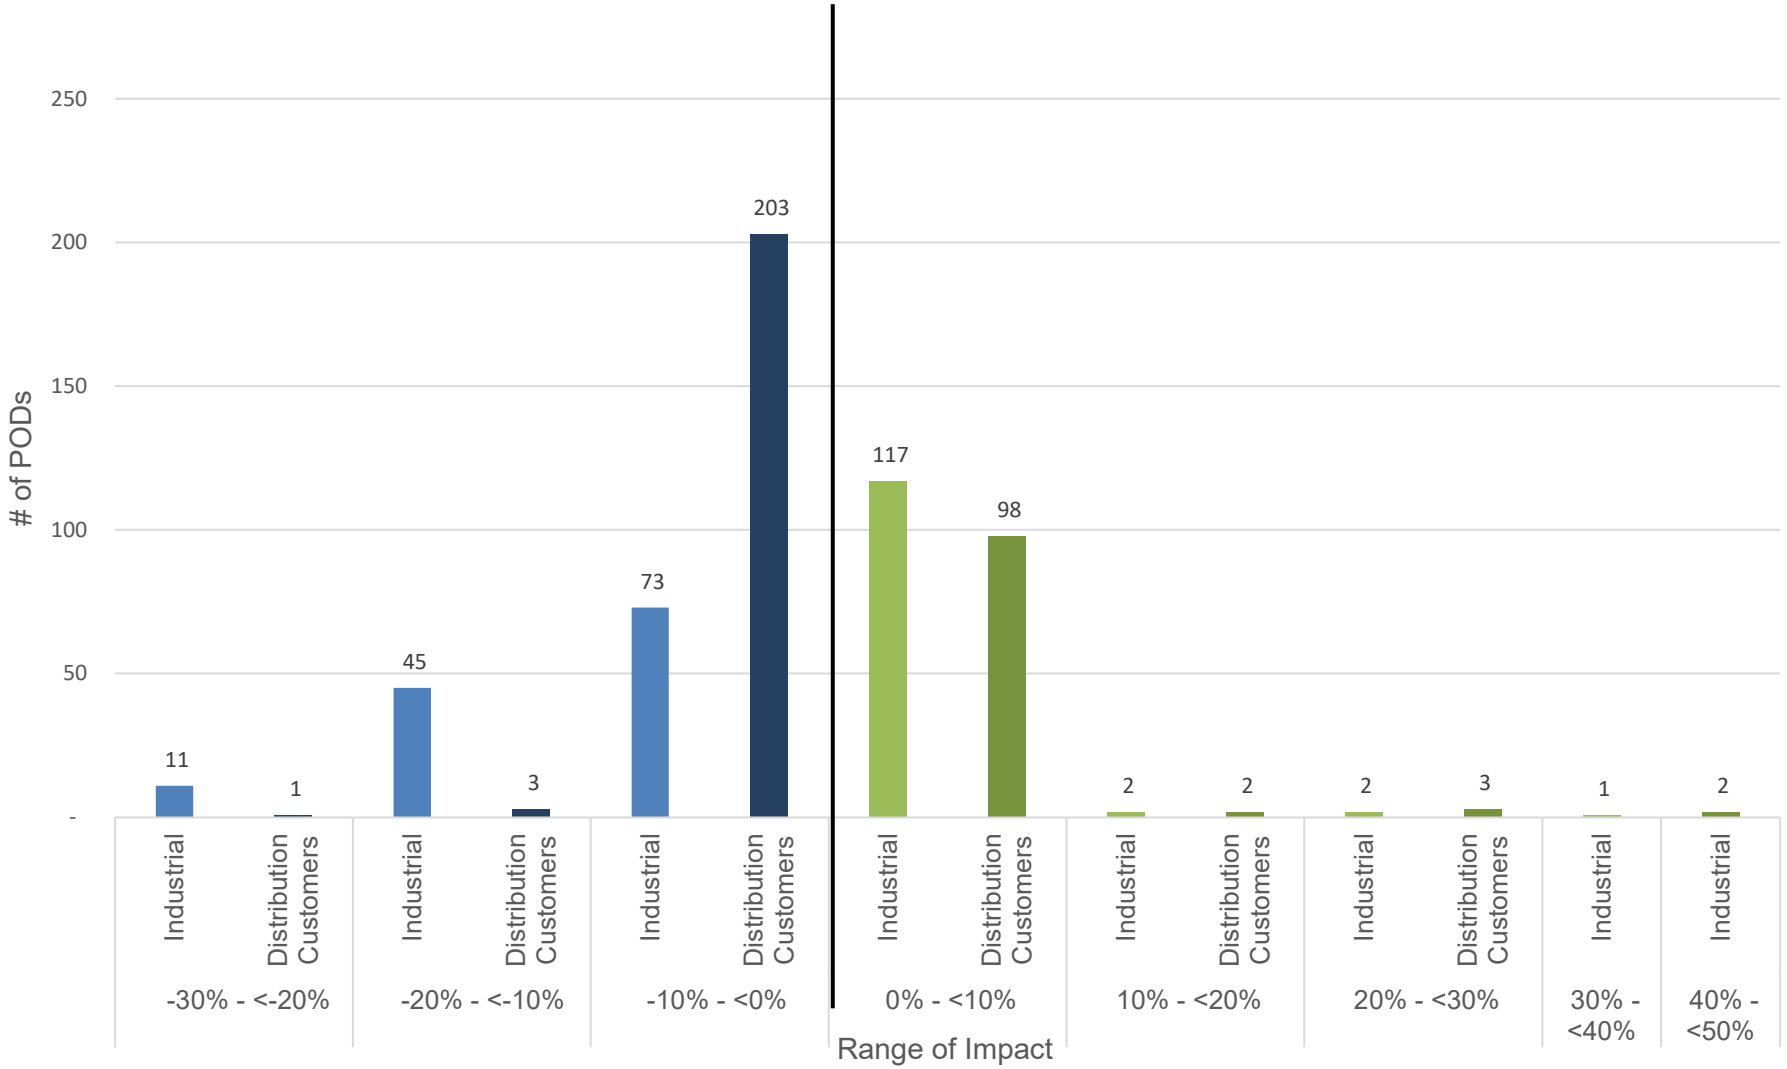
- Total shift in transmission cost recovery will be small
  - Total change less than three per cent of total transmission system costs
- Prior to any mitigation, it is not expected that any customer would have a total bill increase of more than 15 per cent
  - Before we apply any mitigation, a few customers may see up to a 50 per cent increase in transmission costs (15 per cent or less of their total electricity bill)
  - To support a minimally disruptive transition to the new rate design the AESO is exploring mitigation to reduce this impact to no more than a 10 per cent increase in transmission costs
- Many customers (including residential, commercial and industrial customers) can expect a reduction in transmission costs relative to today
  - Changes in bills for customers will depend on how distribution companies pass through transmission costs

*A customer's total electricity bill depends on transmission costs, energy price, and distribution costs (if applicable)

Bill impact methodology and assumptions

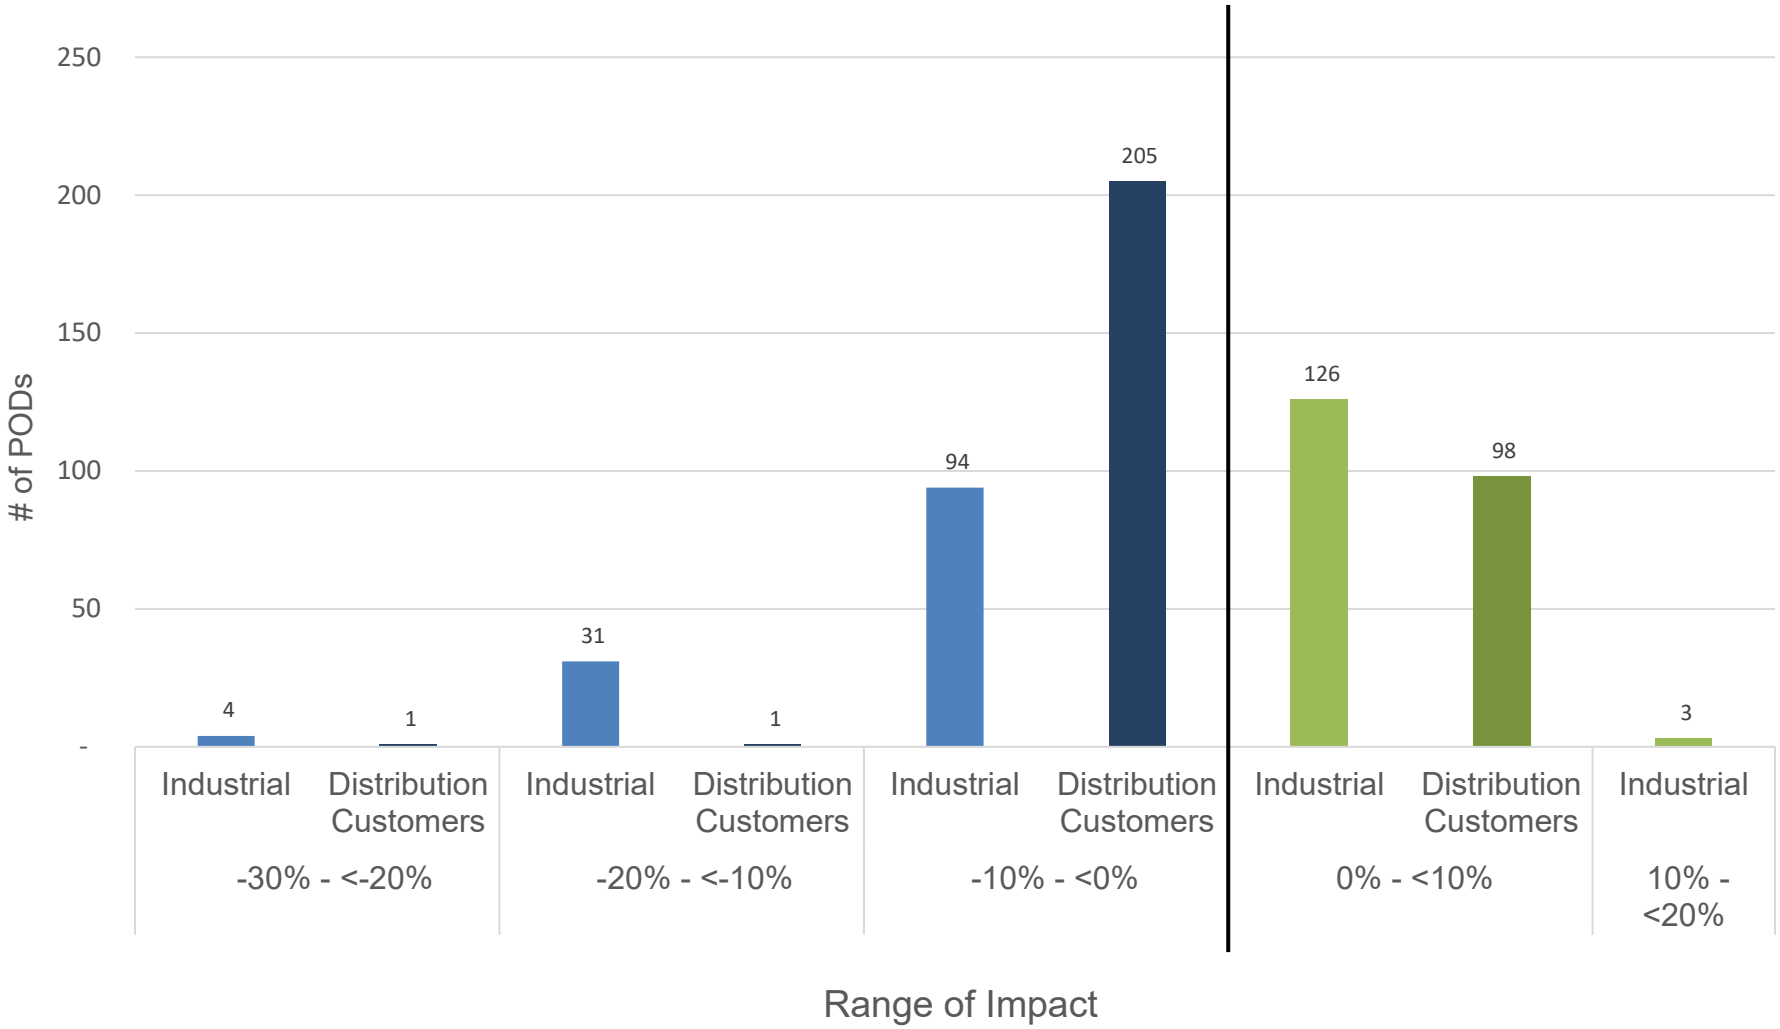
- Calculate the impact of changes in bills attributable to Rate DTS (Demand Transmission Service) changes
  - Proposed and current rates were applied to the same billing determinants (for the 2019 test year) at each **point-of-delivery** (POD) for the bulk and regional charges
    - Transmission bill for each POD includes POD costs, Operating Reserve (OR) charges and other tariff charges
    - Total bill for each POD includes transmission bill and energy commodity costs
  - Estimated per cent impact based on change in transmission costs and total bill by POD under current and proposed tariff
  - Assumed 12-CP consumption maintained at current levels (i.e., no retroactive averages)
- Bills for an individual Rate DTS point-of-delivery will be different from estimates depending on actual demand and usage at the point-of-delivery and actual effective rates

Number of PODs by transmission cost per cent impact (2019 test year)



Industrial: AESO and DFO Transmission connected customers

Number of PODs by total bill per cent impact (2019 test year)



Industrial: AESO and DFO Transmission connected customers

Estimated average transmission cost impact (by Load Factor, 2019)

Billing Capacity (MW)	Load Factor (energy use / capacity)				
	0-20%	20%-40%	~~20~~ 40%-60%	60%-80%	80%-100%
0-7.5	-12%	-1%	0%	2%	5%
7.5-15	-9%	-4%	1%	2%	5%
15-22.5	-11%	-2%	-1%	2%	5%
22.5-30	-13%	-4%	1%	2%	5%
30-37.5	-19%	-3%	-1%	4%	9%
37.5-45	-20%	—	-2%	3%	—
>45	-16%	5%	0%	2%	7%
Total Accounts	**95**	**66**	**170**	**204**	**28**

Estimated average total bill impact
(by Load Factor, 2019)

Billing Capacity (MW)	Load Factor (energy use / capacity)				
	0-20%	20%-40%	~~20~~ 40%-60%	60%-80%	80%-100%
0-7.5	-9%	-1%	0%	0%	1%
7.5-15	-7%	-3%	0%	0%	1%
15-22.5	-8%	-1%	-1%	0%	1%
22.5-30	-11%	-2%	0%	0%	1%
30-37.5	-13%	-2%	-1%	1%	2%
37.5-45	-17%	—	-1%	1%	—
>45	-13%	1%	-1%	0%	2%
Total Accounts	**95**	**66**	**170**	**204**	**28**

Estimated average transmission cost impact by coincident peak response

- Customers with low load factors are less likely to be consuming during coincident peaks
- Customers with higher load factors tend to consume during coincident peaks
- Customers with higher load factors and who respond to coincident peaks will have a larger rate impact under the AESO's preferred design **before mitigation**

Response to Coincident Peak (%)	**Load Factor** (energy use / capacity)		
	0-33%	33%-66%	66%-100%
0-33%	-12%	-2%	2%
33%-66%	-5%	2%	16%
66%-100%	-13%	22%	42%

Further information about bill impact

- The AESO has posted the Bill Impact Tool to allow stakeholders to calculate the estimated bill impact for their sites
  - Stakeholders can request from the AESO their specific site data input for the tool. The AESO will provide the data to the Rate DTS market participant for the site.
  - The AESO is hosting a **Technical Information Session on March 31, 2021** to provide further information on how to use the Bill Impact Tool. Registration details are available on our website.
- Ratepayers can also request a one-on-one meeting with the AESO to ask questions about how the Bill Impact Tool works for your site. These bill impact one-on-one meetings will be scheduled during April 1-14, 2021.
- **Email us at tariffdesign@aeso.ca** to request your site-specific data input for the Bill Impact Tool and/or to request your one-on-one bill impact meeting

Questions

Public

Path to Achieve Minimal Disruption

Public

Session 4 feedback on minimal disruption

- What we heard
  - Gradual implementation over time is preferrable given current economic circumstances
  - Mitigation options can only be evaluated alongside the AESO's preferred rate design
  - Mitigation of rate increases that occur at the bill level allows for quick adoption and allows tariff price signals to become effective
  - Mitigation at bill level is difficult to implement fairly, especially if permanent
  - Major changes to current tariff design are premature at this time
  - Changes to rates cannot be delayed indefinitely
- We are including a pathway to achieve minimal disruption that is targeted at those loads who will see a transmission cost impact of 10 per cent or more

What we mean by minimal disruption

- Minimal disruption means transitioning to the new tariff design in a way that balances two risks
  1. Continuation of current tariff incentives risks increasing the cost shifting between customers who can respond to incentives and those who cannot
  2. If the changes to the tariff design are so significant that some customers choose to leave the grid, costs to remaining customers would increase
- Preferred rate design addresses first risk in a manner that minimizes the second risk for many, with additional mitigation to support the few that are significantly impacted
- Path to change should allow customers to adapt to new tariff design
  - We have an opportunity to develop and put forward to the Commission a mutually acceptable mitigation approach that will allow for a successful transition to the new tariff design

Targeted engagement plan for mitigation

- Rate impact assessment indicates significant increases only to limited number of consumers
  - The Bill Impact Tool will assist all impacted stakeholders in assessing their rate impact to identify concerns to the AESO
- The AESO is initiating a targeted engagement to develop a mutually acceptable set of mitigation options with this small impacted group
- Agreed upon proposal, or identified options*, will be shared with the broad stakeholder group for Session 6
- The AESO will provide both information from the targeted engagement and the broad engagement to the AUC to support regulatory efficiency
- The AESO intends to include a mitigation proposal as part of its application for approval by the AUC
  - The AUC has ultimate authority to decide whether or not to approve the proposal or any identified option

* If unable to agree upon a proposal, options identified by involved parties will be shared

Scope of targeted mitigation

- Parties with an estimated transmission cost impact of greater than 10 per cent increase have been invited to this targeted engagement
  - Includes seven sites / customers across four industries
  - Total estimated impact of roughly $8 million
  - The five distribution facility owners (DFOs) PODs with an estimated transmission cost impact of greater than 10 per cent that are not DFO Transmission connected customers are excluded, as the rate impact is incorporated into overall DFO rates and will not be POD specific

AESO mitigation proposal starting principles

The AESO is seeking to develop a mutually acceptable mitigation proposal with the small group of impacted loads that will:

1. **Limit the rate impact for customers**: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition
2. **Adapt with design and rates**: Ensure options are adaptable to changes to the proposed design and forecast rates
3. **Consistent application**: Mitigation options can be applied consistently across all impacted loads and not be individually defined
4. **Administrative simplicity**: Feasible to implement with current tools and systems
5. **Mutually acceptable**: Account for feedback from broad stakeholder group

Mitigation options assessment

The AESO's initial evaluation of options forms a starting point for targeted mitigation engagement

- Other options may be identified by impacted loads in targeted engagement

Type	Category	Description	Assessment
Rate Design	Transition Rate Design	Phase in tariff changes	Given the small number of load customers with rate impacts over 10 per cent a phase-in of new rates not needed, targeted mitigation more effective
		Adjustment period	Limited effectiveness as a mitigation option as greater portion of rates based on usage and not billing capacity
	Rate Classes	Set rates by customer size/type/class	Preferred rate design provides customers with similar flexibility to today, better reflecting how differences in behavior correspond to transmission costs
Bill Adjustment	Transition bill impacts	Bill increase of no more than X% per year for Y years	Continues to be an available option for consideration in the targeted engagement
	Permanent bill reduction	Bill increase of no more than X%	Mitigation is to support a minimally disruptive transition to getting the appropriate long-term price signals in place.

Targeted approach – Schedule

- **March 19-31 |** One-on-one meetings with impacted loads
  - Describe estimated bill impact
  - Respond to questions on targeted engagement process
- **April 15 |** Stakeholder feedback due on mitigation options and proposal principles from broad stakeholder group
- **April 1 to late May |** Facilitated group meetings
  - Explore options, seek agreement
  - Notes from meetings will be shared (excluding commercially sensitive information)
- **Late May |** Outcomes of targeted engagement will be shared with broad stakeholder group for feedback
- **June |** Adjust mitigation proposal for feedback received from broad stakeholder group

Energy Storage Tariff Treatment

Public

Session 4 feedback on energy storage tariff treatment

- What we heard
  - Current rates reflect one class of service: firm load
  - Consideration should be given to rates that reflect the different types of uses of the system: non-firm rates
  - Types of tariff treatment that could reflect different use of the system:
    - Rates that allow additional use of available capability that would not otherwise occur
    - Rates that reflect transmission cost savings from interruptions to relieve constraints
    - Rates that encourage participation in markets or provision of ancillary services

Summary of non-firm rate assessment

	Rates that reflect transmission cost savings from interruptions to relieve constraints	Rates that encourage participation in markets or provision of ancillary services	Rates that allow additional use of available capability that would not otherwise occur
Description	• Demand reduction (or increase) beneficial to reduce transmission constraints, value of which is reflected in rates	• Reduced DTS rate available everywhere to eligible loads / storage that participate in markets or reliability services (energy, OR)	• Discount relative to DTS for curtailable service to enable use of the system that would not otherwise occur to offset costs for other customers
Rationale	• Identify need in specific location • Interrupt load to manage transmission constraints • Lower future transmission costs	• Available everywhere • Encourage participation in market / service through additional bids and offers	• Encourage efficient use of capability without incurring additional transmission costs (AESO can recall and load must curtail)
Conclusions	• Rates that reflect transmission cost savings from interruptions to relieve constraints have a strong locational component	• Rates that encourage participation in markets or provision of ancillary services do not impose different transmission costs than those that do not, and provision of services is compensated through those markets / contracts	• Rates that allow additional use of available capability that would not otherwise occur are beneficial for all stakeholders provided the use of this capability would truly not otherwise occur under Rate DTS

Rates that allow additional use of available capability

- The AESO has considered options to reflect different use cases of the grid and has identified that energy storage could make use of transmission capability that would not otherwise occur for benefit of other customers or drive the need for additional transmission capacity
- Demand Opportunity Service (DOS) is one such rate
  - Allows customers connected to the grid to draw additional power over and above the amount they are contracted for under DTS as a means of reducing DTS charges for all customers
  - The current service is interruptible, temporary and available only when there is surplus transmission capacity
    - Term is 12 months
    - Three types based on interrupt-ability: Seven-minute, One hour, Term
    - Loss charges are applied to MW under this rate
  - Participants need to pre-qualify for DOS

DOS rates refresher

Rate DOS Type	Cost Allocation to Rate DOS[1]	Opportunity Service Obligations
DOS 7 Minute	• Costs converted to $/MWh amounts • Variable components of the bulk and regional system (i.e., energy charge)	Recallable within 7 minutes of a directive
DOS 1 Hour	• Costs converted to $/MWh amounts • Variable components of the bulk and regional system (i.e., energy charge) • + 50% of the non-energy bulk and regional system charges	Recallable within 60 minutes of a directive
DOS Term (Available to loads with generation, when generation unavailable)	• Costs converted to $/MWh amounts • Variable components of the bulk and regional system (i.e., energy charge) • + 100% of the non-energy bulk system charges • +1200% of the non-energy regional system charges	Recallable within 7 minutes of a directive

[1]As filed in the AESO's 2010 ~~2020~~ ISO tariff application (paragraphs 229 - 233) and approved in Decision 2010-606, released on Dec. 22, 2010

Key terms and conditions for DOS

- Current DOS pre-qualification
  - Non-refundable $5000 fee (annual fee)
  - Requires anticipated frequency of use
  - Estimate of MWhs per month
- Eligibility criteria
  - Use would not occur under any other rate
  - Sufficient transmission capacity
  - Is temporary or repeated short-term use
  - Must have alternative energy source or a “market opportunity” where the cost of receiving additional electric energy under Rate DTS renders the opportunity uneconomic
- Transaction request
  - 45 days after pre-qualification
  - Prior to use the participant must submit a formal transaction request + $500/month if approved

Modernizing DOS

- The AESO's revised view is that the DOS rate may be revised to allow for expanded eligibility (i.e. energy storage)
  - Overall structure and rate design considerations can remain as is
  - Energy storage may be able to meet DOS eligibility criteria
- Must resolve outstanding questions regarding eligibility, visibility and use of energy under the DOS rate for greater use
  - How to validate that the energy would not have been used under a DTS rate?
    - Any adjustments to expand application need to maintain the balance of allowing customers to draw additional power that otherwise would not be used under Rate DTS, while eliminating any potential for customers to rely on DOS as a means of avoiding DTS charges
  - How to modernize the DOS transaction information so that the AESO has clarity on when energy will be used? And how it is curtailed?
    - Confirm what information is used or needed by the AESO relating to DOS energy and eliminate any unnecessary requirements

Next steps

- We are seeking feedback with respect to:
  - Is DOS a suitable rate for a portion of energy storage charging capacity?
  - And if so, your thoughts on assessing eligibility?
- AESO will continue to explore noted questions
  - AESO will present recommendation at Session 6

Questions

Public

Implementation Considerations

Public

Implementation considerations

- To support the transition, the AESO will provide a forecast of rates in advance of them coming into effect
- The AESO will reduce red tape through administrative changes to rate sheets
- Updates to underlying data and transparent information
  - The AESO will propose to update the data underlying the cost allocations every five years
    - Calculations underlying the demand and energy allocations
    - Calculations underlying the allocations of demand to bulk and regional categories
  - Timing of highest coincident metered demand to hourly from 15-minute interval
    - Provides participants with more transparent information
    - Simpler calculation aligns with public information
    - More appropriately reflects information used for transmission planning

Feedback requested on implementation changes to increase flexibility

- Should the AESO provide participants with more flexibility to contract capacity?
  - Contract reset period
    - Allow participants to change their contract capacity once new rates come into effect, without payment in lieu of notice (PILON), to better reflect their needs given the change in rate design
  - Expand PILON waiver provisions
    - Allow for changes to contract capacity without a PILON, provided the contract level has not changed in the previous five years
    - Encourage participants to provide more accurate information about contract level to the AESO by removing PILON under certain circumstances

Next Steps

Public

Engagement schedule

- **March 31, 2021 |** Host technical information session to go over Bill Impact Tool to ensure understanding and enable stakeholders to understand how to navigate and determine their bill impact
- **March to May 2021 |** Work with those customers that are expected to experience a transmission cost impact of 10 per cent or more through an approach of targeted mitigation engagement
- **April 1-14, 2021 |** Host bill impact one-on-one meetings with interested ratepayers to assist with using the Bill Impact Tool and ensure understanding on how the impact can be calculated
- **April 15, 2021 |** Stakeholder feedback due on questions set out in stakeholder comment matrix
- **Late May/Early June 2021 |** Host stakeholder engagement session to provide an overview and seek stakeholder input on mitigation discussion outcomes, energy storage assessment recommendation, Session 5 stakeholder feedback or follow-up, and areas of alignment
- **June 2021 |** File application with AUC for public proceeding and approval

Session feedback

- We want to thank you for attending the Bulk and Regional Tariff Design Stakeholder Engagement Session 5 and we would appreciate your feedback on the session
- To limit stakeholder fatigue, we are collecting your initial feedback on the session by conducting a Zoom poll during the session rather than emailing you a short session survey following the session
- Zoom poll

Session feedback (cont.)

- We value stakeholder feedback, and we invite all interested stakeholders to provide their input on this session via the questions set out in the **Stakeholder Comment Matrix Tariff Session 5 on or before April 15, 2021**. The matrix will be available on March 25, 2021 on our website at www.aeso.ca.
  - Path: Stakeholder Engagement > Rules, standards and tariff consultations > Tariff (filter) > Bulk and Regional Tariff Design > March 25, 2021 Session 5
- Within this comment matrix we are looking for your feedback on the following:
  - Preferred rate design
  - DOS rate eligibility
  - Targeted approach on mitigation discussions
  - AESO mitigation principles and options
  - Areas of alignment
  - Implementation considerations

Next session

- The next session (Session 6) will be hosted in late May or early June 2021. Notice will be provided three weeks in advance in our Stakeholder Newsletter and on our website.
- Session 6 purpose
  - The purpose of the session is to engage stakeholders in a discussion of the AESO's mitigation discussion outcomes, energy storage assessment recommendation, Session 5 stakeholder feedback or follow-up, and areas of alignment
- Session 6 objectives
  - Provide an overview and seek stakeholder input on the outcomes of the targeted mitigation engagement
  - Present and discuss the energy storage assessment recommendation for the purpose of getting stakeholder feedback
  - Share our learnings and seek stakeholder input on Session 5 stakeholder feedback or follow-up and areas of alignment
  - Understand outstanding stakeholder concerns

Appendix

Public

Tariff design alternatives considered and dismissed

1) Approach to allocating between demand and facilitating the free flow of in-merit energy:

a) Generation capacity compared to contractual demand

Rejected: Does not account for differences in transmission costs that arise from how load and in merit energy use the transmission system at different times

a) Peak net generation compared to peak load

Rejected: Does not account for diversity amongst customers, nor does it account for the fact that transmission is needed to accommodate in merit energy even if load is there to offset.

2) Functionalization of demand-driven costs:

a) Functionalizing based on length or capacity of transmission wires

Rejected: no systematic correspondence between length or capacity and function

3) Consideration of time period for billing determinants for bulk costs to coincident demand:

a) 1CP and 4 CP:

Rejected: if selected, would not capture other times in the year where marginal in merit energy and demand are in different places.

b) 12-CP (in its current form):

Rejected: average is more reflective of how longer- term consumption patterns drive transmission costs

List of Acronyms

Public

Acronyms

- AUC = Alberta Utilities Commission
- CP = Coincident Peak
- DFO = Distribution Facility Owner

- POD = Point-of-Delivery

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Company Representative
Comments From:	Company Name			**Phone:**	Contact Phone Number
Date:	[yyyy/mm/dd]			**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	

12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	
15	Do you have any additional implementation considerations the AESO should consider?	
16	Do you have additional clarifying questions that need to be answered to support your understanding?	
17	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Individual Site Bill Impact Tool

This bill impact tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document[1] in effect, the authoritative document governs.

1 Purpose

This bill impact tool is intended to allow ratepayers to assess historical annual impact with respect to the AESO's preferred bulk and regional tariff rate design ("Preferred Rate Design") described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 published on March 18, 2021 and presented in the corresponding AESO's Stakeholder Session 5 on March 25, 2021.

The purpose of this bill impact tool is to allow a market participant to estimate the annual historical charges for system access service under the AESO's Preferred Rate Design, including Rate DTS, *Demand Transmission Service* , and Rate PSC, *Primary Service Credit* .

The calculations in this bill impact tool provide estimated charges under the Preferred Rate Design only. The AESO calculates certain actual charges on an hourly basis rather than on average annual amounts, and ***actual charges under any future tariff design may differ from the estimated amounts presented in this bill impact tool*** .

2 Current Design and Preferred Rate Design Rate Calculations

Current Design (Test Year 2019) and Preferred Rate Design (Test Year Future) rates are calculated using actual 2019 billing detemrinants for all sites and 2019 revenue requirement. The rates only differ by changing the functionalizaiton and classification from current approved in the 2021 ISO tariff to the preferred rate design.

3 Completing the Individual Site Bill Impact Tool

This section describes how a market participant may complete the bill impact tool to estimate and compare annual charges (based on historical load information) for system access service under the existing 2021 ISO Tariff bulk and regional tariff design and under the AESO's Preferred Rate Design.

Initial Steps

Paste single site annual billing determinants on cell "A2" of the 'Site Data Input' tab.
This summary data can be provided by the AESO (in coordination with the DFO if necessary)

In the Technical Information Session on March 31, 2021, the AESO will provide examples and a detailed walk through of the bill impact tool.

The information included in the 'Site Data Input' tab will allow calculations on the 'Annual Summary' tab and will provide annual summary of bill impact resulting from the preferred rate design.

Adjusting Input Data

The 'Adjust Load Profile' tab provides the opportunity to override historical load profile or billing determinant information.

For assistance with this tool and Site Data Input data, please contact the AESO at: tariffdesign@aeso.ca

Attachments

Annual Summary - Summary of bill impact by year

Individual Site Bill Impact Tool

This bill impact tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document[1] in effect, the authoritative document governs.

1 Purpose

This bill impact tool is intended to allow ratepayers to assess historical annual impact with respect to the AESO's preferred bulk and regional tariff rate design ("Preferred Rate Design") described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 published on March 18, 2021 and presented in the corresponding AESO's Stakeholder Session 5 on March 25, 2021.

The purpose of this bill impact tool is to allow a market participant to estimate the annual historical charges for system access service under the AESO's Preferred Rate Design, including Rate DTS, *Demand Transmission Service*, and Rate PSC, *Primary Service Credit*.

The calculations in this bill impact tool provide estimated charges under the Preferred Rate Design only. The AESO calculates certain actual charges on an hourly basis rather than on average annual amounts, and ***actual charges under any future tariff design may differ from the estimated amounts presented in this bill impact tool***.

2 Current Design and Preferred Rate Design Rate Calculations

Current Design (Test Year 2019) and Preferred Rate Design (Test Year Future) rates are calculated using actual 2019 billing detemrinants for all sites and 2019 revenue requirement. The rates only differ by changing the functionalizaiton and classification from current approved in the 2021 ISO tariff to the preferred rate design.

3 Completing the Individual Site Bill Impact Tool

This section describes how a market participant may complete the bill impact tool to estimate and compare annual charges (based on historical load information) for system access service under the existing 2021 ISO Tariff bulk and regional tariff design and under the AESO's Preferred Rate Design.

Initial Steps

Paste single site annual billing determinants on cell "A2" of the 'Site Data Input' tab.
This summary data can be provided by the AESO (in coordination with the DFO if necessary)

In the Technical Information Session on March 31, 2021, the AESO will provide examples and a detailed walk through of the bill impact tool.

The information included in the 'Site Data Input' tab will allow calculations on the 'Annual Summary' tab and will provide annual summary of bill impact resulting from the preferred rate design.

Adjusting Input Data

The 'Adjust Load Profile' tab provides the opportunity to override historical load profile or billing determinant information.

For assistance with this tool and Site Data Input data, please contact the AESO at: tariffdesign@aeso.ca

Annual Summary - Summary of bill impact by year
Adjust Load Profile - Allow ratepayers to override input values to assess impact
Site Data Input - Tab to allow annual billing or load profile information by year

Revision History

Date	Description
2021-03-18	v 0.1 - Initial release with draft Test Year 2019 values
2021-03-22	v 0.2 - Fixed to work with all Excel versions and Contract Capacity to pull appropriate year selected (not just 2019)
2021-03-30	v 0.3 - Fixed to ensure adjusted load profile data aligned with results from 'Adjust Load Profile' data
2021-04-06	v 0.4 - Fixed to pull actual annual average pool price into 'Adjust Load Profile' tab

[1] "Authoritative document" is the general name given by the AESO to categories of documents made by the AESO under the authority of the *Electric Utilities Act* and associated regulations, and that contain binding legal requirements for either market participants or the AESO, or both. Authoritative documents include: the ISO rules, the reliability standards and the ISO tariff.

To: AESO Stakeholders

Re: Alberta Utilities Commission Questions to the AESO with Respect to the Preferred Bulk and Regional Tariff Rate Design

On April 7, 2021, following Session 5, the AESO received the attached correspondence and list of questions from Alberta Utilities Commission staff ("the AUC staff questions") regarding the preferred Bulk and Regional Tariff rate design. The AESO appreciates the opportunity to consider the AUC staff questions as part of its stakeholder engagement and is of the view that this will bring efficiencies to the overall regulatory process.

The AESO is in the process of reviewing the AUC staff questions and determining how it will respond, and whether it will respond in an upcoming stakeholder session, in its Application or through another forum.

Yours truly,

Nicole LeBlanc
Director, Markets & Tariff

AUC
Alberta Utilities Commission

April 7, 2021

Alberta Electric System Operator
Calgary Place
2500, 330 Fifth Avenue S.W.
Calgary, Alta. T2P 0L4

Dear Nicole LeBlanc:

AUC staff questions regarding the preferred Bulk and Regional Tariff design

1. Alberta Utilities Commission staff offer the following questions in order to provide the Alberta Electric System Operator (AESO) with an opportunity to consider them and, if it chooses, to address them either directly or in its anticipated Bulk and Regional Tariff application. They did not originate from, and have not been vetted or endorsed by, Commission members. They are not information requests.

2. The questions are generally premised on the preambles that precede them. The preambles also do not reflect the Commission's views. Challenges to the preambles, including providing alternative perspectives, are invited.

3. AUC staff's intention in providing these questions is to support regulatory efficiency by, to the extent it is able to, identifying in advance those issues and aspects of the proposed design that it feels may arise during the anticipated tariff proceeding.

4. Should you have any questions, please contact the undersigned at 403-592-4435 or by email at carl.fuchshuber@auc.ab.ca.

Yours truly,

Carl Fuchshuber
Director, Regulatory Strategy

Attachment

1. Design Objectives

Preamble:
The AESO stated that its design objectives include:[1]

- Cost Responsibility:
  - Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid (Decision 22942-D02-2019)
- Efficient Price Signals: Price signal to alter behavior to avoid future transmission build
- Minimal Disruption: Customers that have responded to the 12 coincident peak (CP) price signal and invested to reduce transmission costs are minimally disrupted

Regarding its preferred rate design, the AESO stated:[2]

- Reflect Cost Responsibility
  - Resulting rates reflect costs of using the transmission system, including costs associated with in-merit flow of energy, local and peak use of the system
- Efficient Price Signals
  - Resulting rates provide transparent price signals to customers that better reflect the cost drivers of the transmission system

Additionally, the Distribution System Inquiry report commented on distribution rate design,[3] in paragraph 315, as follows:

> In summary, the four experts agreed at a conceptual level that distribution rate design should involve both (i) non-avoidable charges to recover the embedded costs of the existing infrastructure; and (ii) variable, avoidable charges to send a forward-looking price signal capable of affecting future system costs by altering current behaviour. In tandem, these two components incent customers to make economically efficient decisions in their consumption of electricity (including the choice between electricity drawn from the grid and self-supplied).

Questions:

1.1 Please provide the AESO's position on whether the features of non-avoidable and avoidable charges identified above also apply to transmission rate design. Why or why not?

1.2 Of the bulk and regional charges in the current Rate Demand Transmission Service (Rate DTS) rate design and in the preferred rate design, please explain which charges the AESO considers are non-avoidable and which charges the AESO considers to be avoidable.

---

[1] Bulk and Regional Tariff Design, Stakeholder Engagement Session 5, March 25, 2021, Slide 17.
[2] Bulk and Regional Tariff Design, Stakeholder Engagement Session 5, March 25, 2021, Slide 45.
[3] Distribution System Inquiry, Final Report, Proceeding 24116, February 19, 2021. An outline of how charges may be referred-to as avoidable or non-avoidable can be found in sections 3.2 and 3.3.

1.3 Based on the response to 1.2 above, of the current bulk and regional charges, what per cent of the current and preferred bulk and regional transmission system is recovered via non-avoidable charges and what per cent of the system is recovered via avoidable charges?

1.4 Please explain how the AESO developed its definition of efficient price signals as set out in Slide 17. Please reconcile this definition with the statements made on Slide 45 regarding the preferred rate design, and comment on whether they are aligned. Does the last sentence of the quoted paragraph from the Distribution System Inquiry report align with the AESO's definition of efficient price signals?

1.5 The AESO determined that a marginal approach does not meet its rate design objectives based on five reasons. These reasons included that: efficient price signals would need to vary by location; and recovering a significant portion of residual costs would undermine the price signal's efficiency.[4]

(a) In the AESO's view, in the absence of being able to send locational price signals for transmission, is there no value in sending any marginal price signals to all Rate DTS customers as a postage stamp rate via the Rate DTS bulk and regional rate design?

(b) Has the AESO performed any analysis that could inform splitting bulk and regional costs into marginal and residual components? If so, please provide the results.

(c) Does the AESO have an analysis of what percentage of residual costs in its preferred rate design are to be recovered via avoidable versus non-avoidable charges?

(d) Please explain the statement that "… recovering [a] significant portion of residual costs would undermine [the] efficiency of [the] price signal"[5] in more detail.

1.6 Cost responsibility and cost causation principles:

(a) Please describe how the AESO defines cost responsibility.

(b) Please provide the paragraph numbers or sections relied on in Slide 17 describing cost responsibility in Decision 22942-D02-2019.[6]

(c) How does cost responsibility pertain to the recovery of existing (sunk) costs?

(d) Please describe how the AESO defines cost causation.

(e) How does cost causation pertain to the recovery of existing (sunk) costs?

(f) Please explain the rationale for recovering demand-classified transmission facilities via billing capacity, versus recovering demand-classified transmission facilities via a 12 CP (or other CP) mechanism.

---

4 Bulk and Regional Tariff Design, Stakeholder Engagement Session 5, March 25, 2021, Slide 31.
5 Bulk and Regional Tariff Design, Stakeholder Engagement Session 5, March 25, 2021, Slide 31.
6 Decision 22942-D02-2019: Alberta Electric System Operator, 2018 ISO Tariff Application, Proceeding 22942, September 22, 2019.

1.7 Please explain whether minimal disruption[7] is intended to apply to the rate of cost change or to the overall magnitude of cost change over time, or both.

2. Breakdown of Bulk and Regional Transmission Costs

Preamble:
The AESO provided a spreadsheet showing transmission costs by project for the period 2006-2037, [8] which also identified the driver(s) of each project. AUC staff seek to further understand the drivers of system transmission projects and how they may relate to billing determinants.

Questions:
2.1 For each project listed in the spreadsheet, please identify:

(a) whether it is/would be functionalized as bulk, regional, or both. If both, please identify the approximate percentage of the total project costs relating to bulk system assets, and regional system assets;

(b) whether it is/would be classified as system-related or participant-related, or both. If both, please identify the approximate percentage of the total project costs classified as system-related and participant-related;

(c) for projects where the driver is ambiguous or mixed (e.g., Load / Generation), please provide a percentage allocation to each of load and generation, based on the AESO's best judgement.

2.2 Please generally comment on how the current and proposed incentives produced by the tariff may affect future costs. Please discuss what limitations, if any, restrict the effectiveness of the incentive (e.g., lack of locationality).

2.3 In the bulk and regional rate design, how should the ratio of avoidable to non-avoidable charges ideally be determined in order to strike a balance between using the existing transmission facilities versus building additional transmission? Under what circumstances would it be efficient to build additional transmission facilities?

3. Preferred Design

Preamble:
The AESO's preferred rate design relies on an embedded approach, with modifications intended to better reflect cost causation.

Questions:
3.1 Please identify how the AESO's preferred rate design might change in the absence of its objective of minimizing disruption to 12 CP responders, or its concerns about the current economic climate.

---

[7] Bulk and Regional Tariff Design, Stakeholder Engagement Session 5, March 25, 2021, Slide 31.
[8] Drivers and Costs – Historical and 2017 LTP System Projects, Consultation Session 1, posted March 9, 2020.

3.2 In the AESO's preferred rate design, bulk system costs are recovered using billing determinants that appear to be avoidable, e.g., by five-year average 12 CP demand and total energy consumption. Does the AESO anticipate that bulk system costs will be substantially fixed in the near to mid-term? If so, please explain why it is appropriate to recover all bulk system costs through avoidable charges.

3.3 In the AESO's preferred rate design, regional system costs are recovered using billing determinants that appear to be both non-avoidable and avoidable, e.g., by billing capacity and total energy consumption. Does the AESO anticipate that regional system costs will be substantially fixed in the near to mid-term? If so, please explain why it is appropriate to recover regional system costs with a combination of avoidable and non-avoidable charges.

3.4 The preferred rate design has retained the functionalization of bulk and regional portions of the transmission system based on operating voltage.

(a) Please explain why the AESO considers the functionalization of the transmission system should continue to be broken into bulk and regional systems.

(b) Does the AESO consider that voltage (as used in the 2018 transmission cost causation study update[9]) remains a meaningful characteristic that functionalizes the transmission system in Alberta into bulk and regional systems?

(c) In the AESO's experience, is 240 kilovolt transmission used (and/or increasingly being used) to serve a regional transmission function?

3.5 The preferred rate design appears to utilize readings of peak regional demand and peak regional generation to calculate the portion of bulk and regional costs to be allocated to energy, which is recovered through an all hours energy charge.

(a) Please explain why an all hours energy charge is appropriate for recovering costs which were determined based on readings at single instances in time.

(b) Please discuss whether average readings of area loads and generation would be a better allocator of bulk and regional costs to energy as compared to peak readings.

3.6 Please provide a more detailed explanation of the calculations completed in the step of "Minimum and actual systems for Alberta are estimated as the sum of the minimum and actual systems across all planning areas."[10] For example, did the AESO determine the actual (or current costs) for the transmission system in each planning region?

3.7 In the preferred rate design, the classification between demand-related and energy-related costs is completed before functionalizing between bulk and regional costs. Has the AESO assessed whether it would be appropriate to define new functional categories to replace (or augment) the existing bulk and regional categories to better align with the preferred rate design? If new functional categories were determined, would it be possible for the functionalization step to precede the classification step, as typically done to design rates? Please explain.

3.8 Is the number of points of delivery (PODs) a driver of regional transmission costs? For example, is there a relationship between the number of PODs in a region and regional

---

[9] Exhibit 22942-X0025, Appendix D - Transmission System Cost Causation Study 2018 Update, page 12.

[10] Bulk and Regional Tariff Design, Stakeholder Engagement Session 5, March 25, 2021, Slide 39.

transmission costs? How would regional transmission costs change if load within each region remained the same, but there was only one POD in each region that served the region's load? Based on the response, would it be appropriate to recover some portion of regional costs through a fixed per POD charge that is invariant to any metered quantities? Why or why not?

3.9 For the year 2019, please provide the total energy usage of all end-use customers on the interconnected electric system that either receive system access service through Rate DTS (because they are a direct customer of the AESO) or receive a flow through of the Rate DTS rate structure through their distribution facility owner (DFO) (such as FortisAlberta Inc.'s Rate 65).

3.10 If all users of the electric system (such as all DFO customers) were interval metered, and received a flow through of all the elements of the AESO tariff, please explain whether the AESO considers that the preferred rate design would still meet its rate design objectives of cost responsibility, efficient price signals, minimal disruption, simplicity, innovation and flexibility.[11] If not, please explain what modifications the AESO would propose to the preferred rate design to make it appropriate. Do any elements of the preferred rate design become inappropriate if substantially more customers have an incentive and the ability to respond to the price signals?

4. Load Growth

Preamble:
To better explore the relationship between historical load growth and transmission system costs, it may be useful to review historical forecasts of load growth and actual load growth. Additionally, a common dataset and consistent terminology may benefit all parties. Terms below in **bold** are referenced from the AESO's Consolidated Authoritative Document Glossary, and are presented in a paraphrased manner. If the data requested below is not readily available, please consider providing it in support of the future application.

Questions:
4.1 Please provide hourly load data from 2010 to 2020 in the categories identified in the included Excel spreadsheet. The questions below refer to the spreadsheet. Please note that Row 2 has been included in the Excel spreadsheet as an example of the AUC staff's understanding. Please provide any clarifications in how the mechanisms work or can be reconciled.

(a) These questions relate to "**system load,**" which is the total, in an hour, of all metered demands under Rate DTS, Rate FTS and Rate DOS of the ISO tariff, plus transmission system losses.

[11] Bulk and Regional Tariff Design, Stakeholder Engagement Session 5, March 25, 2021, Slide 45.

(i) Is the "coincident peak **metered demand**" (e.g., in Rate DTS) measured as the maximum of "**system load,**" the sum of Rate DTS and Rate FTS alone, or other? Please explain.

(ii) AUC staff understand that the "coincident peak" is currently measured in a 15-minute interval, and not in a 60-minute interval. In the included Excel spreadsheet, please indicate the hours in which the monthly coincident peak would have occurred if measured on a 60-minute interval (column M). Please also indicate the hours in which the 15-minute CP demand that was used for billing purposes occurred (column N).

(b) These questions relate to "**Alberta internal load**" (AIL) which represents, in an hour, "**system load**" plus load served by on-site generating units, including those within an industrial system and the City of Medicine Hat, which the AESO, using SCADA[12] data calculates as the sum of each generating unit and aggregated generating facility in Alberta and the Fort Nelson area in British Columbia, plus import volumes minus export volumes.

(i) Please provide an example of how, in calculating AIL, the AESO accounts for the load at a single site with on-site load being served by on-site generation, such as for an industrial system. Is the AESO able to determine the portion of the site's total internal load which is being served by on-site generation and if so, how? (e.g., using SCADA data and revenue meter readings.)

(ii) Please provide an hourly column of the aggregate internal load that is masked by on-site generation (column I in the attached Excel spreadsheet). This would include the portion of internal load at self-supply and export sites, sites with industrial system designations, Fort Nelson, and Medicine Hat, that is supplied by on-site generation and thus not metered under Rate DTS.

(iii) Please provide an example of how in calculating AIL, the AESO adjusts for the output of distribution-connected generation, and any load on distribution systems it may mask.

(iv) Please provide an hourly column of the aggregated internal load that is masked by distribution connected generation (column J in the attached Excel spreadsheet).

(c) For each column in the attached Excel spreadsheet, please explain where this information is publicly available, if at all. (e.g. "system load" is published as part of PSM Charge summary, Rate FTS is the public asset identifier "BCH" on energy trading system, transmission system losses are the public asset code "ABLL" on energy trading system, etc.)

(d) The AESO makes public various reports referring to total load and/or "**system load,**" such as on the energy trading system report "payments to suppliers on the

[12] SCADA: Supervisory control and data acquisition.

margin" or PSM Charge summary,[13] the operating reserve charge supplement[14] as well as through public data requests.[15] In reviewing these reports, the results for total load or "**system load**" do not match across the various reports. Please explain why that would be the case.

(e) Are there other types of load not accounted for, either in "**system load**" or "**Alberta Internal Load**"? If so, what are they? (e.g. sites with on-site load for which SCADA data does not exist, distribution-connected generation that is less than 5 megawatts (MW), micro-generating units, etc.)

(f) Currently, not all load on distribution systems may be metered under Rate DTS because of distribution-connected generation. However, when the adjusted metering practice is triggered at a substation, the amount of load being masked by DCG may decrease. As a result, "**system load**" may increase, with a commensurate decrease to the term mentioned in (b)(iv) above (column J of the attached Excel spreadsheet). Does the AESO intend on tracking these changes in order to differentiate changes in load from changes in metering configuration which result from the adjusted metering practice?

(g) With respect to transmission planning conducted by the AESO:

(i) Does the AESO plan the future of the transmission system based on "**system load,**" "**Alberta Internal Load**" or other?

(ii) How would a potential industrial system with 100 MW of on-site generation, 60 MW of on-site load, but only 30 MW of contracted DTS capacity, be incorporated into the AESO's forecasts and planning?

4.2 Please provide annual data from 2006 to 2020 in the following categories. If the sum of the Excel column C for "Rate DTS" in hourly detail from the Excel spreadsheet above does not match the annual "Metered Energy (All Hours)" for any given year in the table provided below, please explain the discrepancy.

Rate DTS Billing Determinant	**Units**	**2020 Recorded**	**2020 Forecast**	**2019 Recorded**	**2019 Forecast**	…
Coincident metered demand	MW-months					
Total Billing Capacity	MW-months					
Total Contracted Capacity	MW-months					
Highest Metered Demand	MW-months					
Metered Energy (All Hours)	GWh

5. 12 CP Demand as a Driver of Bulk and Regional Transmission Costs

Preamble:
The AESO presented data suggesting a weak correlation between line loading and demand levels,[16] as well as an illustration of historical peak line utilization which also suggested a weak correlation between CP periods and peak line loading.[17]

Questions:

5.1 Various consumer groups have stated that there may be up to 400 MW of demand response or price responsive load on the system. Is it possible to simulate system conditions that would have occurred during a representative subset of the historical CP conditions[18] if CP responsive load did not respond to the CP? If so, please provide.

5.2 Has the AESO performed any analyses that might inform an assessment of the relative risk of transmission system failure during monthly CP load periods compared to during all other periods? If not, can the AESO comment on what it might expect from such an analysis? If not, would the AESO be willing to perform such an analysis?

5.3 The graph on Slide 35[19] shows the total flows on bulk lines experiencing usage greater than 90 per cent of their annual peak. For some lines, it may be the case that a line's peak usage may not be near the line's maximum loading capability. Additionally, lines with relatively high load factors may experience loading that is within 90 per cent of their annual peak during many periods in a year. Is there an alternative indicator that the AESO could compute that may more accurately quantify the stresses being experienced by the transmission system at different times? If so, please provide.

5.4 Please comment on the feasibility and appropriateness of implementing a time-of-use tariff component designed to recover the marginal portion of bulk and regional transmission costs in a manner that might correspond more closely to the correlation between system load and transmission line loading indicated in the AESO's analysis.

5.5 Please comment on the feasibility and appropriateness of implementing a tariff component (such as an energy charge) with a dynamic rate, where the rate fluctuates in real time based on the loading of transmission facilities relative to their maximum capabilities. Could this type of tariff component provide a price signal that is more effective at reducing future

[16] For example, Load to Power Flow Correlation Summary Charts - 2018, Consultation Session 1.

transmission cost than the other tariff components considered by the AESO? Please explain.

6. Storage

Preamble:
The AESO has proposed that a modernized demand opportunity service rate (Rate DOS) with expanded eligibility might be suitable for providing service to energy storage customers so that they could make use of transmission capability that would not otherwise occur and contribute to recovering its cost without driving the need for additional transmission capacity. The AESO has also identified that a use of Rate DOS is to allow customers with their own generation to avoid curtailing load when their generation is unavailable without affecting their DTS billing capacity.

Questions:

6.1 How does the AESO reflect low load factor consumers (such as customers that normally self-supply) in its planning studies?

6.2 If the AESO were to plan the bulk and regional transmission system to accommodate energy storage users, how would it include them in its planning studies?

6.3 Does the AESO have a definition of what a standby or interruptible rate would be? How would the definition of standby or interruptible service rate differ from an opportunity service rate?

6.4 Does the AESO have an analysis of locations where the installed capacity may be higher than the contracted capacity at various substations?

Bulk and Regional Tariff Design Stakeholder Engagement Session 5 hosted on March 25, 2021

I. Purpose and objectives of the session

The purpose of this session is to present and discuss the AESO's preferred rate design. The session objectives include:

- Present preferred rate design, including energy storage treatment, to stakeholders
- Present and discuss path to achieving minimal disruption
- Present bill impact summary and assumptions
- Provide Bill Impact Tool
- Begin to discuss implementation considerations

II. Session agenda

Time	Agenda Item	Presenter
8:00 – 8:10	Welcome, introduction, purpose, and session objectives	AESO / Stack'd
8:10 – 8:30	Opening Remarks • Case for change • Key highlights	AESO
8:30 – 8:50	What we heard • Cost Responsibility • Efficient Price Signals • Embedded and Marginal Approaches	AESO
8:50 – 10:30	Methodology and Analysis • Summary of rate design • Review and elimination of marginal approach • Improvement to embedded approach	AESO / NERA
10:30 – 11:00	Break	
11:00 – 12:30	What we heard, methodology and analysis • Q&A	AESO / NERA
12:30 – 1:00	Break	
1:00 – 1:45	Bill Impact Summary • Summary • Methodology and assumptions • Impacts • Bill Impact Tool • Q&A	AESO

Public

IV. Overall outcomes from the day

The main objective of the session was for the AESO to present its preferred rate design and to give stakeholders the opportunity to respond to the AESO's design. Participants engaged in meaningful discussion and overall, stakeholders agreed that this was a valuable session that allowed them to share their perspectives and feedback.

V. Session highlights

Captured below are the highlights of the questions and discussion on a topic-by-topic basis. For a detailed review of the session, please refer to the session recording, posted at www.aeso.ca.

Topic 1: Improvements to the embedded approach

i. Stakeholder commentary

- Clarifying comments:
  - *ADC:* The data on Slide 35 (Bulk transmission system use) may not be as accurate in the absence of the data of customers responding to 12-CP. The price signal caused a response on the system and, had the price signal not been there, the chart would have looked different.
  - *IPCAA:* Perhaps I am misunderstanding the graph on Slide 35, is it saying that the flows appear to be around 6,000 MW on a transmission system built for 15,000 MW?
  - *IPCAA:* Do other jurisdictions switch the classification / functionalization order? Which other jurisdictions in North America use energy as an allocator for bulk transmission?
- Discussion of 12-CP as compared to the improved embedded approach:
  - *AltaLink:* Are you taking into consideration the benefits in the cost causation study?
  - *AltaLink:* If you're looking at the planning, in the hours that line flows aren't correlated to the coincident peak, is the generation flowing to meet a local load? How does your analysis address the fact that the critical use of transmission is driven by specific local supply and load conditions not hourly energy?

Public

- *TC Energy:* If 12-CP does not perfectly correspond to peak bulk line utilization, could you please explain why the solution is not to adjust 12-CP so that it better corresponds to peak utilization, but rather to shift such a large percentage of costs to energy?
- *ERCO Worldwide:* Rather than using energy as an allocator wouldn't it make more sense to expand the CP intervals instead? BC Hydro uses 30-minute demand peaks.

ii. AESO / NERA clarification

- Response to clarifying comments:
  - Need to keep in mind that the graph on Slide 35 is only showing the bulk line flows, it is not showing the entire system.
  - The key point is that even if there were higher levels of flows on transmission lines as a result of customers not responding, that wouldn't change the fact that there is still a great deal of highly utilized transmission lines at times that aren't coinciding with the 12-CP hours. The point here is not to show 12-CP doesn't matter; we're saying that even though 12-CP and peaks and demand remain important, there are other factors and that the design should reflect these other factors to best meet cost causation.
  - We are not seeking to emulate what other jurisdictions are doing, that is not the main objective. We are trying to come up with a proposed design that is appropriate and that reflects the features and context of the power system in Alberta.
- Response to questions regarding the improvements to the embedded approach:
  - The AESO recognizes that the transmission system needs to be built to meet peaks in demand. We also want to reflect that in order to meet demand at different times in the year, the AESO needs to plan a different set of transmission lines to meet different sources of peaks of demand. The positioning and nature of these lines needs to consider where the generation sources are. It is not just peaks in demand that are causing the AESO to have to plan additional lines, it also includes the need to relieve congestion and facilitate the flow of energy.

Topic 2: Methodology and analysis

i. Stakeholder commentary

- Clarifying questions:
  - *DePal Consulting:* Referencing Slide 39 (Minimum and actual system calculation), is what you're doing taking the peak load from each region? As we add more renewables in the system, the generation capacity will increase and there will be more and more costs. Will these costs be allocated to energy?
  - *NextEra:* Are you measuring the peak load and peak generation at the same time? And are the measurements on a gross or net basis?
  - *Capital Power:* Self-generating customers who are connected to the grid have access to the market as well so they have option to draw from their own supply or the market. Are the self-supply sites covering their fair share of costs?
  - *DePal Consulting:* Referencing slide 42 (Billing determinants to reflect cost causation), what does phasing in of the five-year trailing average mean?

Public

- *ADC:* Don't see how the price signals result in lower transmission costs for consumers?
- *AUC:* Are there any other forums that are ongoing right now or is this the only venue by which stakeholder groups/customers are currently engaging?

- Many participants were concerned with the data and methodology of the AESO's analysis:
  - *DUC:* The *Electric Utilities Act* says you should not distinguish between geography, so why does the AESO have 42 areas?
  - *Alberta Newsprint:* these arbitrary 42 areas were not divided for this tariff's purposes and these areas are getting different treatment.
  - *Solas Energy:* Referencing Slide 35, the two years of data used are 2017-2018. Has the AESO looked at the utilization and power flows in 2019-2020 and what is more representative of how we go forward?
  - *Lafarge:* How did we land on the five-year lookback? A five-year lookback with so much change – is it still relevant to be looking back at it?
  - *ADC:* Every tariff design will result in consumer response. What has the AESO done to complete analysis what the potential unintended consequences of what this rate design are?
  - *ADC:* If we're making a major change to the tariff design, there needs to be better empirical evidence that the off-peak hours and incentives to using the system during off peak hours. Will the AESO be making a detailed cost analysis supporting the tariff design available for stakeholders for review?

- Some participants questioned the AESO's proposed rate design:
  - *Suncor:* Transmission is all about congestion elimination. Is the AESO suggesting that energy used in all hours regardless of congestion is relevant as a transmission cost or transmission build driver? Or are we looking at certain hours as still way more important than others? Should some energy attract higher rates than others?
  - *ASCENT:* Referencing Slide 39, it appears that the more aligned the locations of generation and load are, the less allocation will go to energy and the more to peak demand. Is this intentional to reflect the lower infrastructure needed when generation locates close to load?
    - *ASCENT:* If generation is free to locate where it chooses but load pays for the system, how do you propose to close the feedback loop so that interests are aligned to minimize system cost?
    - *AltaLink:* Concerned about the preferred design from economic efficiency perspective. Given the postage stamp rate structure, 12-CP signals may incent responses in certain regions that may result in an increase in the need and cost for new transmission.
  - *ADC:* If the AESO is assuming every hour contributes equally to congestion, are all hours created equal? Do we perceive a response away from the current optimization based on these incentives?
    - *Alberta Newsprint:* How do we justify the large increase from $2 to $10? Is this method robust enough or is it just what suits us on what we think at a high level?

Public

- *Alberta Newsprint:* Most jurisdictions have moved to reduce their peak demand loads, but why is the AESO proposing the same charge during the day and night? All other provinces are incenting increasing nighttime load to decrease daytime peak load but here, the $10 energy charge does the opposite.
- *ASCENT:* The rate design is sound, but we still don't have a mechanism with which to make decisions in the future to minimize system costs. If generation can locate anywhere at once, the costs to transport the energy is not being reflected on the generators. How do we close this feedback loop?

- Some participants were concerned with the risk of incentivized grid defection:
  - *CCA:* Concerned with price signals coming out of significant energy classification, especially for residential customers. What kind of signal would that give to self-generators in terms of load defection?
    - *CCA:* The energy charge is a blunt instrument and it's going to the wrong people. Generation is causing these costs, not load. Generators could be incented to be located in more favorable locations rather than the blunt price signal which will only incent more grid defection.
    - *ADC:* How does this design provide the incentive for colocation and the impact that can have on the future of the grid?

ii. AESO / NERA clarification

- Response to clarifying questions:
  - Referencing Slide 39, we're comparing peak demand and peak generation in 42 areas and using it as a proxy for the size of the transmission systems and we're adding those altogether. This calculation is based on energy not on capacity. It depends on which area it's going to locate in, it's difficult to say that more renewable capacity would necessarily change the allocation.
    - We are measuring the peak load and peak generation at different times on a net basis.
  - When we're thinking about a customer's self-supply, that has a role in the overall cost and a portion of that is appropriately reflected in the other charges that they pay. Some of the connection value to the grid is also assessed in the point-of-delivery (POD) costs and regional billing capacity-based costs.
  - "Phasing in": the AESO wants to allow these rates to take effect and be based on the signals in place at the time. This could motivate customers to make changes earlier in the five years.
  - Regarding how price signals result in lower transmission costs for consumers, this rate design better aligns with the cost causation principles, which should lead to a more effective outcome.
  - Regarding other forums for discussion, this is the only broad stakeholder engagement activities that we're running regarding the Bulk and Regional tariff design.
- Response to questions regarding methodology and analysis:

Public

- In regard to the use of a specific line, we know that congestion will arise in specific times, but we're trying to abstract from any particular one set of conditions and think about it in a broader context.
- The methodology we've set out is reflecting the fact that in order to meet peak demand, a certain amount of transmission cost needs to be incurred. Beyond the systematic seasonal differences in demand and supply, we don't really see any clear evidence, nor are we likely to see systemic patterns, therefore we went with the flat charge.
- Regarding the 42 areas, this is a methodology in which we're using granular information about the transmission system to come up with something that applies across the province.
- Regarding the 2017-2018 data used for the chart in Slide 35, the flows across the transmission lines are high at times other than just the 12CP, which is the extent of the conclusion that we're drawing from this chart. Would not expect this overarching conclusion to change if we were to repeat the analysis with different years. We have shown that the tariff design that is proposed is designed to account for differing demand and supply patterns, the design intended to keep up with those changes.
- The rationale for the five-year period is that this better aligns with the process the AESO uses to plan the system. It is based on an average across a number of years because the average over time is more reflective of the information used in the course of the planning process.
- In terms of cost analysis, we have released information of cost and bill impact of the proposed tariff rate design. We've shared as much analysis today that stakeholders need to understand the design, can follow up with specific data requests at a later time.

- Response to questions regarding the AESO's proposed rate design:
  - Within the context we're operating in there's a certain framework for transmission planning and transmission cost recovery. This rate design methodology is designed to reflect how the transmission system is actually used to the extent we can. We're working within that framework to develop a methodology that reflects our specific context.
    - We're aggregating all this information from all areas to come up with a single calculation. No area is being treated differently. The costs are paid by load because they're the beneficiaries of transmission. The allocation of costs in the bulk and regional tariff is not able to send signals to generators to locate in certain areas in our framework.
  - Different areas feature differently in the calculation, but that allows us to capture that some parts of the transmission system are sized to support the flow of energy from them and some parts are sized to support load in those areas. It is necessary to ensure a cost reflective tariff that information about the size of different areas is included in the calculation to meet cost causation principles.
  - Regarding congestion – the occurrence of congestion is rare due to how the AESO manages the system. The allocation to energy is really capturing that there are parts of the transmission system that are planned and specified because it's unpredictable when congestion will take place (i.e., we can't predict when a windy day will take place).

Public

- The allocation of energy is to cover the additional transmission costs that are unrelated to peak periods. We haven't seen any clear evidence of patterns of transmission utilization that the energy charge should be different at different times of day.

  - The AESO wants to clarify that what over the course of this engagement started with establishing bookends that reflect a range of possibilities. We received a lot of feedback from stakeholders about the bookends and heard different proposals and throughout that time, we've been refining our thinking and analysis to come up with a methodology that's appropriate. We do recognize this will have an impact on customers and we think that that impact deserves more attention, and we have a process to achieve that.

- Response to stakeholder concern about the risk of grid defection:
  - When we look at the resulting charges, it's true that a portion of the costs are allocated to the energy component and that creates an opportunity for customers to respond to manage their costs. We're not at this point seeing an energy charge that's so significant that it would lead to grid defection from customers.

Topic 3: Bill impact summary

i. Stakeholder commentary

- Clarifying comments:
  - *IPCAA:* Fortis is preparing a calculator to help customers understand distribution rates, would ATCO do the same thing? Encourage the AESO to approach customers to develop these.
  - *ADC:* Slide 54 (Estimated average transmission cost impact by load factor, 2019) shows the cost impacts as a percentage of bill – why isn't this same slide shown as a dollar impact? Can the AESO comment on the dollar impact on the 80-100 per cent?
  - *CCA:* We are seeing more and more distributed energy being added to the system at the area level which could result in a higher energy allocation. The energy billing determinants could potentially go down as there is more distributed energy resources (DER) being added and net metered generation. Wondering if the AESO could provide a forecast of energy billing determinants for the next five years with the new energy charge and without the new energy charge?
  - *Solas Energy:* What sectors are being hit more on a dollar basis – can the AESO provide the dollar amount?
  - *UCA:* Will the AESO conduct a price response study and modify the bill impact analysis to reflect this dynamic?
  - *Solas Energy:* If the majority of PODs by total bill have a lower amount, how is AESO covering all of the cost? Is this mostly at the residential level?
  - *Weyerhaeuser:* Have you considered the Department of Energy review of the recommendation on the status of self-supply and export policy in your tariff considerations?
- Discussion of perceived "penalization" of high load factor customers:
  - *IPCAA:* Concerned that we're penalizing the folks who are using energy more efficiently.

Public

- *DePal Consulting:* It's not surprising that not all load customers will benefit but seems strange that that's the outcome we want – to decrease the charges to low load customers to 20 per cent and increase them to high load factor customers. Why is this outcome acceptable to the AESO?
- *Alberta Newsprint:* The table on Slide 54 shows the opposite of if you use more, you have to pay less, this is not settling well.
- *EPCOR:* Was there any consideration to shift costs from the CP charge to the capacity charge rather than to an energy charge? That way high load factor customers may not be impacted as much.

ii. AESO clarification

- Response to clarifying comments:
  - Regarding Slide 54, the dollar values do matter, but because they tell a slightly more nuanced story, we didn't provide that dollar information to not confuse the story. An average is only going to tell you so much information – we're relying on the Bill Impact Tool to give the relevant dollar impact information.
  - The information the AESO has put together today is a starting point. Regarding how customers will respond to this in the future, the one thing to keep in mind is the size of the energy billing determinant in relation to other billing determinants is larger.
  - It's important to not lose sight of the fact that along with change in the rate design, we're also shifting and reducing the 12-CP charge. We can't just look at the change in the energy charge in isolation, we need to look at the full mix of the rate design.
  - Regarding the request for a price response study, the AESO is unlikely to perform this type of analysis.
  - In response to how the AESO is covering all costs if the majority of PODs have a lower amount: the AESO collects the entirety of the revenue requirement and the percentage changes are a function of the averaging and the data is presented as a percentage range.
- Response to perceived "penalization" of high load factor customers:
  - The AESO is thinking about this from the basis of the transmission system as a whole and developing rates that are more reflective of cost behavior drivers over the longer time. The resulting rates are expected to better reflect how the use of the system is related to cost. Customers are savvy and will respond to these changes. If you are connected to the grid, you are paying the fixed cost of connection and once you are using the grid, the appropriate allocation is to reflect how that use drives future transmission costs. We think we're achieving this through principles of cost causation and the outcomes are manageable and going to set us forward on the right path for the future.
  - The AESO has reviewed the impacts that result from this rate design, and looking across the whole range of impacts, we see it as being an acceptably sized impact.
  - The AESO has looked at several different alternatives within the current legislative framework and we are moving forward with the one we think is the most cost reflective.

Public

Topic 4: Path to achieve minimal disruption

i. Stakeholder commentary

- Clarifying comments:
  - *Dow Chemical*: Is the transition measured in months, years, or decades?
  - *ADC:* Has the AESO done any research on the economic job impacts for those customers who will be largely impacted?
  - *Solas Consulting*: There is discussion about having one-on-one conversations with load to customize what their billings may be. Should this be transparent and consistent between loads? If you are deferring charges, who picks up the bill?
  - *IPCAA:* There is a concern here that we're talking a low end of a $30M cost shift and $8M of mitigation. We don't have information from the government, and we seem to be spending a lot of administrative dollars and mitigation dollars to get to a very small change in terms of mitigation. Is it worth it? There's a worry that we're not being fair to the customers who are being impacted the most here.

ii. AESO clarification

- Response to clarifying comments:
  - The transition measurement is something the AESO wants to explore with the impacted customers – it's an open discussion.
  - The AESO has not done any analysis on the economic or job impacts for high-impact customers.
  - The AESO is looking to get feedback from the broader group before we finalize the process to achieve minimal disruption.
  - The materials for conversation around the case for change were provided in December. It comes down to the fact that we do think it's important to get the right signals in place. If we wait and make the change later, that impact will be even bigger.

Topic 5: Energy Storage treatment

i. Stakeholder commentary

- Clarifying comments:
  - *Chapman Ventures:* Referencing Slide 72 (Rates that allow additional use of available capability), are there differing thoughts on treatment of market participation classification of hybrid renewables plus storage?
  - *RMP Energy Storage:* Storage is most likely going to look like a generation unit– still a competitive issue here that needs to be resolved. DOS right now you can only get for the 12 months you've applied – do we need to reapply every year? Other than price, the issue that we've had with DOS historically has been that we're building a 30+ year asset. How can you

Public

have the uncertainty on one of your largest cost on a year-to-year basis? Having to renew every 12 months adds additional uncertainty.

- *TransAlta:* There are situations when an energy storage asset is providing a service where they could be forced into an over-frequency event. In the case of an energy storage asset, they may need to actually consume off the grid which would be a very high cost. How might this be able to be modified?
- *AUC:* Has DOS ever been curtailed?
- *Heartland Generation:* We're discussing the energy storage rate as part of the B&R rate. Would it be easier to do it in a more targeted fashion (i.e., a separate forum)? If there isn't necessarily a discussed linkage, is the AESO contemplating a parallel process that can be discussed in a separate forum than the B&R?
- *Solas Energy:* What happens in the future if there's additional load and less room on the additional line – is there any protection for the energy storage?
- *Suncor:* The AESO doesn't want people to sign up for DOS if they would otherwise sign up for Demand Transmission Service (DTS). This perspective is unnecessarily and inappropriately restrictive. Just because it's economic to use rate DTS, doesn't mean it is desirable from a grid perspective or a societal perspective for someone to sign up for DTS.

- Discussion of DOS modernization:
  - *Power Advisory:* Do you also think there are going to be changes to DOS as well as you modernize?
  - *Power Advisory:* You wouldn't see storage using only DOS, there would still be some DTS component of storage and DOS would sit on top?
  - *Solas Energy*: Investor confidence is low as they are seeing DOS as a very big risk. There is insufficient certainty of any investor in energy storage and there would need to be significant changes to include more certainty both for time frame for interrupt-ability as well as the term. When the AESO can choose to curtail you at any moment is not something that would make the project financeable – need a limitation or a curtailment on that in order for it to work.
  - *DePal Consulting:* I do think the DOS rate could work for storage. What needs to be modified is the take-per-pay charges – the variable energy charge is a good way to go. When designing this rate, how do we study it? Is it going to be curtailable? Good start but needs substantial redesign.
  - *Capital Power:* Has the AESO evaluated how their tariff proposal will impact overall DOS rates? Is there an estimate on what they may look like should the proposal be approved? With DOS modernization, are we at a blue-sky exercise of what DOS could look like in the future?
  - *RMP Energy Storage:* How does this then work through the interconnection process and determining capacity availability if it's under a modernized DOS rate?
  - *CCA:* Could you please explain how the criterion, that DOS must meet a temporary economic opportunity, is applied in practice?

Public

ii. AESO clarification

- Response to clarifying comments:
  - The DOS rate itself would typically sit above the DTS rate and when this application is applied to the grid. One of the key components of DOS is that this is energy that would otherwise go unused under DTS.
  - In terms of re-application every year, the AESO wants to look at the criteria in the effort of modernizing DOS and making it a better and more usable rate for customers. We want to hear where the sticky points are with DOS from stakeholders to alleviate the uncertainty.
  - DOS has been curtailed historically.
  - In response to discussing energy storage as a separate topic from the Bulk and Regional Tariff Design: Because there's a tight component that DOS doesn't decrease demand on DTS, there's some desire to keep the topics together, but it is something to consider.
- Response to DOS commentary:
  - The AESO is not changing the spirit of DOS, but at the same time, a lot of the issues of DOS are around the eligibility of the mechanisms and processes that customers and the AESO needs to access that energy. The AESO wants to make it more effective.
  - More than likely, all storage facilities have some minimum charging capacity that we would need to meet, there would at least be some level of DTS.
  - There's nothing firm about DOS, if there's available capability and you pass the eligibility criteria, then DOS is provided as an opportunity service.
  - The AESO realizes that there is risk in an over-frequency event. That will be factored into our future design in one way or another, but that work is yet to be done.
  - There's a lot of history in DOS rates, but the AESO needs more feedback on how to calculate the DOS rates. The principles of DOS must stay the same. We don't want to re-envision DOS; we want to modernize and hone in on the eligibility question and the transactional components.
  - As an opportunity service, DOS can be curtailed in the short-term period. The question is, in the longer term, how frequently does this need to happen? Is it every 12 months?
  - The eligibility for DOS is a very case-by-case and it's based on each individual application to the AESO.

Topic 6: Implementation considerations

i. Stakeholder commentary

- Clarifying comments:
  - *NextEra Insights:* The AESO is moving from 15 minutes to hourly while we've seen a lot of jurisdictions moving to sub-hourly settlements (e.g. 10 minutes or 5 minutes). I would have thought the AESO would want to go in this direction. Has there been a study or discussion that we wouldn't have to switch back to 10 minutes or 5 minutes in the future?

Public

- *Alberta Newsprint:* Is the highest meter demand hourly or 15 minutes?
- *AUC*: If the coincident peak is based on system demand, system demand isn't a normal report that can be pulled up. Does the AESO have any plans to make that data more available so people can do their own analysis and we can make these better distinctions?
- *ADC:* We would agree that the Payment in Lieu of Notice (PILON) should be implemented and not even wait for the tariff. There are many out there billing on contract capacity – we should let them know and get this right-sized as soon as possible.

ii. AESO clarification

- Response to clarifying comments:
  - In response to the change to hourly, what the AESO is really looking for is consistency – it's not a big cost change to be consistent today in the new tariff.
  - In response to the request for data, the meter volumes report is a bit closer to what stakeholders may be looking for. We agree the data should be out there to help people understand.

Public

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Colette Chekerda
Comments From:	Alberta Direct Connect “ADC”			**Phone:**	780-920-9399
Date:	2021/04/15			**Email**:	colette@carmal.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments

1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable, but based on the significant change in direction of the bulk and regional tariff proposal, the AESO should have been prepared with more details and supporting evidence. Specifically: 1. Supporting evidence that 31% of Alberta's bulk and regional costs were incurred to support in-merit energy flows. The CTI projects were built to minimize land use impact and for future growth. The AESO needs to provide evidence that the costs incurred for these projects are consumption based. The AESO must publish the peak flows on the CTI lines relative to the design parameters so that Albertans understand how the investment in transmission is being used. Further, the AESO must specifically examine the Heartland line. It was designed for 500 kV operation and has only ever been operated at 240 kV. A minimum system approach would consider the system that Alberta needs to support our energy market and peak load and compare that to the system we have built. The difference then can be examined for cost responsibility and tariff treatment. 2. An energy-related allocation of transmission costs is inefficient because it gives equal weight to all hours of the year, even late night and early morning hours of the day when the loading of transmission lines is typically at its lowest. The AESO has not demonstrated that specific transmission lines have been constructed in Alberta to alleviate congestion in order to support in-merit energy flows. In particular, no evidence has been presented to demonstrate that bulk transmission lines have been constructed specifically to alleviate congestion in off-peak hours in order to facilitate in-merit energy flows. Absent such evidence, there is no factual basis to support an energy-based allocation of fixed transmission costs. 3. The minimum system approach that the AESO has employed to identify demand-related transmission costs is unorthodox. Minimum system analyses are typically used in the context of functionalizing a portion of distribution wires costs as customer-related, not demand-related. Fixed, sunk transmission investments are demand-related costs that vary with increases in peak demand and are not related to connecting customers to the system. The AESO's minimum system approach is a significant departure from accepted allocation methods for transmission costs that have been employed

		by Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs) in the U.S. 4. The coincident peak (CP) demand allocation method is the standard allocation method for network transmission costs approved by the Federal Energy Regulatory Commission (FERC). The FERC's pro-forma Open Access Transmission Tariff (OATT) applies a 12CP allocation method for network transmission costs, and the 12CP method is the established allocation method for bulk transmission costs that is predominantly employed by RTOs and ISOs in the U.S. to allocate transmission costs. The Electric Reliability Council of Texas (ERCOT) region relies on a 4CP allocation method for transmission costs. Even where bulk transmission costs are allocated to RTO/ISO sub-regions using other methods such as production cost simulations to determine the distribution of project benefits within the RTO/ISO region, the project costs are predominantly allocated to bulk transmission customers using a load ratio share demand allocation that is based on customer demands at the time of the peak. Energy-related allocation of transmission costs are unorthodox and are not widely used. Therefore, the AESO's proposed tariff design in fundamentally inconsistent with the transmission cost allocation methods that are generally employed by RTOs and ISOs in the U.S. 5. The AESO has acknowledged that they have completed no analysis on the long term tariff change implications to Alberta's economy. This rate significantly increases costs of Alberta's most electricity intensive and trade exposed industrial facilities. ADC members alone are facing over $10M in annual transmission cost increases as a result of the AESO proposal. Alberta Industry will respond to this price signal in three ways: (i) further cost cutting measures such as job losses or shutdowns of high cost facilities; (ii) move production and future expansion plans to other jurisdictions where power prices and electricity policy are more favorable and stable; or (iii) defect from the Alberta grid and self supply, including completely defecting from the grid if Alberta's self supply and export policy limits companies' ability to manage electricity costs. All three of these responses will result in the exact outcome that the

		AESO proposes is the driver for this redesign – allocation of costs to a shrinking base of rate-payers. 6. The explanation for the 5 year 12 CP was confusing and it still isn't clear what the supporting evidence is for this change. Historically, the 24 month ratchet was unusually long, in fact twice as long as compared to other jurisdictions such as BC, Saskatchewan and Manitoba. Under current terms and conditions, the AESO requires 5 year notice to changes in DTS capacity. Having the 12 CP ratchet also be 5 years is not providing any better information for planning than what already exists with the notice requirements. This appears to be an unnecessary complication. 7. The AESO had over two years to study the Bulk and Regional costs. It is concerning that after that period of time, the AESO has not produced any fully developed cost causation study to support the proposed design. This should have accompanied the presentation. The AESO's rate design proposal relies on an inadequately supported assertion that 31% of Alberta's bulk system transmission costs have been incurred to facilitate in-merit energy flows and are energy-related. The AESO has not provided an analysis of system power flows or an analysis of the drivers for specific transmission investments to support this assertion. Moreover, the AESO has not provided an updated cost of service study to demonstrate how underlying system conditions and operating characteristics have changed in a manner that would support an increase in the energy-related percentage of the bulk transmission cost allocation from 7% under current rates to 31%. The AESO should identify what it believes has changed on the bulk transmission system since the last cost of service study approved by the AUC that would justify the proposed change in rate design, and it should provide an updated cost of service study that reflects any new cost drivers for system transmission additions that it claims to have identified. Further, the AESO is in a unique position to bring forward legislative recommendations to the Government to implement in the upcoming review of the transmission regulation that would provide for a real cost responsibility discussion.

2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	This was helpful. The AESO needed to have the tariff parameters based on 2020 and the 2021 revenue requirement as well as an updated cost projection model.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	The ADC is **not** supportive of the AESO tariff design. The move to energy allocation is not reflective of the sunk nature of the transmission system costs and penalizes the high load factor and price responsive customers which are the most efficient users of the transmission system. Transmission costs are fixed costs that do not vary with changes in energy consumption. Therefore, energy-related allocation methods for transmission costs are fundamentally inconsistent with the fixed, sunk nature of transmission investment. The size of the bulk transmission system, as well as the magnitude and timing of transmission system additions, are primarily driven by system peak demand patterns that are reflective of congestion on the system, which congestion primarily occurs during the peak hours. An energy allocation of transmission costs inappropriately gives equal weight to all hours of the day and the year and fails to properly focus the price signal on the peak demand hours that are most likely to exhibit transmission congestion and drive the need for system additions. The beneficiaries of the AESO's proposed rate design are low load factor customers who use the system inefficiently. Many of these low load factor customers have individual customer peaks that closely correlate to the system peak, particularly residential heating/cooling loads. However, their energy usage drops off dramatically after the peak hours. By contrast, high load factor customers whose costs would increase under the AESO's proposal consume a significant proportion of their energy during off-peak hours when transmission congestion is unlikely to be a concern. A rate design that rewards low load factor usage and penalizes price responsive, high load factor usage is inefficient and will discourage efficient use of available transmission capacity during off-peak periods.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	a) No. The notion that the transmission system is designed for in-merit energy with an energy cost element that is the same in each hour does not reflect cost responsibility. If the AESO can provide evidence that 40% of system costs are energy related and for in-merit energy, then the recommendation should have been that these costs be allocated to in-merit generation and then flowed through pool price offers when those generators are running. This will create a shaped price that is reflective of when generators are using the grid. b) Yes, the tariff proposal is signaling that Alberta does not value high load factor or flexible loads and that those companies should find alternatives to grid usage. c) No, this proposal is extremely disruptive to the seven sites identified for mitigation as well as the 28 sites identified as high load factor customers. For the seven sites, a permanent mitigation plan is required otherwise these sites will run to failure. For the other 28 high load factor sites, a change to the proposal is necessary. d) No, the 5 year 12 CP look back is unnecessarily complex and doesn't provide any better planning information than the current notice requirement. e) No, Alberta's energy intensive industrial sites have extensively pursued energy efficiency projects, demand response projects, and have participated in AESO programs such as operating reserves and LSSI. These sites have used every lever available to them to try to reduce power costs. They are simply running out of alternatives to remain competitive in Alberta outside of grid defection.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	The AESO should include the impact to Alberta's competitiveness as part of the rate design objectives. The only way Alberta solves the overbuilt Alberta Grid problem is to grow our way out of it. This will only happen if industry invests in Alberta and brings jobs and growth with it. ADC submits that the proposed rate will disincent investment in Alberta and thus have an opposite impact.. In a perfect world, the AESO would resolve the tariff matter with a thoughtful engagement with policy makers to inform legislative changes with a goal of making Alberta and attractive place to invest and grow business.

6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	The ADC view is that the tariff proposal was rushed, ignored prior consultation and has no supporting study shared with loads to support the new direction.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	The AESO has used a look back approach to determine rate impacts based on response to the current tariff. Different price signals, specifically a lower CP charge and the 5 year CP averaging will alter the response and the rate impact. The AESO should have provided a forward looking model that starts with the 2021 revenue requirement and forecasts the tariff out for the next 10 years including sensitivities for DTS load growth or reduction. This would allow customers to model the impact of response to new signals and the resulting impact to their business and productivity. This modelling would inform the rate design and provide tariff outlooks in various load growth scenarios.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Yes, the ADC is supportive of the AESO modernizing the DOS tariff. The ADC offers no perspective on the suitability of DOS on energy storage.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	In particular, minimum billed energy usage should be eliminated as it makes DOS very expensive as an insurance product for exceeding DTS levels during planned outages.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	ADC's concern with the approach is that there may be other similar loads as the ones targeted for mitigation that didn't get screened in the AESO analysis. The preferred mitigation is to provide a rate alternative to interruptible loads that is not exclusive to the seven sites in question.

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	A 10% increase in transmission costs to the seven sites will impact the commercial viability of these operations. This puts jobs, investment, tax base, and community support at risk, and has second order impacts to other dependent industries. In the end, the 10% increase also puts at risk the existing revenue contributed under the current tariff. These companies have invested millions of dollars in demand response to remain competitive in their respective industries. They sacrifice production daily to respond to pool prices and respond to coincident peak demand. They also put their load at risk to support Alberta grid reliability in operating reserves and under frequency response. They are essentially a 400 MW generator that shows up when the Alberta grid is stressed. They are energy intensive and trade exposed and can't flow through the cost increase to their customers. The narrative that they don't pay "their fair share" is frankly offensive. These customers raised competitiveness concerns a decade ago when Bill 50 was enacted. They told elected officials and the AESO that they couldn't afford the CTI projects being legislated and advocated for a less expensive solution. They do not understand how shifting millions of dollars to these customers (as well as the other high load factor customers) for an unnoticable decrease in residential and commercial transmission costs is going to magically make everyone happy about a $2.4B and climbing annual revenue requirement. A rate reduction for all could be achieved by tackling the hard topics of cost containment, transmission regulation, and returns on equity for regulated monopoly utiltiies.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	Ideally the rate works for everyone, without mitigation and the industry focuses on reducing the overall transmission system costs. Anything temporary signals a run to failure path forward to these industries.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Impacted members will participate in the process.

14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Yes, the ADC recommends an opportunity for all customers to right size their DTS contract capacity. In particular, those without section 101 waivers that are behind a distribution DTS contract should also have the opportunity to contract directly with the AESO or have line of sight and visibility of their DTS contract obligations. Yes, the ADC agrees and supports that any sites who have been in operation for a minimum period of time be exempt from the PILON.
15	Do you have any additional implementation considerations the AESO should consider?	The AESO should formally request a delay for filing the tariff proposal until all of the issues raised have been addressed.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	The ADC posed a number of questions in the session, many articulated in the above comments. The ADC would appreciate a formal response to our concerns.
17	Additional comments	None

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Surendra Singh
Comments From:	Alberta Newsprint			**Phone:**	780-778-1537
Date:	2021/04/13			**Email**:	surendras@albertanewsprint.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was helpful to know the details of the AESO preferred DTS rate design. As with most of the earlier sessions on this topic, the session lacked detailed analysis in support of your preferred rate design. It was a complete surprise to see what the AESO is now proposing as their "preferred design" compared to their direction a few months ago. Again this preferred design is not supported with any credible analysis. It is very concerning to say the least.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, the session was useful. Thank you for providing "Bill –Impact Assessment Tool". It would have been useful to provide a forecast of future costs to see the real impact going forward.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	No. ANC is not supportive of AESO's preferred rate design. First, the AESO has not provided the data supported evidence that demonstrates a need to change the current rate design. Second, the proposed rate design is also not based on thorough analysis and the AESO has failed to share with the stakeholders

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	We don't think that the AESO's preferred rate design meets their rate design objectives a) Reflect Cost Responsibility The current rate design is based on cost causation while AESO's preferred rate design is moving away from this core objective. Lowering the cost of transmission to those who use power during system peak with low load factor is in direct opposition to the principal of cost causation. b) Efficient Price Signals Again, the current rate design has a price signal to avoid, minimize and defer future transmission infrastructure. The AESO's preferred rate design is diluting that signal by a) lowering the co-incident peak charge and b) by increasing the charge of energy irrespective of time-of-day usage. Many facilities like ours have spent millions of dollars in capital projects to improve plant flexibility and train staff to respond to time-of-day usage signals to manage both energy and transmission costs. Time-of-day usage signals have been employed all over the world to minimize the need for both generation and transmission. c) Minimal Disruption Having the transmission cost increase over 50% for large industrial consumers is not a minimal disruption. By mitigating these increases to 10% for a limited period does not achieve the objective of minimal disruption. For highly energy-intensive industrial consumers like ourselves, a 10% increase has a material impact straight off our bottom line. A 50% increase after the end of the mitigation period will be devastating. d) Simplicity The AESO's preferred rate design is no simpler than the current design since it is retaining all the charges. In fact, it is introducing more complexity by using a 5 year rolling average of co-incident peak charges. e) Innovation and Flexibility The preferred rate design is moving away from innovation and flexibility. A simple example is the fixed charges on energy irrespective of the time of use. Flexibility will be maintained by having higher charges during peak hours to encourage industrial consumers to reduce their energy usage during the peak.

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	There are a number of things that the AESO can do: a) Do not reduce the charges for monthly CP b) Do not implement a 5 year rolling average of CP charges c) Do not charge the same rate for energy, irrespective of time-of-day usage
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	The assumptions and methodology used by AESO for dividing bulk system charges in to demand and energy based on load and generation profiles of various planning regions (40+ regions with artificial boundaries) is very concerning. This methodology is not sound at all, as one will get different results if these imaginary boundaries are shifted/moved. AESO preferred rate design is based on this very flawed assumption. This also confirms that the AESO has not done a thorough job of analyzing cost causation and that's why they are coming up with totally different rate designs every time they present their latest design.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	ANC is available to discuss alternatives with the AESO

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	Please refer to our response to #13
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	The proposed mitigation options, on a temporary basis, will not work as it will just delay the eventual full rate impact which will be devastating to electricity-intensive industrials, like ANC.

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	The preferred mitigation would be to continue with the current rate design, which is based on cost causation principles. Whenever you stray from cost causation, future users of the electricity grid will have to deal with the undesirable behaviour that results. Electricity intensity needs to always be considered when contemplating mitigation, since a 10% increase to a consumer whose electricity input costs are 5% of their total input costs, may be negligible. However, a 10% increase to a consumer whose electricity input costs are 50% of their total input costs, signals a financial disaster – especially considering your proposal to add 10% each year for 5 years. It is unreasonable to expect an electrically intensive industrial to be able to absorb that level of cost increase in a trade exposed industry where the price is set in a worldwide market. More practical mitigation measures are to continue to present material rate design elements that allow an electricity intensive industrial consumer to manage their flexible load in a mutually beneficial fashion – such as an interruptible rate. Socializing the cost of electricity excludes electricity intensive industrials from locating or even remaining in the Province of Alberta.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	We are in support of the AESO's proposal for more flexibility to adjust contract capacity and waive PILON.
15	Do you have any additional implementation considerations the AESO should consider?	We are in favour of cost causation as being the driver behind rate design, so that users of the electricity grid remain incented to design and implement facilities that minimize costs. This principle should never be abandoned no matter how overbuilt the current system may appear, since desirable characteristics of industrial consumers require significant investment and cannot be changed in a short period of time, if at all, once non cost-causal pricing signals have been ingrained.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	A change of this magnitude should only be driven by the outcome of a cost-causation study. Where is that study? Where is the analysis that is compelling the AESO to socialize so much of the transmission tariff – at the expense and possible removal of the electricity intensive industrial consumers?

17	Additional comments	The AESO should not proceed with its preferred rate design for a number of reasons; • During this pandemic, the main focus should be on managing our businesses. It is not the time to take resources/time from our main business of making goods and keeping Albertans employed. • AESO has not done/shared any study/analysis to justify the need to change the current tariff design. • AESO assumptions/analysis for their proposed design does not meet the level of study needed for such a major change. At minimum, a cost causation study needs to be undertaken. • AESO have not done any study of the impact of their proposed design change on the Alberta economy/jobs and its competiveness.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Hao Liu/Rob Senko
Comments From:	AltaLink			**Phone:**	(403) 710-1247/(403) 874-6762
Date:	[2021/04/15]			**Email**:	Hao.liu@altalink.ca / Rob.senko@altalink.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was useful because the AESO and their consultant presented their preferred rate design.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was useful because the AESO provided some clarification on the mechanics of the proposed rate design.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	AltaLink is not supportive of the AESO's preferred rate design. The proposed rate design will not stop the increase in bypass of transmission costs or the existing cost shifting that has been occurring under the AESO's current rate structure. AltaLink supports a principled rate design approach that reflects both costs and benefits of the transmission system. Tariffs should be fair, equitable and minimize inter-customer cost shifting. A principled rate design will seek to balance fair recovery of fixed transmission costs with price signals that encourage efficient use of the existing system without incenting inefficient behaviour. Current transmission rates have led to strong customer response to avoid coincident peaks, but have not brought about reduced transmission costs – a situation recognized by the AESO in their previous presentations to stakeholders. The energy charge in the proposed rate design is similarly inefficient. The proposed rate structure will encourage development of otherwise uneconomic behind the fence generation that will shift transmission costs to other customers. AltaLink believes the value of being connected to the grid should be reflected in the AESO's rate design so that all connected load pays a fair share of costs. A fair and equitable rate design should recognize that transmission costs are fixed and should be recovered in that fashion.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	Please refer to AltaLink's response to question 3 above.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	Please refer to AltaLink's response to question 3 above.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	Please refer to AltaLink's response to question 3 above.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	Please refer to AltaLink's response to question 3 above.

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	AltaLink supports the use of a Demand Opportunity Service as a means of increasing use of the transmission system.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	No comment.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	Please refer to AltaLink's response to question 13 below.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	Please refer to AltaLink's response to question 13 below.

12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	Please refer to AltaLink's response to question 13 below.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	AltaLink supports rate mitigation that results in a just and fair transition to new rates. Customers who made investments under current rates must be treated fairly.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Please refer to AltaLink's response to question 3 above.
15	Do you have any additional implementation considerations the AESO should consider?	No.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	No.
17	Additional comments	None.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021 through April 15, 2021	**Contact:**	Leonard Olien
Comments From:	Canadian Renewable Energy Association	**Phone:**	587-971-0049
Date:	2021/04/15	**Email**:	lolien@renewablesassociation.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	CanREA is supportive of modernizing DOS as there are many components that are outdated. CanREA believes that energy storage should be eligible to apply for the modernized DOS. However, whether storage developers see the modernized DOS as suitable for their projects will depend on the resolution of the issues we describe in Q9. **Quick review of points**. As a result, it is critical that CanREA and other stakeholders are provided the opportunity to review and provide comment on the AESO's "modernized" DOS proposal before the tariff is filed with the AUC in June. It is essential that either a modernized DOS, or some other appropriate tariff treatment for storage be implemented as soon as possible to remove the barrier to storage development that exists because of the current tariff treatment. CanREA recognizes that the modernization of DOS, including storage eligibility and suitability, is occurring within the existing regulatory and legislative context. The Alberta Department of Energy and initiated a process, to update Alberta legislation and regulations to reflect the unique nature of the energy storage class of technologies. CanREA requests that the AESO update stakeholders as to the impact of new regulations and legislation on the tariff treatment of storage. New tariff treatment is needed immediately to remove the barrier to potential investments in energy storage technologies and regulatory/legislative changes are needed to facilitate the efficient, long-term market participation of energy storage technologies.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Several aspects of the current DOS service need to be modified. 1) Eligibility: The AESO requires that a participant has a business opportunity that would not be taken advantage of under a DTS contract. This is a perpetual condition for any stand-alone or generation co-located energy storage resource. Therefore, stand-alone energy storage and generation-hybrid energy storage resources should qualify for DOS as a blanket condition. This is a quality that is fundamentally different for energy storage compared to existing DOS users. CanREA recommends that AESO consider whether this fundamental difference can be managed within a modernized DOS framework or whether a different opportunity service is more appropriate. 2) Pre-Qualification: Storage projects would need to receive approval for DOS qualification from the AESO before the final investment decision is made by the market participant, which may around two years before COD. 3) Temporary: This condition presents a fundamental barrier to the use of DOS for energy storage resources. Projects will not be developed if there is a risk each year that the project will not qualify for DOS and would have to resort to DTS to charge the facility. CanREA recommends that the temporary nature of DOS be removed, and the term of service be submitted by the market participant as part of the DOS application. 4) Availability of System Capacity: This concept needs to be modernized and quantified. While it is reasonable that DOS continue as an interruptible service, the concept of adequate capacity on the transmission system needs to reflect the interruptible nature of the DOS service and the actual behaviour of existing load resources. For example, consider a location that has 100 MW of capacity for load and an existing DTS customer with an 80 MW contract, but a 50% average utilization rate. The addition of a 50 MW storage resource at that grid location would result in far more efficient use of the transmission system even though the DTS availability is only 20MW. The AESO will need to: a. Develop a description of the process for how the availability of capacity will be evaluated. b. Decide what data will be used by the AESO to make the evaluation and what of that data is appropriate to be shared with the market participant and what can be shared with the public.

		c. Engage with stakeholders to determine if the current suite of publicly available data is sufficient for project developers to make informed business decisions around curtailment risk, or determine what, if any, further data should be made available. 5) Curtailment Mechanism: The AESO needs to decide if curtailment of a withdrawal from the energy system under DOS will occur by dispatch instruction or by automatic operator control. Once this has been decided then it may be reasonable to revisit the existing levels of service. In any case, the "Utilization" step of the current process is unnecessary and should be removed. System operators will be aware of DOS resources on the grid and do not need a monthly warning that a DOS resource may be withdrawing energy from the grid. 6) Failure to Comply: Currently, failure to comply with a curtailment directive could lead to disqualification from using DOS. Failure of a DOS resource to comply with a dispatch instruction to curtail should be treated like any other deviance from a dispatch instruction without the risk of losing access to DOS. 7) Rate: On April 13th, the AESO published rate estimates under the new Tariff structure which included an estimated charge of $15/MWh for 7-minute DOS service. CanREA recommends that the AESO consider both an additional, quicker response service level, with a corresponding lower cost, and a service level at a cost lower than XOS service but would be subject to curtailment before XOS. For simplicity, the two services could be offered as a single product, however this might not be ideal. The modernization of DOS is certainly overdue, and a modernized DOS could be of interest to energy storage resources.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	

15	Do you have any additional implementation considerations the AESO should consider?	
16	Do you have additional clarifying questions that need to be answered to support your understanding?	
17	Additional comments	CanREA is encouraged that the AESO is contemplating an alternative to DTS service for energy storage that can be implemented immediately. We look forward to further discussions on the suitability of a modernized DOS or, if necessary, an alternative tariff treatment suitable for energy storage resources. The modernized DOS, or alternative, needs to be filed for AUC approval as soon as possible to remove the existing barrier to development for the many energy storage projects that have already been proposed. Further, CanREA suggests that DOS modernization, or equivalent, be filed separately, and no later than, the filing of the re-designed Bulk and Regional tariff. Given the magnitude of change proposed for the Bulk and Regional tariff, an AUC proceeding could require a significant amount of time and result in considerable delay between filing and implementation. Relatively speaking, the filing for a modernized DOS, or equivalent, would be much simpler, could be approved in a much shorter time, and remove the barrier to development in a more timely fashion. Because the modernized DOS is being proposed within the context of a full Bulk and Regional tariff re-design, a fuller review of the tariff treatment for the energy storage class of technologies will be required in the near future. Certainly, a review will be warranted after regulatory and/or legislative changes that define the energy storage class of technologies.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Matthew Davis
Comments From:	Capital Power			**Phone:**	403.540.6087
Date:	2021/04/15			**Email**:	mdavis@capitalpower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Capital Power appreciates the opportunity to provide comments on the March 25, 2021 stakeholder session. The session was useful in that it provided the AESO a forum to explain their preferred rate design and the opportunity for stakeholders to ask questions. However, the material provided was limited and did not sufficiently support the AESO's preferred rate design. This was evident in the stakeholder questions, where numerous attendees requested further analysis or evidence to support the proposed rate design. Given this, Capital Power recommends the AESO complete further analysis and provide this information to stakeholders prior to submitting the rate design for AUC approval.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Capital Power has no comments at this time.

3.	Are you supportive of the AESO's preferred rate design? Why or why not?	Capital Power is not supportive of the AESO's preferred rate design at this time. While Capital Power is supportive of the AESO's objective to move away from the current 12-CP model which has been identified as eroding billing determinants and incentivizing self-supply / grid defection, the AESO's preferred rate design fails to accomplish this objective. In fact, it could exacerbate the issue as it encourages energy and capacity bypass and a distortion of the market. There are a significant number of net-metered and self-supply/export customers in Alberta currently managing their transmission costs by responding to the incentive that 12-CP generates. Capital Power is concerned that rather than maintaining grid connected customers, the AESO's preferred rate design will continue to result in level playing field concerns as the tariff signals will continue to drive customers to develop less efficient generation on-site to avoid the additional energy-related transmission costs. This likely commercial response of these net-metering customers to the signals sent by the proposed rate design is notably absent in the AESO's analysis and is of concern because it will result in further cost-shifting to less responsive loads and is contrary to cost responsibility and causation principles. Finally, Capital Power re-iterates its support for rate design mitigation approaches over billing adjustments that the AESO is proposing here. As discussed in Capital Power's January 12th submission in response to the AESO's fourth stakeholder engagement session, bill adjustments are less aligned with FEOC principles, particularly permanent reductions, and appear more arbitrary than a mitigation approach based on rate design. Capital Power looks forward to further discussion of the AESO's proposed mitigation approach in the upcoming sixth stakeholder session. Respectfully, the amount of analysis provided by the AESO to support a full review and assessment by stakeholders of their proposal is inadequate, and as observed at the March 25th stakeholder session there remains numerous unanswered questions by stakeholders from all industry groups (generators, loads, wires owners, consumer groups etc.).

4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	Capital Power provides the following comments: **Reflect Cost Responsibility** – The AESO's proposed change to its functionalization of transmission costs between bulk and regional demand related costs and those that facilitate in-merit energy is appropriate, but the decision to assign 100% of the in-merit costs to energy is problematic and should be reviewed. The AESO has not considered how customers will respond to the proposed tariff in their analysis. Customer behaviour may in fact lead to further billing determinant erosion and cost-shifting. In addition, the benefits that customers receive merely by connecting to the grid, like access to a reliable source of electricity and to the competitive wholesale market are not wholly captured in the AESO's preferred rate design. **Efficient Price Signals** – Capital Power is concerned the AESO did not consider how the preferred rate design impacts the energy-only market price signal, which is the signal that should incent generation investment in Alberta. As noted previously, Capital Power believes the preferred rate design will further incentivize investment in onsite generation as a means to avoid transmission costs. In addition, the AESO did not explain how the price signal will create an incentive for customers to alter their behaviour to avoid future transmission build. **Minimal Disruption** – Capital Power does not agree that the preferred rate design results in minimal disruption to customers that respond to 12-CP. Rather, it appears that the customers that respond heavily to 12-CP will be the most impacted. The AESO's rate design and/or mitigation options should reduce the impact on existing load to prevent load destruction and also attract new investment. **Simplicity** – Capital Power agrees that the AESO's preferred rate design is simple. However, it may be oversimplified in that it does not properly account for 1) net-metering or self-supply/export; 2) energy flows on transmission system during different times of day; 3) customer behaviour; 4) grid efficiency; and 5) impact to price signals. **Innovation and Flexibility** – Capital Power does not agree that the preferred rate design provides optionality while not pushing costs to other customers. The opposite is true – there is minimal opportunity for customers to innovate, and where they may be able to change their behaviour, costs are still being pushed to other customers.

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	Capital Power reiterates its previous comments that the AESO and their consultant NERA revisit the allocation to the energy component of the proposal. Capital Power believes that facilitating in-merit energy is more complex than the simple assignment to energy infers. Further, the AESO should include how the proposed tariff will alter behaviour in the market as it is a balance to ensure that the energy-only market provides the appropriate signals to invest generation capacity.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	Capital Power supports the AESO's decision to retain an embedded cost approach as it best aligns with the need to recover already sunk investments.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	Capital Power appreciates the additional detail that the AESO released on April 13th, 2021. The future rate projections are valuable to ascertain how the AESO's proposed tariff could play out over time. The additional detail on the five-year average 12 CP also assists in answering outstanding questions regarding that aspect of the AESO's proposal.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Capital Power believes that the AESO must provide more information on how DOS could be modernized to fully comment on the AESO's proposal. It is important that the development of an opportunity service must be technology neutral (i.e. should equally be available to other interuptable loads). While DOS 7 appears to be the term of DOS that could be most appropriate for many ES applications, in interacting with the AESO's revised tariff, it could result in curtailable intra-AB storage being charged a higher tariff than exports for the same, if not more flexibility in responding to system events. Capital Power suggest that the AESO when developing new opportunity service(s) include a comparison to export opportunity service (XOS). Based on the limited use of DOS that exists today, Capital Power considers it unlikely energy storage assets would find it economic under the current eligibility requirements.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Subject to additional details that Capital Power expects as the AESO articulates its revisions to opportunity service, several of the existing terms and conditions will likely require consideration. These include: • *Qualification:* for investment certainty, it is important to understand early in the project development cycle what costs are to be expected. • *Annual Term:* Development will require more than a single year of certainty on whether a project is subject to opportunity service or full DTS. • *Potential loss of system access:* Capital Power would need to better understand the consequences of what would occur to a project that was under DOS if a DTS customer connects as well. • *Compliance:* Current terms around revocation of DOS qualification for non-compliance may need to be addressed. Should a market participant under a future opportunity service rate be subject to dispatch by the system controller then Capital Power would expect that "must comply" obligations would apply as with any other market participant. Further, the AESO has indicated a desire for any future opportunity service to not erode DTS, Capital Power continues to suggest that the AESO evaluate how market participation can be used to further this issue as inherently, any sink asset that has a bid in the merit order is subject to receiving directions from the system controller to curtail under varying circumstances. This may further encourage the "full-range" market participation from energy storage assets that the AESO aspires to through their energy storage market participation initiative.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	While Capital Power views rate design-based mitigation as more appropriate under FEOC than targeted billing adjustments, it does appreciate the AESO's efforts to work with customers with a larger impact to develop and identify consistent mitigation options that will be shared in a transparent manner with the broader stakeholder community. Capital Power looks forward to those options being shared at the upcoming sixth engagement session.

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	Capital Power suggests that the AESO also consider the benefits/drawbacks of each proposed mitigation options. These should be expanded to include the benefits/drawbacks on the entire system and not just the customer that the mitigation option is being applied to. Providing this information will assist the broad stakeholder group in their assessment of the options and ensure that cost responsibility is being maintained.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	While it is premature to comment on the mitigation options that have yet to be identified, as previously discussed, Capital Power cautions against the use of permanent mitigation measures. This would perpetuate an unlevel playing field for transmission customers.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Capital Power supports rate design mitigation over bill adjustment mitigation. As previously noted, the use of bill adjustments is more arbitrary and less aligned with FEOC principles. Outside of modernizing opportunity service, the AESO's current approach does not appear to create mitigation options that would be based on rate design. Baring a change in the AESO's approach, Capital Power suggests that transparency and consistency be applied when developing mitigation options.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Capital Power has no comments at this time.

15	Do you have any additional implementation considerations the AESO should consider?	Capital Power believes that transitioning from the 15-minute to hourly CP interval are reasonable and will provide more alignment with market settlement which is hourly.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	Capital Power would like to better understand the AESO's expected regulatory timelines and when the AESO would expect any new tariff to come into effect. Of particularly interest is to what extent can opportunity service modernization be separated from the rest of the AESO's proposed tariff modernization. Capital Power would re-iterate its previous comments that much of the opportunity service effort can be separated from the broader bulk and regional tariff application. Further, given that there is only one planned consultation session between now and the expected filing date, Capital Power is concerned that there is insufficient time in the consultation process to test what the AESO develops in its modernization of opportunity service. This could lead to in-efficiencies as the AESO's recommendation will have to be tested in front of the commission and not through stakeholder consultation.
17	Additional comments	Capital Power appreciates the AESO's transparency in providing the AUC staff questions. Should the AESO choose to respond to any of the questions, Capital Power would expect the same level of transparency with stakeholders as currently demonstrated.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Raj Retnanandan
Comments From:	Consumers Coalition of Alberta			**Phone:**	Contact Phone Number
Date:	[2021/04/15]			**Email**:	retnanandan@emrc.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes-the session was helpful from the perspective of understanding the AESO's views
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes-the session was helpful from the perspective of understanding the AESO's views

3.	Are you supportive of the AESO's preferred rate design? Why or why not?	**Supportive:** i) CCA supports, the allocation of the portion of the bulk system that is used to accommodate area peaks outside of the coincident peak as part of the costs to be recovered on the basis of non-coincident peaks. CCA supports this approach because it is consistent with cost causation iii) CCA supports the concept implicit in the AESO's proposal to treat, the difference between costs attributable to area peak generation (arising from in merit generation) and costs attributable to area peak load, as area related costs. However, CCA disagrees with the view that such costs, which arise from in merit generation, ought to be considered as energy related and recovered from load customers on the basis of energy. ii) AESO's proposal to mitigate rate increases aising from rate restructuring to within 10% **Not supportive:** i) Classification to Energy: CCA supports the concept implicit in the AESO's proposal to treat, the difference between costs attributable to area peak generation (arising from in merit generation) and costs attributable to area peak load, as area related costs. However, CCA disagrees with the view that such costs, which arise from in merit generation, ought to be considered as energy related costs and recovered from load customers on the basis of energy. The classification of a portion of system costs to energy, based on in merit energy inflows (supply), is based on the assumption it is a cost causation factor to which load customers could respond. However, load customers have no ability to influence the location, quantum or timing of plant additions required to meet the needs of in merit energy inflows, through their behaviour in terms of using the proposed DTS tariffs. In CCA's view, rather than classifying costs related to in merit energy inflows as energy related, the AESO may wish to look at the correlations between peak in-merit energy inflows and area peak loads and come to a better understanding of the correlation between peak in-merit energy in-flows and area demand billing determinants and bulk system demand billing determinants. This would allow the costs classified to energy to be recovered through appropriate demand billing

		determinants which could be influenced by DTS customer behaviour. Using appropriate demand billing determinants as part of DTS for recovery of costs deemed as generation related costs could provide a more effective tool for DTS customers to influence generators' in merit peak flows. CCA has argued in the context of the DCG credits proceedings (ID26090) that there should be contractual arrangements with TCG and DCG customers, outside of the AESO tariffs, to capture the benefits and costs of in merit energy flows and thereby provide appropriate forward looking signals for generator location. CCA is concerned that a high energy component in DTS rates as proposed by the AESO, could exacerbate load defections resulting in higher costs for remaining load customers for the following reasons: • High DTS energy charges could encourage uneconomic by pass of the system; • There is uncertainty associated with the Govt.'s, decision on gross versus net metering for new self supply and export customers. If net metering were to be allowed, that would contribute further towards erosion of energy billing determinats and therefore higher DTS energy rates; • Under the AESO's proposals, as area peak generation increases with addition of DCGs and TCGs over time, increasingly greater proportions of bulk system costs could be shifted to energy classification triggering higher energy costs/charges and further load defections; • The Distribution Systems Inquiry report talked about preventing uneconomic by pass and, all the consultants who appeared in that proceeding recommended a shift towards fixed charges as opposed to energy charges to mitigate stranded investment ii) CP Demand Cost Recovery using 5 year averages-discussed under 4 iii) Reservation charges based on billing capacity and NCP charges for actual usage of non bulk system related costs-discussed under 4 iv) Complete exclusion of marginal cost price signals-discussed under 4
	Questions	**Stakeholder Comments**

4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	a & b) The AESO's proposed rate design does not appropriately reflect cost responsibility based on cost causation nor does it provide efficient price signals. First, the recovery of fixed plant costs, deemed as caused by generators and classified as energy related costs, from load customers whose consumption behaviour has no influence over generator location (which is the primary driver of in merit generator flows) results in a mismatch between cost causation and price signals. Second, the AESO's proposed rate design does not provide efficient price signals for minimizing future plant additions that are deemed to be driven by coincident peak demands. In CCA's view the 5 year average CP demand approach using a single hour in each month, for recovery of a portion of bulk system costs, neither reflects cost causation nor does it provide efficient price signals for customers to reduce consumption during any other peak hour that has a high probability of giving rise to future plant additions. For example, if the CP hours were based on a group of hours in each month, with a high probability of driving system additions (example: hours with 90% probability of driving system additions) that would result in better alignment between cost causation and price signals as opposed to using historical average CP hours as proposed by the AESO. Third, the AESO has proposed a single billing capacity charge for recovery of non bulk system costs. A high billing capacity charge could incent load defections and requests for contract reset including waiver of PILON. This issue could be addressed by having a reservation charge based on billing capacity and a non ratcheted NCP demand charge applied to actual usage. Fourth, the AESO has not given recognition to marginal cost pricing to any degree. However marginal cost pricing could encourage efficient consumption decisions at the margin. For example, if the CP and NCP demand charges could reflect marginal costs, any residual could be reflected in a capacity reservation charge which could be the same as the billing capacity charge. In other words, acutal usage, whether under CP recovery or NCP recovery, would reflect marginal costs to the extent feasible, while reservation costs (or fixed billing capacity charges) would reflect the residual costs. c) The AESO appears to have designed the rates with minimum structural change to existing rates. The AESO states, it is not expected that any customer would have a total bill increase of more than 15 per cent. While minimizing changes to exiting rate components may suite the AESO's convenience, this should not be the

		measure of whether the proposed rates are minimally disruptive or not. Rather, the measure of whether the proposed rates are disruptive or not must be based on judgement by weighing efficiency of rates in providing appropriate price signals and reflecting cost causation against, minimizing customer impacts. It must be recognized that the existing rates were designed to meet requirements of a system where load was the primary driver of plant additions. This has changed and given way to two way flows of electricity and self generation. Therefore, some degree of disruption is necessary provided rate stability at the customer level is achieved. In this regard CCA supports the AESO's intention to minimize transmission cost increases to no more than 10% increase in transmission costs. Further, some level of disruption is necessary in order to minimize uneconomic bypass of the system due to decreasing costs of variety of self generation options. The prospect of self generation eroding system billing determinants could have serious consequences for future ratpayers, unless addressed at this time. d) The use of 5 year monthly averages for determining CP demands does not appear to be simple, nor does it provide the appropriate forward looking price signals. e) Innovation and flexibility would be best served if apropriate marginal price signals are provided for consumption at the margin

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	CCA recommends the following: • Broaden the CP hours to capture all hours with a high probability of driving system peaks in each month to replace the proposed average of historical 12 CP demand hours • Keep energy classification to 10% or below and shift about two thirds of costs proposed to be classified as energy (31% as per AESO) for recovery via non ratcheted NCP demand and billing capacity (or capacity reservation). This reclassification of a portion of the 31% energy costs in this manner for recovery through area costs demand billing determinants, stands to reason because the in merit energy peak inflows appear to be essentially impacting area peak loads as per Slide 39. • Split the costs proposed to be recovered by billing capacity, to be recoveed partly through a reservation charge based on billing capacity and partly through non ratcheted NCP demand charges, for actual use. The treatment of reclassified energy costs partly for recovery through billing capacity and partly for recovery through non ratcheted NCP also stands to reason as this could help minimize potential load defections and requests for contract resets, by minimizing connection charges (or billing capacity) • Use marginal costs based on historical long term incremental costs to set CP and NCP demand charges (i.e. usage charges) to the extent possible; Use any residual costs to be recovered on the basis of billing capacity (or capacity reservation charges)
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	These are discussed in 3
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	They appear to be reasonable

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	CCA is supportive of the AESO's proposed criteria for DOS. The following may be worth further consideration: • A time differentiated DOS charge that would incent DOS use during off peak hours versus on peak hours to encourage use during off peak times. • When energy storage is providing ancillary services, it requires greater certainty for charge cycles. Consideration should be given to the DOS rates that would apply to storage under these circumstances to ensure the charge cycles are not interrupted when the storage asset is providing ancillary services.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Please refer to 8
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	CCA supports this approach

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	CCA generally agrees with these principles.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	In CCA's view mitigation options could be viewed as another tool that could be considered either as part of the overall rate restructuring or separate from the overall rate restructuring. Considering mitigation options as a separate tool outside of rates, provides the AESO with greater flexibility to restructure go forward rates. If mitigation were used as a separate mechanism it should be phased out after a reasonable period of time.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Yes-based on the 10% maximum increase for customers after mitigation
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Requests for adjustnment of contract capacity or waiver of PILON requirements must be considered on a case by case by the AESO taking into consideration, the opportunity for uneconomic bypass of the system and the go forward revenues under restructured rates. The objective should be to ensure there is no undue shifting of costs from one group of customers requesting PILON waiver or contract reset, to other customers.

15	Do you have any additional implementation considerations the AESO should consider?	In CCA's view it is better to delay the GTA filing for implementation of new rates in order to get it right, rather than rush into a rate design that appears to have little support and which does not give due recognition to go forward risks associated with load defections.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	CCA requested at the March 31, 2021 meeting, a model that would show by POD, categorized and listed under each DFO and listed for all other individual PODs showing annual bills under existing and proposed rates. If this information could be provided that would help CCA assess overall rate impacts arising from rate restructuring.
17	Additional comments	CCA is mindful of the time constraints the AESO is working under. CCA is also appreciative of the excellent work done by the AESO to bring the Phase I filing to this stage. However, the Commission Staff has raised a number of questions. In order to avoid a contentious hearing and to arrive at an optimal rate design, CCA would not object to the AESO requesting further time for filing of its upcoming GTA.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Dan Chapman
Comments From:	Chapman Ventures Inc.			**Phone:**	403-831-8413
Date:	[2021/04/15]			**Email**:	dan@chapman-ventures.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session provided a valuable platform for stakeholders to pose questions and explore the AESO's tariff design proposal. We appreciate the opportunity to provide commentary and continued engagement.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable and allowed good dialogue between Market Participants and the AESO regarding rate impact.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	Chapman Ventures is not supportive of the AESO's rate design for Bulk and Regional Charges. Chapman Ventures is supportive of using DOS rates for energy storage if the DOS rate and terms and conditions are appropriately modified. Although, it would be our preference to have a storage-specific tariff acknowledging the unique capabilities and value offered by energy storage, Chapman Ventures believes that an interruptible tariff is an improvement to rate DTS. At a high-level, Chapman Ventures supports the use of a modernized DOS tariff; however, this support is predicated on the assumption that elements of the existing DOS tariff are modified to facilitate fulsome market participation by energy storage assets. It is our understanding, from the rate sheet provided by the AESO, that Rate DOS charges will increase substantially under the proposed tariff structure. Chapman Ventures is concerned that the proposed DOS tariff rate will continue to render energy storage charging from the electricity grid as a broadly uneconomic activity, reducing the positive impact that energy storage could have for Alberta's load customers.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	No, Chapman Ventures does not believe that the AESO's preferred rate design meets the rate design objectives. Drastically increasing the energy charge will not lead to a tariff that properly reflects cost responsibility. Grid costs are mostly fixed in nature. Taking a fixed charge and collecting it from AESO customers on a variable cost/MWh basis does not properly reflect cost causation. The AESO constructs transmission facilities based upon an assessment of peak load. Collecting on a $/MWh basis does not properly allocate costs to low load factor customers and is therefore not a rate that is based upon a cost causation principle. DOS rates are heavily influenced by the size of the energy charge. A drastic increase in DOS rates that is proposed by the AESO can only be justified if actual variable costs have increased. The AESO's proposed rate design arbitrarily increases the variable component of the AESO's tariff and therefore is not justified.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	The AESO should collect fixed charges from its customers to reflect the fixed nature of transmission costs. Creating a variable cost from fixed charges does not properly reflect the fixed cost nature of transmission costs. The AESO's rates should be modified to properly reflect cost causation.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	N /A
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	N /A

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Chapman Ventures applauds the AESO's acknowledgement that the DTS rate, in its current form, does not support economic charging behaviour of energy storage from the AIES; and the subsequent consideration that non-firm rates could encourage participation of flexible market assets, such as energy storage. Overall, Chapman Ventures supports the use of a modernized DOS tariff; however, this support is predicated on the assumption that elements of the existing DOS tariff are modified to facilitate fulsome market participation by energy storage assets. Chapman Ventures supports the following eligibility criteria for DOS as listed on slide 74 of the March 25 stakeholder session presentation: 1. "Use would not occur under any other rate". Rate DTS is economically destructive to energy storage participation in the energy wholesale energy market. Energy storage follows price signals to store electricity from the grid when it is economically prudent to do so (i.e. during instances of low Pool Prices). Adding the Rate DTS to the Pool Price renders energy storage asset participation broadly uneconomical. 2. "Must have alternative energy source or a "market opportunity" where the cost of receiving additional electric energy under Rate DTS renders the opportunity uneconomic." Investing in energy storage under Rate DTS renders projects broadly uneconomical. Firm electricity is required for the facility auxiliary loads and thus requires a relatively small Rate DTS contract. However, the incremental grid electricity consumption required to charge an energy storage asset is uneconomical under Rate DTS. Chapman Ventures believes that the following DOS eligibility criteria, as listed on slide 74 of the March 25 stakeholder session presentation, require modification: 1. "Sufficient transmission capacity." Ideally, energy storage would qualify for a storage-centric firm service rate, at a much lower tariff rate charge than the proposed Rate DTS and Rate DOS charges. It should be acknowledged that energy storage is capable of providing broad benefits to the Alberta electric system, and subsequently the users of that system (both load and generation). Under the AESO's proposed tariff structure, if an energy storage asset elects to connect to the system, it is understood that Rate DTS contracts take precedence over those contracts for Rate DOS, which are interruptible. Therefore, an energy storage market participant that elects to construct a facility and connect under rate DOS should be permitted to do so using its own

		assessment of available transmission capacity which would be based upon a grid study. The AESO should consider modifying this criterion in the modernized DOS tariff. 2. "Is temporary or repeated short-term use." Most energy storage assets that qualify for the modernized Rate DOS will exclusively use Rate DOS for all charging energy purchased from the grid. This would remain the case unless an alternative rate structure is developed and instituted that better serves energy storage assets, such as a future Energy Storage-centric tariff.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	The following components of the current DOS implementation limit the use of excess transmission, particularly as relates to energy storage: 1. **Determination of Rate DOS Charges**. The existing Rate DOS Charges are based on the "Energy" portion of the AESO Bulk and Regional Tariff. Slide 74 of the March 25 stakeholder session presentation illustrates that the "Energy" portion of the charge was $2.18/MWh (based on the 2019 Test Year), but increases to $10.19/MWh (based on the AESO preferred rate modelling for 2019). This is a 467% increase to this cost element, which happens to be a component for the cost basis for Rate DOS. The AESO's latest tariff rate estimation, made available to stakeholders on April 13th, estimates that the DOS Rate will increase to $15/MWh. This triples the DOS rate, and therefore triples the rate that applies to energy storage grid charging. **Chapman Ventures is highly concerned that increases to the DOS 7-minute charge will prove cost prohibitive to energy storage participation in the Alberta electricity grid. Chapman Ventures also questions the cost causation basis of drastically increasing the energy charge in the Bulk and Regional tariff.** 2. **Rate DOS Types**. It is our understanding that the existing three Rate DOS Types (DOS 7 Minutes, DOS 1 Hour, DOS Term) were created to serve a certain set of load service considerations, such as temporary provision of excess grid electricity (beyond a proponent's Rate DTS contract) during outage of a load customer's onsite generation. The existing rate DOS types do not reflect the advanced operational capabilities of energy storage, including the ability to satisfy recall directive response times far shorter than 7 minutes. **In modernizing DOS, Chapman Ventures recommends that the AESO considers implementing faster responding DOS types (i.e. DOS 1 Second, DOS 30 seconds, DOS 1 Minute).** 3. **Take or Pay Provision**. Energy storge assets will use Rate DOS for charging over the life of the installed asset. Therefore, as far as an energy storage asset is concerned, this is not a "temporary or repeated short-term use" case. **Chapman Ventures requests that the take or pay provision does not apply to assets that satisfy the other eligibility requirements to participate in rate DOS.** **4. Eligibility – Economic**. Energy storge assets will use Rate DOS for charging over the life of the installed asset. Therefore, as far as an energy storage

		asset is concerned, this is not a “temporary or repeated short-term use” case. The market participant can certainly indicate it would not increase metered demand under Rate DTS, if Rate DOS was not available, as this would be economically destructive to the energy storage asset.
10	Do you have any comments on the AESO’s targeted engagement approach for mitigation discussions?	Chapman Ventures elects to reserve commentary to the suggested energy storage tariff treatment.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party’s transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	Chapman Ventures elects to reserve commentary to the suggested energy storage tariff treatment.
12	Based on the AESO’s mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	Chapman Ventures elects to reserve commentary to the suggested energy storage tariff treatment.

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Chapman Ventures elects to reserve commentary to the suggested energy storage tariff treatment.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Chapman Ventures elects to reserve commentary to the suggested energy storage tariff treatment.
15	Do you have any additional implementation considerations the AESO should consider?	Chapman Ventures would appreciate further discussions on the DOS rate design, prior to the AESO filing its tariff. To date the DOS concept has only been broadly discussed and a detailed rate sheet and terms and conditions have not been released. Chapman Ventures would appreciate an opportunity to comment on the DOS rate details as they become available.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	Chapman Ventures is not following the logic of the AESO's proposed DOS rate sheet. A discussion on the DOS rate calculation would be appreciated. It would be helpful to confirm which portions of tariff cost allocation are suitable for recovery through the DOS tariff.
17	Additional comments	Thank you for the opportunity to comment. We look forward to future engagement regarding tariff design and implementation impacting energy storage.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Dear Mr. Hall

SUBJECT: Bulk and Regional Tariff Design Stakeholder Session

I write on behalf of the cities of Lethbridge and Red Deer, who wish to share their feedback on the presentation and materials from the AESO's March 25th and 31st sessions. Following that session, the AESO requested parties to respond to seventeen questions. The cities' response is provided below.

Questions 1 & 2:

Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?

Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?

The cities consider the AESO's sessions to be useful for understanding the positions of various stakeholders.

Question 3:

Are you supportive of the AESO's preferred rate design? Why or why not?

In prior consultations and correspondence, the cities have framed their previous comments based on four over-arching principles that they support.

1. Reduce and eventually eliminate the amount of transmission cost recovered from a charge that is based on use during only one hour of the month.

2. Transition toward a tariff where the billing determinants are defined in advance so that the distribution utility has more opportunity to flow through the same price signal to its customers.

   The prospect of discovering which hours are premium priced only after consumption occurs is a concern because it creates an unofficial class of customers who are uniquely equipped to guess the peak period and avoid tariff charges. The majority are either not equipped to guess or do not have the same opportunity to avoid tariff charges even if they could guess.

3. New tariff charges should be simple and accessible so that more end-use customers can understand broadly which behaviours and usage patterns are to be rewarded.

4. New tariff charges should promote better utilization of the system that exists.

The AESO's proposed rate design is marginally simpler and does reduce the amount of transmission cost recovered during one hour of the month. However, the period to which the price applies is still not known in advance, so the issue is not actually addressed. Moreover, reducing emphasis on a per-MW charge in favour of a per-MWh charge is a step backward in that it would charge more for higher load factor customers compared to current day. In effect, better utilization is penalized. On this basis, it is difficult for the cities to support the AESO's proposal.

Overall, the cities would rank "Bookend A" from Session 2 and Proposals 3 and 4 from Session 3 ahead of the AESO's current proposal. Bookend A and Proposals 3 and 4 have the same upside as the current proposal but have an end-goal of eliminating the coincident metered demand charge entirely. Moreover, they also promote better utilization.

Question 4:

Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not?

a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid)*

b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build)

c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted)

d) Simplicity (Simplicity and clear price signals while achieving design objectives)

e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers)

For the most part, the AESO's rate design objectives are not incompatible with the cities' principles. However, the AESO's interest in minimizing disruption may be hindering the AESO's ability to focus on the right or corrective solution for the long run. Minimizing disruption is a laudable goal, but it should be considered sequentially: start with the desired end-state, then work toward a transition or path to that outcome that will minimize disruption.

One message that factored predominantly in the AESO's presentation is that usage during many hours affect the need for system expansions. The AESO's conclusion is to depend more on a per-MWh charge, a price signal that does not discriminate whether it is the user's first or last MWh or whether the MWh was recorded at 3 am or 3 pm. The AESO appears to recognize that, notwithstanding the circumstances affecting system stress and the need for future expansions are nuanced, broad postage-stamp price signals are the pragmatic solution. Where the cities do not agree with the AESO is that a per-MWh charge is *the* pragmatic solution because this signal is too blunt.

Alternatively, the same cost-based argument could be used to support a ratcheted per-MW demand charge because such a charge does not discriminate as to when and how many times a peak is reached: one peak per year can matter just as much as reaching the same peak every week. This price signal also communicates that usage at 3 am is not necessarily problematic, although a peak at 3 am could be just as impactful to system planning as a peak at 3 pm. This would be particularly true if major loads in a particular planning region all

shifted load to the overnight period. Unlike the proposed per-MWh charge, however, holding the current per-MWh charge constant and recovering more cost from a ratcheted demand charge will reward better utilization.

Question 5:

Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.

As mentioned above, the cities are of the view that the AESO could improve upon its rate design proposal by focusing on minimal disruption only after the other objectives are best met. The desired end state need not be achieved in a single step, but a transition plan need not be complicated. Impacts can be mitigated by gradually reducing the old charge while gradually increasing the new charge.

Question 6:

Please describe any areas in which you are aligned with the AESO's preferred rate design.

Please see the cities' response to question 3.

Question 7:

Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?

To the extent that a billing determinant changes from a 15-minute measurement to a one-hour measurement, billing determinants have changed in the AESO's proposal even though

the subsequent analysis proceeds as if they are the same. As long as all parties understand that the AESO's proposed rate is indicative only and the AESO is not making firm rate mitigation commitments to transmission-connected customers based on this analysis, the cities do not have any concerns.

Questions 8 and 9:

Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not?

And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.

Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS).

How might those components of DOS be improved?

The cities do not have enough information to form an opinion on the AESO's proposal.

In earlier sessions, the cities suggested that the AESO first resolve whether storage is a unique and useful means to optimize the transmission system, and if so, how optimization is best achieved. Once these questions are resolved, it becomes much easier to conceive of a pricing scheme that supports this objective.

Slide 71 suggests some attributes of storage that may be beneficial, though they are broadly described and could apply to more than just storage. The chosen approach to rely on an opportunity rate also seems to imply that the AESO does not consider storage to be unique because it deems a general rate class to be sufficient. Opportunity rates are difficult to implement for the reasons the AESO has noted: particularly the difficulty to ensure that it is attracting new customers and not existing customers who would otherwise be willing to pay the regular rate. The potential problem here is that so many qualifications will be necessary that the opportunity rate becomes a de facto storage rate anyway.

On the other hand, the AESO also notes that the benefits are situation and location specific, and that the qualification for the opportunity rate will need to take this into account. This might have implications for uptake because if the location changes and the storage provider's

costs are sunk, this might be perceived as additional risk and negatively affect the project economics.

Ultimately, the cities remain uncertain as to how the AESO believes energy storage should be deployed and utilized to benefit the transmission system. If it has a need related to specific operating conditions, the best treatment might be to publicly tender and procure service outside the tariff so that the AESO can contractually define what service is required. If the transmission system has no need for storage, then perhaps few or no accommodations are required. This is not to say that storage is unwelcome, just that the value or benefits are not transmission-related and the transmission system should not be making extra efforts to favour one technology over others if it brings no benefit. The point being is that we have yet to establish whether the AESO believes there is a unique benefit to storage, and if so, to describe how the benefit is unique.

Questions 10-15:

Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?

Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale.

Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale

Are you in favour of some type of mitigation? Why or why not?

If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?

In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?

Do you have any additional implementation considerations the AESO should consider?

Ordinarily, the cities would be concerned that the above principles focus on protecting a customer from the price impact without necessarily requiring a behavioural change as well. In other words, appearing to guarantee no more than a ten percent rate impact with no strings attached may not be prudent. Nevertheless, the AESO's proposal does not appear to encourage any behavioural shift for price-responsive loads and so such concern is not as high of a priority for this situation.

With improvements to rate design to encourage better utilization, the cities suggest that phasing in new charges while phasing out old charges is a more effective and less burdensome approach than the case-by-case process indicated here. The pace of change can be selected based on the expected impact for the most-affected customers, but because the tariff applies to everyone (as opposed to a discounted tariff applying to some customers), then price responsive loads are rewarded to modify behaviour as well.

Question 16:

Do you have additional clarifying questions that need to be answered to support your understanding?

Please see the cities' response to questions 8 and 9.

Question 17:

Additional comments

The cities undertook to provide fulsome responses to the above questions and have no additional comments. Should any of our comments require further clarification, please feel free to contact me at (403) 781-7691.

Yours truly,

Michael Turner
President

cc: Jim Jorgensen, City of Red Deer
Jason Drenth, City of Lethbridge

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Blair Wood
Comments From:	Conoco Phillips Canada			**Phone:**	403 532 3575
Date:	2021/04/15			**Email**:	Blair.wood@conocophillips.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, the session was valuable. A smaller group breakdown would be helpful, if possible, with available technology, to allow for a more fulsome conversation with stakeholders.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, the session was valuable. It was helpful to hear more comments from participants since the previous session had a stronger focus on AESO presentations.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	Conoco is not supportive of the proposed rate design. The approximate 500% increase in the variable energy rate does not match the fixed nature of incurred transmission costs. The proposed design should be altered to reflect cost causation more accurately.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	No, Conoco does not believe the AESO's proposed design meets the rate design objectives. When the AESO splits energy and demand charges, it does so based on the total amount of load and generation. Generation is higher, and the AESO's design implies that therefore transmission has been constructed for generation and this should lead to an energy charge. Some system projects were built for primarily for generation and others primarily for load, but most of the transmission rate base was constructed as CTI projects. Since the CTI projects were required by legislation, it is not clear the purpose for each CTI project. The AESO's proposed design assumes a clear distinction in the rate base, but the cost causation of factors influencing rate base growth is actual very unclear. Assuming that energy charges should be increased based upon the AESO's simplistic analysis does not reflect reality or true cost causation. Transmission costs in Alberta are primarily fixed in nature. Future growth of the transmission system is not expected with forecasted muted load growth and limited new transmission is therefore required. Continuing with a strong coincident peak signal and a new high energy charge does not reflect this reality and given these facts, it is confusing why the AESO has chosen its rate design. The remaining objectives cannot be met if the cost causation principle is not achieved. Conoco therefore cannot support the AESO's preferred rate design.

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	Conoco expects that in the future as renewables expand, and other types of generation are required to balance renewables intermittency, the AESO's proposed design will continually shift more costs onto energy (since total generation will increase as compared to load). The focus on energy in the proposal will likely lead to ever increasing energy charges. It would be helpful if the AESO would adjust its forecasted future energy charges in its rate forecast given the significant future build of renewables. The design should be altered to reflect the fact that wires costs are fixed. Drastically increasing the energy charge is therefore not justified and should be modified, perhaps to a non-coincident peak charge. A non-coincident peak charge would also support an objective of reducing uneconomic bypass as compared to an energy charge, since customers attempting to reduce transmission charges by installing generation will not be credited for each MWh produced.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	NA
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	NA
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	The AESO's preferred design will inappropriately increase the variable portion of the AESO tariff. This will in turn drastically increase the DOS charge. The AESO has shown that DOS rates will increase by about 300%. If the AESO proceeds as planned, the proposed change to the DOS rate is likely to prove to be a futile exercise. Few energy storage firms will build facilities if the DOS rate charged is exorbitant. Since export rates are similarly impacted with an increase in the energy charge the AESO should share the calculated rate for exports in its consultation.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	NA
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	The AESO is representing all ratepayers in these discussions since any concessions made will be paid for by the remaining customers. Given this, the AESO must clearly show each targeted rate exception and its justification.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	The AESO should add transparency to the list of objectives. The AESO must show clear justification to stakeholders and the Commission for any mitigation proposed.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	NA

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Yes, some form of mitigation is reasonable. Conoco supports short term mitigation for significant cost increases (over 10% of total energy and transmission charges combined). All mitigation must be complete within a reasonable timeframe (less than 3-5 years).Customers that require mitigation in the longer term to allow their business to be economic may need to apply for other rates, such as DOS.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	It is reasonable to allow for a contract reset period since over time, PILON costs will substantially increase. It is not clear why it is important that a customer not change its contract level in the last five years to receive this benefit. It would be helpful for the AESO to release an updated PILON calculator based upon its preferred design, perhaps with example calculations. It is clear than once the 5-year rolling average CP rate is implemented, PILON rates for most customers will substantially increase.
15	Do you have any additional implementation considerations the AESO should consider?	NA
16	Do you have additional clarifying questions that need to be answered to support your understanding?	NA
17	Additional comments	The Commission clarified its rate expectations in the final distribution inquiry report. The AESO must ensure that its rate proposal aligns with the Commissions thoughts included in this report. Conoco views the current preferred rate alternative as not in alignment with these expectations.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Rick Cowburn – VIDYA Knowledge Systems
Comments From:	Canada West Ski Areas Association			**Phone:**	(403) 397-8785
Date:	2021-04-15			**Email**:	Rcowburn@vidya.ca

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was clear and helpful. There are obviously many details to work out, but the approach and reasoning is clear and often compelling.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	It is most inefficient for every customer group to have to seek its own understanding of how the distribution utilities will flow this tariff through. Although this is outside the AESO's direct responsibility, it is also outside every other market participant's responsibility. Since the AESO created this situation, perhaps the AESO could seek to rectify it by working with the distribution utilities.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	Alberta's electric industry restructuring could be subtitled "The Dance of Unintended Consequences." We went into this adventure blissfully unaware of the complex long-term impacts of our decisions. A fundamental economic trade-off in creating a competitive generation market is: Giving up control of generator construction and dispatch must lower costs enough to pay for the more robust transmission system that will be required. The 2003 Transmission Development Policy enshrined this tradeoff in legislation saying "Transmission planning must be proactive in nature and must therefore lead load growth and generation development." [p.4] At the bulk system level, the Big Build has more than delivered on that goal. Now that annual load growth has dropped below 1%, and is predicted to remain so indefinitely, the industry is becoming more aware of the role that generation development has played and will continue to play in driving transmission costs. The AESO's proposal supports this realization. The splitting of costs into 'minimum system' and 'actual system' components will be controversial and will surely evolve over time; but however it is implemented, the concept reasonably reflects the fundamental economics of Alberta's electric industry.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	a) The recent 'Big Build" was driven by political decisions, in respect of which cost causation is unknown. Planning studies indicate that in the future, generation additions will be a primary cost driver. Load has not been and will not be the primary cost driver. b) Given this context, sending 'price signals' to load will be largely ineffective in avoiding future transmission build. c) Reasonably minimizing customer disruption is an important objective. However major customer representatives have often stated that no one would build a project just to obtain transmission cost savings. If 'investment' were indeed the criterion for rate impact shielding, then the original project business cases must be reviewed by the AESO to confirm that transmission savings were central and essential to the business decision. Of course the benefits of operational flexibility are many, some of which will be business related and some of which will be electricity related, including the ability to mitigate pool price excursions as well as the ability to exploit the transmission tariff's cost avoidance opportunities. In practice, 'investment' is likely not a usable criterion for providing rate impact relief as it would require extensive and frequently inconclusive analysis, and would unduly discriminate against parties based on whether they had implemented some particular type of project 'behind the fence.' d) The revised tariff is consistent with the current tariff structure, but price signals are largely irrelevant on the load side. e) The revised tariff retains the valueless 12CP cost-shifting incentives of the current tariff, albeit with a lower financial benefit. Finding new ways to shift costs to others is not productive innovation.

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	The CP and energy tariff components are undergoing the most change. Basing CP on the 5-year monthly average may somewhat reduce gaming, but given the AESO's evidence that "hours of 12-CP do not necessarily correspond to hours of peak utilization across high-voltage lines" [Slide 35] there will be little if any benefit to offset the costs being shifted to other customers. A more balanced approach might be to use a broader billing determinant that can better incent behaviours that might actually reduce transmission costs. The transmission system has been 'oversized' to enable generators to move all in-merit energy anywhere, any time. This oversizing does not automatically imply cost recovery based on energy in all hours – other options deserve consideration, particularly considering these charges' impact on high-load factor customers. Non-Coincident Peak would be a possible option; but if 12-CP was also moved in that direction, almost the entire tariff would be NCP based, which would be too extreme. A declining block energy charge would be a more balanced and traditional approach, with high-load factor energy charged at a much lower rate, while the first energy blocks are priced higher to provide a fair contribution by all customers.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	Dividing costs based on system usage is a well justified, reasonable step forward.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	Rate impacts need to be assessed on a POD by POD basis, with some provision for assessing end use customer impacts as they will be communicated through distribution tariffs.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	DOS is a familiar concept, but it may create more problems than it solves. With transmission oversupply, many customers could take the risk of interruption without fear of consequences – and then get off the rate when the risk rises. (This is exactly what happened in the 1980's with similar rate options.) Storage is an innovative service, which is likely best served by a policy adapted to its specific nature.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Indeed, that's the problem with using an inappropriate rates tool. Don't go there…a storage-specific tariff treatment would be less burdened by irrelevant DOS baggage.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	A targeted approach considering only seven PODs [Slide 63] seems likely to be unduly discriminatory. Customers served through a distribution system are proposed to receive no mitigation; only direct-connect industrials are elgible. That would be a profoundly unfair policy. Cutting confidential 'deals' would also be improper.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	While the concept of mitigation seems reasonable, its implementation would be very difficult. One fair way to implement mitigation would be as a tariff rider that applies in specified situations at the individual POD level, irrespective of whom that POD might serve. This will not be simple, as to calculate a bill increase one needs both a 'shadow' rate and some form of billing determinants. How would the 'shadow' rate be determined? Presumably this is another component of the annual AESO tariff processes, for as long as mitigation continues. What should the billing determinants be? If a customer adds a new load, any related bill increase should not be mitigated. Conversely, if a customer's load drops there should still be some level of mitigation, though at a reduced level. It is easy to see why such site-specific mitigation is virtually unknown in Alberta's electricity ratemaking.

12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	Mitigation is a form of 'grandparenting', which is inherently unfair and discrimatory against new entrants, in favor of incumbents. To the extent that grandparenting is used at all, it should be for a limited duration. (see Nigel Bankes blog article https://ablawg.ca/2019/12/02/further-thoughts-on-the-law-and-practice-of-grandparenting/)
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	In principle, mitigation seems reasonable. In practice, it will be profoundly difficult to implement. Assessment criteria may include identical treatment of all PODs, open and objective calculations, and a limited time duration.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	The Big Build's high cost is leading many parties to consider ways of reducing their costs by reducing their use of the system. Certainly in cases where a load reduction can avoid transmission expansion costs, usage reduction should be encouraged. As a general policy, though, it is fraught with difficulties.
15	Do you have any additional implementation considerations the AESO should consider?	Impact mitigation is an extraordinarily difficult challenge. Precision as to its specific proposed form will soon be necessary.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	The AESO has found a reasonable alternative tariff approach, but the devil will indeed dwell in the details. Many questions will arise in due course!
17	Additional comments	Thanks to the AESO for its openness and sincerity in industry discussions.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021 through April 15, 2021	**Contact:**	Christine Runge (Power Advisory)
Comments From:	DCG Consortium The DCG Consortium is comprised of the following members: BluEarth Renewables Inc., Canadian Solar Solutions Inc., Elemental Energy Renewables Inc., RWE Renewables Canada Holding Inc. and Siemens Energy Canada Limited. This submission represents the consensus view of the group and is submitted on behalf of the group by Power Advisory LLC	**Phone:**	403-613-7624

3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	The total energy charge is designed to account for congestion; however, congestion does not realistically have an equal probability of occurring in any of the 8,760 hours throughout a year. At a minimum, the AESO can safely design an on-peak and off-peak time frame that removes value from some hours, such as at nighttime and on weekends. This type of rate design in used elsewhere in Alberta. For example, ENMAX's D310 rate class contains an on-peak and off-peak charge where on-peak is defined on the rate sheet as "from 8 a.m. to 9 p.m. Monday to Friday inclusive, excluding statutory holidays." The AESO could create a similar definition that eliminates hours highly unlikely to contain congestion, therefore increasing the value of the energy charge in all remaining hours. This will result in a stronger price signal in hours with congestion.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	The DCG Consortium understands that the implementation of the AESO's approved adjusted metering practice will impact DCG Credits for many DCGs in Alberta. The DCG Consortium further understands that the decision in Proceeding 26090 may change the methodology by which DCG Credits are calculated. However, it is also possible that DCG Credits remain unchanged or are changed at some point in the future but continue in their current form until a new DCG Credit mechanism can be approved by the Commission. In this case, changes to the bulk and regional rates will impact the magnitude of DCG Credit revenue to DCGs. The DCG Consortium encourages the AESO to consider the impacts of changes to the bulk and regional rates that may result in decreasing DCG Credits through the same lens which the AESO views increases to customer bills. Considered in this manner, any DCGs expected to experience rate shock in excess of 10% (*i.e.,* a decrease in annual DCG Credit revenue by 10% or more) should be subject to any rate mitigation.

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	The DCG Consortium is supportive of bill impact mitigation for bill impacts >10%. As the DCG Consortium has commented many times in the past, a focus on investor certainty should be a key consideration in all significant regulatory and rule changes. If the regime changes frequently and/or drastically, this makes Alberta a difficult jurisdiction in which to invest, ultimately resulting in difficulties attracting capital into the province in the future. This applies both to industrial load customers and generation assets. Potential investors will consider the likelihood of major changes occurring in the future and will either determine that Alberta is likely to respect past investments and the regime under which that investment was made or will determine that it is simply too risky to bring capital to Alberta when there are many other jurisdictions to choose from.

14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	
15	Do you have any additional implementation considerations the AESO should consider?	
16	Do you have additional clarifying questions that need to be answered to support your understanding?	

17	Additional comments	**<u>The implication of a five-year average 12CP reduction on DCG Credits</u>** It is unclear if the AESO has thoroughly considered the implications of using a five-year average of 12CP in calculating DCG Credits. It is further unclear how a DFO would perform these calculations. In the consultation session, it was explained that the use of a five-year average 12CP response does not change the total savings, but does smooth them over five years, i.e., response to a 12CP hour in January will result in savings spread over the following five January bills. DCG Credits cannot ignore this fact. When a DCG generates under this five-year average approach, it will cause bill savings in that month's bill and also four additional monthly bills over the next five years. The DCG Credits cannot continue to be calculated in their current form, which consider only the impacts to that specific month's bill. A DCG needs to continue to be compensated for all of the savings it generates, which will occur over time under the AESO's proposal. (Please note that this comment is based on the fact that the current DCG Credits are based on the bulk and regional tariff and noting that Decision 26090 has not yet been released. However, even in the event that DCG Credits change as the result of that decision, a grandfathering or transitional period may continue to exist and DCG Credits should not be artificially decreased over a transition period based on this five-year average calculation.) **<u>Transition to a five-year average</u>** The AESO should further consider that the transitional period to the use of a five-year average will place increased importance on the ability to avoid a 12CP charge in the first few years of the new rate design. In the first year, the January 12CP charge will be based 100% on consumption during that time period. In the second year, the January 12CP avoidance from the first year will count for 50% and the January 12CP avoidance from the second year will count for 50%. In this way, while the steady state use of a five-year average will have each month count for 20% of a charge five times (20% x 5 = 100%), the months in the first year will be weighted much higher (100% + 50% + 33% + 25% + 20% = 228%). As a result, failure to respond to a 12CP hour in the first year of this new rate design will have much more significant financial impacts than failure to respond to a 12CP hour in later years. The AESO may wish to consider a different transition mechanism under which the first year isn't so strongly weighted. One such option would be to fix the value of previous years at 20% from the beginning, *i.e.,* in year 1, year 1 is 100% but in year 2, instead of 50%/50%, year 1 can be worth 20% and year 2 can be worth 80%. This would lower the value of year 1 from 228% to 180%. Any reduction in the first-year weight would help to lower the cost and risk of failure to avoid all net imports during a 12CP hour in the first year.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021 through April 15, 2021	**Contact:**	Dale Hildebrand
Comments From:	Dual Use Customers (DUC)	**Phone:**	403-869-6200
Date:	2021/04/15	**Email**:	dale.hildebrand@desiderataenergy.com

Instructions:

3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable. It would be helpful to have the AESO provide some additional information, including: • The DUC does not understand the non-standard 12 CP ratchet rate design that gives the initial years greater relative importance. We are also interested in understanding how this calculation will translate through DFO rates. • Information to support the assumption that 31% of Alberta's bulk and regional transmission costs are energy-related and were incurred to facilitate in-merit energy flows. We would like to review a cost of service study to understand the underlying conditions that changed and consequently created the impetus for a significant shift in cost allocation. • Information to support the efficiency of a much larger energy-related allocation. Charging energy on a flat $/MWh basis gives equal weight to all hours of the year, even off-peak hours when the loading of transmission lines is typically at its lowest. A more efficient solution would encourage additional consumption when transmission lines are not heavily loaded. • Information and analysis that identifies what has changed on the bulk transmission system since the last cost of service study was approved by the AUC that would justify the proposed change in rate design.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable. It would be helpful to have the AESO provide some additional information, including: • Providing impacts for customers who are connected through DFOs. DUC recognizes that the AESO does not have control over DFO rate design; however, the vast majority of customers pay their transmission bills through DFO rates. Without understanding the translation of the AESO proposed rate design through the DFO rates, customers are not able to see what their impacts will be. In a vertically integrated utility, customers would understand their impacts. Alberta's electricity system needs to provide the equivalent information to its customers.

3.	Are you supportive of the AESO's preferred rate design? Why or why not?	At this point, DUC has some major concerns with the proposed rate design, specifically the proposed ratchet for bulk system demand charges.
	Questions	**Stakeholder Comments**
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	a) Without reviewing a cost of service study, it is difficult to weigh in on Cost Responsibility. b) It would be useful if the AESO could explain how adjusting the rate design in a way that benefits lower load factor customers and penalizes higher load factor customers, is improving the objective of sending appropriate and efficient price signals. c) Without mitigation, it appears that 7 or 8 customers will see significant disruption and significant impacts to their business. In addition, many other customers will see cost increases up to 10% because of this rate design. Over time, the proposed 12 CP ratchet may impose larger price increases. It would be useful for the AESO to conduct analysis on the economic impacts to the impacted customers. d) Charging on CP, energy or billing / contact capacity are all fairly simple. However, the proposed 5 year trailing average CP is not simple or well-understood. It would be helpful for the AESO to provide an example so customers can understand how it works and the impact this rate design will have on cogeneration customers over time. e) There will be opportunities for innovation and flexibility for some customers, but not all customers.

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	It is difficult to understand why the AESO persists with a major tariff change at this time. Customers are still in a global pandemic, with significant other priorities to attend to. There are also many outstanding issues that have not been resolved that will ultimately impact the ISO tariff causing further revision, including: • The Transmission Regulation being re-examined by government by the end of 2021 • Government changes related to self-supply and net-export expected in the spring of 2021 • AUC changes resulting from the Distribution System Inquiry (such as aligning transmission and distribution rates). • AUC changes to sub-station fraction and DCG credit issues. The AESO should work with both the DOE and AUC to resolve the issues impacting the tariff, prior to changing the tariff. The timing for a change is pre-mature. Customers do not want to see two major tariff overhauls in short order.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	Retaining the 12 CP charge is an area of alignment; however, the volume of the charge and the proposed ratchet are not. The CP allocation method is the standard, FERC-approved allocation method for network transmission costs and it is the established allocation method for bulk transmission costs. Energy-related allocation of transmission costs are not widely used. The AESO needs to explain why Alberta is so unique as to require a different allocation method from other jurisdictions.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	As stated above, more information is required to understand the 5-year trailing average CP data, as well as impacts on DFO rates.

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Modernizing DOS so that it is used efficiently is a worthy goal. DUC will need to see more information on the proposed costs prior to weighing in on whether it will be suitable. If the costs are too high, it will not be used – and hence it will not be suitable.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Fundamentally, the cost is too high, and the terms are too limited. Proponents cannot finance ES projects, for example, based on the availability of term DOS. This is a concern for consumers in that these types of projects could bring value to customers. We need to improve our use of the existing transmission system. The test should be: Does this add value to consumers?
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	DUC submits that if the targeted engagement approach does not result in mitigation options that will keep the customers expecting major cost impacts operating in Alberta, then the AESO should consider delaying and revising the tariff. At a high level, this tariff "modernization" looks like targeted cost increases on price responsive load and high load factor customers. These are the customer groups that have been actively managing their risk – all the while telling the AESO not to overbuild the transmission system in Alberta.

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	Providing distinct tariff treatment for some customers is sub-optimal. Ideally, Alberta would have a transmission tariff that works for all customers. However, we do not want customers to leave the province and increase transmission costs for all other customers in doing so.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	No comments at this time.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	As stated above, ideally, Alberta would have a transmission tariff that works for all customers. However, we do not want customers to leave the province and increase transmission costs for all other customers in doing so. At this point, DUC reserves judgement on mitigation options.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Yes. DUC is very concerned that over-contracting is leading to transmission over-build. Allowing a contract reset period would help alleviate this concern.

15	Do you have any additional implementation considerations the AESO should consider?	No comment at this time.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	See comments above.
17	Additional comments	DUC thanks the AESO for facilitating the March 31st Technical Information Session and for providing customers their Site Data Input directly. This has been a drastic improvement over the analysis for the Bookends.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Mark McGillivray
Comments From:	ENMAX Corporation			**Phone:**	
Date:	2021/04/14			**Email**:	MMcGillivray@enmax.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The update provided by the AESO was valuable for stakeholders to hear which rate design option it preferred and reasoning for the change in approach. We look forward to written explanations during the regulatory proceeding. It may be more beneficial to stakeholders if the AESO held a separate session to discuss possible rate design options for energy storage. See response to Question 8.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was useful to understand how the AESO's bill impact calculator works.

3.	Are you supportive of the AESO's preferred rate design? Why or why not?	ENMAX is evaluating the AESO's preferred rate design and its potential unintended consequences. In general, ENMAX reiterates its views that major changes to the existing tariff design are premature at this time without knowing the plan for changes to the *Transmission Regulation* which may provide new tariff options for the AESO to explore. Future changes to the transmission policy and regulation could help facilitate a more efficient and fairer rate design than what the AESO is currently proposing, and implementing changes now only to revisit the tariff design in the near future would not be in keeping with a number of the AESO's overall design objectives.
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	See response to Question 3.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	See response to Question 3.

6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	See response to Question 3.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	See response to Question 2. While the assumptions used to forecast future rate impacts appear reasonable, they are subject to change over time. The AESO is using 2019 hypothetical rates linked to actual historical billing determinants and there is no guarantee that this will reflect the future. Further, the AESO's rates which are not expected to come into effect until sometime in 2023, are not reflective of the future revenue requirement.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Modernizing DOS may be a suitable option for an energy storage charging capacity; however, there are limitations to the usefulness of such a rate depending on how the eligibility criteria and costs are to be applied. If DOS is used, the AESO should not have the ability to take direct control over the storage asset (outside of a system constraint) in the modernized DOS structure. The availability for a non-firm interruptible rate over the long term (e.g., not confined to a renewal every 12 months) may be worth exploring. If interruptible tariffs are contemplated for energy storage facilities, such rates should remain technology agnostic and must be equally applicable to other facilities and customers that can meet the interruptible conditions. It should also work for various sized storage facilities (e.g., less than 1MW to greater than 100 MW). As noted above, a separate session to discuss possible rate design options for energy storage would be useful. It is important to note that the potential for changes to be made to the transmission policy and regulation could also help facilitate proper rates for energy storage.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	See response to Question 8.
10.	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	It is understood that these conversations will be limited to a few select customers and not be transparent to the marketplace. ENMAX would suggest that a summary

		be made public that includes mitigation outcomes prior to the AESO's filing to the AUC.
11.	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	See response to Question 3.
12.	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	No comment.
13.	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Any mitigation action that shifts costs with any significance would not be appropriate.
14.	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON	No comment.

	waiver if the contract level has not changed in the previous five years?	
15.	Do you have any additional implementation considerations the AESO should consider?	See response to Question 3.
16.	Do you have additional clarifying questions that need to be answered to support your understanding?	No comment.
17.	Additional comments	A noted above, ENMAX is still evaluating the AESO's preferred rate design and its unintended consequences, one of which includes grid defection. With the potential for grid defection to be a rational cost avoidance action by large consumers, does the AESO have a view on what quantity of defection is acceptable to the AESO as a result of this preferred tariff approach? Is there sensitivity analysis available to look at tariff rate impacts if certain levels of defection are realized?

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	EDTI found the session valuable.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	EDTI found the session valuable.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	EDTI is generally supportive of the AESO's preferred rate design however has some reservation about the increased energy-based charges. It's not clear to EDTI how energy-based charges reflect use of transmission infrastructure.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	EDTI generally believes that the preferred rate desing has met the AESO's stated objectives.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	EDTI has no comment.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	EDTI is generally aligned witht the AESO's preferred rate design.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	EDTI believes that the AESO's assumptions are reasonable.

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	EDTI has no comment.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	EDTI has no comment.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	EDTI has no comment.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	EDTI has no comment.

12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	EDTI is not aware of any further considerations.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	EDTI is generally supportive of some type of mitigation for cusomers with impacts greater than 10%. EDTI believes that any mitigation approach will impact other customers in some fashion however this is likely can be managed by use of a transition period for the mitigating measures.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	EDTI supports more flexibility for customers to adjust contract capacity at the time the new rates are iimplemented.
15	Do you have any additional implementation considerations the AESO should consider?	No
16	Do you have additional clarifying questions that need to be answered to support your understanding?	No
17	Additional comments	EDTI has no additional comments.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021 through April 15, 2021	**Contact:**	Justin Rangooni
Comments From:	Energy Storage Canada (ESC)	**Phone:**	647.627.1815
Date:	2021-04-15	**Email**:	jrangooni@energystoragecanada.org

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable for ESC. For energy storage resource tariff treatment, it would have been helpful to include numerical examples for storage treatment. Further, with proposed changes to the DTS rate it would have been helpful to understand how the DOS rate may change as well.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	ESC did not attend
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	ESC is encouraged about the discussion of modernizing the DOS rate; however, there are a number of issues that must be addressed before ESC can be supportive. In particular the increase in metered energy rate by over 300% from ~$5/MWh today for 7-minute DOS to $15/MWh in the future is not supported by ESC.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	No comment at this time
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	No comment at this time
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	No comment at this time
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	No comment at this time

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	ESC is encouraged to see AESO considering an opportunity service for energy storage. ESC firmly believes that the natural operation of energy storage to consume during low demand periods in addition to the benefits of higher utilization of transmission system assets logically concludes with an opportunity service. A modernized DOS rate, or a new firm opportunity service, is required for energy storage resources. By its nature energy storage consumption is opportunistic, the goal is to consume when electricity is cheap and plentiful and return the energy to the market when it is expensive and scarce. If the transmission system is constrained energy storage can stop consuming until the constraint is cleared. The transmission system does not need to be expanded for energy storage beyond connection assets that would be fully funded by the storage facility at project energization. ESC has a number of concerns that must be addressed before the association and its members can be supportive. • The term for DOS rate is limited to 1 year. Energy storage resources operating life is typically 20+ years. The uncertainty of tariff treatment and transmission system access potentially changing on an annual basis significantly increases the risk for energy storage resources. Modernizing the DOS rate must include a longer term. ESC has a preference for indefinite treatment over the life of the asset. • Most energy storage technologies can respond faster than the current 7-minute service. The AESO should offer a DOS rate with a shorter interruption time to reflect the capabilities of energy storage resources. The AESO could also consider combining the shorter interruption with control to force interruption as part of accepting the rate. • The preferred rate design increases the rate for Metered Energy by over 300%. The AESO is suggesting that the DOS rate would increase by the same amount. Based on how energy storage resources will use the system during unconstrained hours ESC is not supportive of such a steep increase. A fair opportunity service would have a consistent rate treatment that represents the minimum costs of the transmission system. Further, the treatment does not reflect cost causality principles. Energy storage will not drive transmission system expansion. • A core benefit of energy storage resources is the flexibility of operation. Energy storage resources do not require firm capacity service on the transmission system and should be offered a less firm system that

		leverages that flexibility for the benefit of the broader Alberta transmission system. Modernizing the DOS rate should be used to encourage utilization of existing transmission system assets during low usage hours while at the same time using the interruptibility of energy storage (and other loads) to stop consumption when the transmission system capacity becomes constrained. • Currently, DOS service is offered in addition to an existing DTS service. AESO stated during Session 5 that it expects energy storage to have a DTS rate for station service and other consistent demand requirements. ESC is supportive of this approach but requires the details on how the AESO would determine eligibility for DOS versus DTS for an energy storage resource. • Eligibility for the DOS rate is based on transmission capacity availability. AESO stated during Session 5 that the assessment of transmission capacity availability is technology agnostic. ESC would like to confirm that the DOS rate eligibility would assume as an input consumption during off-peak hours for energy storage resources. Further, as an opportunity service there is risk transferred to energy storage resources through potential interruption if the transmission capacity becomes constrained when they want to consume. Eligibility criteria related to available transmission capacity should be low given the risk assumed by energy storage resources. • Finally, it is not clear how the AESO will treat energy storage used for system balancing services (e.g., regulating reserve). In the previous bulk & regional tariff sessions the AESO has discussed offering an exemption for energy storage providing ancillary services to the Alberta electricity market. Further, energy storage used as an alternative to transmission has not been discussed. ESC is interested to understand if a different rate or potential exemption for tariff charges may be considered for energy storage resources offering ancillary services or as an alternative to transmission. Clarification of treatment for both service types is needed.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Please see comments above
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	No comment at this time
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	No comment at this time
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	No comment at this time

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	No comment at this time
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	No comment at this time
15	Do you have any additional implementation considerations the AESO should consider?	As mentioned, AESO should consider a shorter interruption period for a modernized DOS rate to benefit for energy storage attributes.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	Energy storage treatment in the tariff presented by AESO suggests modernizing the DOS rate. At this time, there are many details about the modernized DOS rate that has not been provided. ESC is interested to know if the AESO will provide a timeline for when modernization details will be issued for stakeholder review.
17	Additional comments	ESC is encouraged by the direction of the AESO is taking but believes there is significant work to still do before a finalized rate design can be established.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	FortisAlberta found the session helpful in that it provided an opportunity to hear the issues and concerns from the perspectives of end-use Customer groups. As well, the AESO's presentation of potential bill impacts to low versus high load factor PODs, as a result of the AESO's preferred rate design, demonstrated the potential for a resultant cost shift from low load factor to high load factor consumers and rate classes as a result of recovering the energy-classified transmission costs through an energy charge to be applied to all energy consumed.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	FortisAlberta observes that Technical Information Session II was valuable in that it allowed large consumers, who receive service directly via a dedicated connection to the transmission system, in assessing the potential bill impacts of the AESO's preferred rate design on their particular POD, but did not provide any insight into how the mass market (distribution-connected customers and rate classes subject to the distribution tariffs) might be impacted if the preferred rate design were approved and flowed through the distribution tariffs based on the transmission cost allocation and rate design methods as currently approved by the Commission.

	Questions	Stakeholder Comments
		To this end, and in response to a customer request, FortisAlberta subsequently provided its Analysis of Estimated Bill Impacts to FortisAlberta DT rate classes / Customers of AESO Preferred DTS Rate Design, which the AESO has now posted to the AESO's stakeholder engagement website. (Note: This document was prepared by FortisAlberta Inc., not the AESO, and is subject to the Disclaimer included in the document.)
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	While FortisAlberta is generally supportive of the AESO moving away from recovery of transmission costs through 12 CP (proposed to reduce from 47% to 29%), the Company is not supportive of recovering the energy-classified costs (proposed to increase from 7% to 31%) as a flat energy charge applied to all energy consumed. FortisAlberta's concerns are two-fold: (1) From the preliminary bill impact analysis, the proposed flat energy charge, applied to all energy consumed, creates a directional cost shift from low load factor to high load factor consumers, who are arguably making more efficient use of the existing transmission. As such, the AESO should advise stakeholders whether this resultant cost shift (on day 1) was intentional, and if not intentional, the AESO should consider rate design alternatives (for example, a load factor declining energy block structure as suggested by FortisAlberta) to mitigate this shift. (2) FortisAlberta considers that recovery of all energy-classified costs via a flat energy charge applied to all energy does not reflect cost causation generally, and does not send an efficient price signal to consumers to make the most efficient use of the transmission system as currently built (i.e., rather, the flat energy charge applied to all energy consumed provides a price signal that disincentivizes customers to improve their load factor even if the incremental energy is consumed in off-peak hours and does not require an increase to the customer's DTS capacity). In the Company's view, this may have the unintended consequence of driving further grid defection by high load factor consumers and further erosion of DTS billing determinants, which of course is one of the main concerns with recovery of transmission wires costs based on 12 CP.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	a) With respect to the objective of **Reflecting Cost Responsibility** (or Cost Causation), FortisAlberta observed that the AESO has reduced the weight given to the allocation of 12 CP in its rate design and agrees that that the recovery of wires costs based on some form of a monthly NCP billing determinant is more reflective of cost causation than any 12 CP rate design can convey. This assertion is grounded in the physical reality that any wires element (whether it be at transmission or distribution voltage, or whether it is a power line / cable, switch, bus or transformer) must, at minimum, be planned and built to accommodate the maximum NCP flowing through the wires element, irrespective of the time that that maximum flow occurs. With respect to the energy charge proposed in the AESO preferred rate design, please refer to our response to question 3 above. b) With respect to the objective of providing **Efficient Price Signals** (i.e. sending price signal to alter behavior to avoid future transmission build), FortisAlberta considers that the use of 12 CP, while it provides a signal that larger sophisticated Customers can respond to, is not necessarily an economically-efficient price signal for purposes of altering Customer consumption behavior for purposes of avoiding future transmission build. Further, while FortisAlberta understands that part of providing efficient price signals is providing a signal that Customers can meaningfully respond to, the form of the price signal or billing determinant(s) should not allow Customers to avoid costs for which they should be responsible for, which is possible under the 12 CP structure. Therefore, FortisAlberta supports the reduced weight given to the allocation of 12 CP in its rate design. With respect to the energy charge proposed in the AESO preferred rate design, please refer to response to question 3 above. c) With respect to the objective of ensuring **Minimal Disruption** (i.e., Customers that have responded to the 12 CP price signal and invested to reduce transmission costs are minimally disrupted), CP-responsive loads, who have been responding to the currently approved 12 CP rate structure for over 15 years, should not be severely impacted by any abrupt change to the tariff structure. Allowing a gradual transition to a rate structure that reflects cost responsibility and provides economically efficient outcomes for the development of the transmission system would promote rate stability and allow such Customers to plan their operations to gradually adjust to responding to the new target rate structure / price signals over a reasonable time period. With respect to the energy charge proposed in the AESO

	Questions	Stakeholder Comments
		preferred rate design, please refer to response to question 3 above. Further, FortisAlberta submits that rate design objective of Minimal Disruption might be better achieved or enhanced if the AESO considered alternative rate design alternatives for the energy component of its tariff (for example, a load factor declining energy block structure as suggested by FortisAlberta). d) With respect to the objective of **Simplicity** (i.e. simple/clear price signals while achieving design objectives), FortisAlberta recognizes that the proposal to gradually shift from 12 CP to NCP and increase the weight given to the energy component for allocation purposes is easy to understand, however, recovery of the energy-classified costs through a flat energy charge applied to all energy consumed, while simple and transparent, it does not send an efficient price signal in terms of incenting customers to improve their load factor this optimizing their use of the transmission system and their respective DTS contract capacity. e) With respect to the objective of **Innovation and Flexibility** (ISO tariff provides optionality for transmission Customers to innovate while not pushing costs to other Customers), as the grid continually evolves with the addition of DERs, FortisAlberta considers that the AESO's proposed rate design structure could be refined by the AESO over time to provide a level of innovation and flexibility for Customers. This could include further expansion of opportunity (i.e. such as DOS), interruptible and load attraction rates to maximize and/or optimize use of the existing system. Such optional rates beyond the base DTS rate would allow for improved efficiency or Customer use of the system while recovering additional contributions towards revenue (which would be to the benefit of all ratepayers). With respect to the energy charge proposed in the AESO preferred DTS rate design, FortisAlberta submits that if the AESO considered alternative rate design alternatives for the energy component of its tariff (for example, a load factor declining energy block structure as suggested by FortisAlberta), additional opportunity in innovation and flexibility for customers could potentially be built into the AESO base DTS tariff.

	Questions	Stakeholder Comments
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	FortisAlberta provides the following additional comments for consideration: • With respect to a preferred rate design, FortisAlberta provided comments on November 20, 2020, partially repeated here for convenience. FortisAlberta's preference is for whatever target rate design the AESO ultimately proposes and implements, that all Customers are treated in a transparent and consistent manner and subject to the same tariff(s). That is, FortisAlberta's preferred option of gradually transitioning to a load factor rate structure does not favor any specific Customer groups and is aimed to encourage Customers to avoid over contracting demands and maximizing or optimizing their hourly use of their contract capacity (i.e., improving load factor), so the grid can be utilized more effectively and developed in an orderly, economic, and efficient manner. As such, rate structures that generally incent Customers to improve their load factor and optimize the use of the existing system, such as load factor or on-peak period rates, align with the principle of economic efficiency and should, therefore, be considered in the future development of transmission and distribution (wires) rates in Alberta. This load factor rate structure, or sometimes known in industry as the "Wright" rate, is structured to apply an energy charge ($/MWh) for all energy delivered up to a minimum load factor (or hours usage), and a reduced (or zero) $/MWh charge for all remaining energy (MWh) consumed above that threshold load factor. For example, this structure could be expressed as: – 1st Energy Block: For the first XX MWh / month / MW of Billing Capacity: a charge of XX $/MWh – 2nd Energy Block: For all additional MWh: a reduced (or zero) $/MWh charge. This load factor component rate structure (with a low minimum floor load factor for the 1st energy block, and a reduced (or zero) price for any energy in the remaining block) could be used for recovery of the energy-classified portion of total Bulk and Regional costs. For more information on the "Wright" rate, please refer to the book entitled *Electricity Pricing, Engineering Principles and Methods* by Lawrence J. Vogt P.E., pages 597-601.

	Questions	Stakeholder Comments
		• With respect to simplicity and transparency, the AESO may want to reconsider the CP rate structure that require five years of billing data to calculate the current month's billing determinant for any POD or customer, as in FortisAlberta's view, this creates an unnecessary level of data and complexity to administer with no real offsetting benefit identified for doing so. That is, the current DTS rate design employs a two-year 90% ratchet provision to calculate DTS billing capacity, and therefore the Company recommends that the AESO not consider use of billing determinants or measurement data beyond two years prior, for purposes of establishing its CP billing determinant in any given month.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	Please refer to our responses to questions 3 and 4.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	For purposes of this consultation the assumptions used by the AESO appear to be reasonable, however, it is unclear to FortisAlberta why the AESO used a recalculated tariff based on its 2019 revenue requirement for purposes of assessing the rate impacts.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Yes, DOS should be available to energy storage. That is, FortisAlberta is not supportive of developing specific rates for specific end uses (including energy storage) given that from a wires costs perspective, energy storage shows up to the system as either supply or demand, no different than a dual use customer who has both supply and demand requirements at their point of interconnection with the AIES. If energy storage requires service on a firm basis then the DTS rate is available to them for purposes of serving their charging cycle just like any other load market participant and if energy storage seeks service on an opportunity (non-firm) basis then DOS is available. With respect to DOS eligibility requirements FortisAlberta is supportive of the AESO's review and modernization of such, for not only energy storage, but for all market participants.

	Questions	Stakeholder Comments
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	With respect to FortisAlberta Rate 65 Customers who periodically make use of DOS, the Company is not aware of any concerns or issues with the current DOS implementation that limit their eligibility or use of excess transmission capacity that may be available at certain PODs.
10.	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	Please refer to our response to questions 4(c) and 5.
11.	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	Please refer to our response to questions 4(c) and 5.
12.	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	No comment.

	Questions	Stakeholder Comments
13.	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	FortisAlberta provided comments on November 20, 2020, partially repeated here for convenience. Through careful analysis and mitigation, the tariff could be developed to evolve gradually in a manner that allows Customers to improve their load factors while not experiencing significant billing impacts. FortisAlberta expects that if the AESO also saw merit in pursuing the load factor structure, that they could analyze the bill impacts from moving from CP to NCP/load factor structure for every POD, and adjust both the weighting of cost recovery between NCP component and the load factor energy component, or adjusting the threshold load factor in the energy component to minimize the resultant bill impacts of the AESO preferred DTS rate design in the first instance. Such an approach, if investigated by the AESO, might obviate, or at least mitigate, the need for further mitigation.
14.	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	FortisAlberta may be supportive of the AESO assessing the ability to provide greater flexibility to adjust contract capacity provided that the AESO can demonstrate in the particular customer circumstances that it does not create a cost shift to other customers. In addition, FortisAlberta understands that, in the first instance, notice provisions are intended to ensure that the AESO's transmission planners have sufficient notice of any changes to market participants' capacity requirements within the typical transmission planning horizon. This ensures that the AIES can be developed in an orderly, economic and efficient manner, and the requirement for a customer to pay PILON is the secondary option if the customer fails to give sufficient notice for any DTS contract reductions.
15.	Do you have any additional implementation considerations the AESO should consider?	Not at this time.
16.	Do you have additional clarifying questions that need to be answered to support your understanding?	As posed by FortisAlberta in AESO Session 5: Rather than recovering the Energy-classified costs through All Energy / hours, did NERA or the AESO consider any Load Factor rate structures (i.e., the "Wright" structure) which sends an economically efficient price signal that broadly encourages Customers to improve their load factor (flatten their load profile), thereby incenting all Customers to make the most efficient use of the existing transmission elements and capacities that serve them, and potentially deferring the need for future transmission? If not, please explain why such a structure has not been investigated.
17.	Additional comments	None.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Scott Perry
Comments From:	Greengate Power Corp			**Phone:**	403-519-6194
Date:	2021/04/14			**Email**:	scott@greengatepower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session provided a valuable platform for stakeholders to pose questions and explore the AESO's tariff design proposal. We appreciate the opportunity to provide commentary and continued engagement.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable and allowed good dialogue between Market Participants and the AESO regarding rate impact.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	Greengate is not supportive of the AESO's rate design for Bulk and Regional Charges. Greengate is supportive of using DOS rates for energy storage if the DOS rate and terms and conditions are appropriately modified. Although, it would be our preference to have a storage-specific tariff acknowledging the unique capabilities and value offered by energy storage, Greengate believes that an interruptible tariff is an improvement to rate DTS. At a high-level, Greengate supports the use of a modernized DOS tariff; however, this support is predicated on the assumption that elements of the existing DOS tariff are modified to facilitate fulsome market participation by energy storage assets. It is our understanding, from the rate sheet provided by the AESO, that Rate DOS charges will increase substantially under the proposed tariff structure. Greengate is concerned that the proposed DOS tariff rate will continue to render energy storage charging from the electricity grid as a broadly uneconomic activity, reducing the positive impact that energy storage could have for Alberta's load customers.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	No, Greengate does not believe that the AESO's preferred rate design meets the rate design objectives. Drastically increasing the energy charge will not lead to a tariff that properly reflects cost responsibility. Grid costs are mostly fixed in nature. Taking a fixed charge and collecting it from AESO customers on a variable cost/MWh basis does not properly reflect cost causation. The AESO constructs transmission facilities based upon an assessment of peak load. Collecting on a $/MWh basis does not properly allocate costs to low load factor customers and is therefore not a rate that is based upon a cost causation principle. DOS rates are heavily influenced by the size of the energy charge. A drastic increase in DOS rates that is proposed by the AESO can only be justified if actual variable costs have increased. The AESO's proposed rate design arbitrarily increases the variable component of the AESO's tariff and therefore is not justified.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	The AESO should collect fixed charges from its customers to reflect the fixed nature of transmission costs. Creating a variable cost from fixed charges does not properly reflect the fixed cost nature of transmission costs. The AESO's rates should be modified to properly reflect cost causation.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	N /A
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	N /A

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Greengate applauds the AESO's acknowledgement that the DTS rate, in its current form, does not support economic charging behaviour of energy storage from the AIES; and the subsequent consideration that non-firm rates could encourage participation of flexible market assets, such as energy storage. Overall, Greengate supports the use of a modernized DOS tariff; however, this support is predicated on the assumption that elements of the existing DOS tariff are modified to facilitate fulsome market participation by energy storage assets. Greengate supports the following eligibility criteria for DOS as listed on slide 74 of the March 25 stakeholder session presentation: 1. "Use would not occur under any other rate". Rate DTS is economically destructive to energy storage participation in the energy wholesale energy market. Energy storage follows price signals to store electricity from the grid when it is economically prudent to do so (i.e. during instances of low Pool Prices). Adding the Rate DTS to the Pool Price renders energy storage asset participation broadly uneconomical. 2. "Must have alternative energy source or a "market opportunity" where the cost of receiving additional electric energy under Rate DTS renders the opportunity uneconomic." Investing in energy storage under Rate DTS renders projects broadly uneconomical. Firm electricity is required for the facility auxiliary loads and thus requires a relatively small Rate DTS contract. However, the incremental grid electricity consumption required to charge an energy storage asset is uneconomical under Rate DTS. Greengate believes that the following DOS eligibility criteria, as listed on slide 74 of the March 25 stakeholder session presentation, require modification: 1. "Sufficient transmission capacity." Ideally, energy storage would qualify for a storage-centric firm service rate, at a much lower tariff rate charge than the proposed Rate DTS and Rate DOS charges. It should be acknowledged that energy storage is capable of providing broad benefits to the Alberta electric system, and subsequently the users of that system (both load and generation). Under the AESO's proposed tariff structure, if an energy storage asset elects to connect to the system, it is understood that Rate DTS contracts take precedence over those contracts for Rate DOS, which are interruptible. Therefore, an energy storage market participant that elects to construct a facility and connect under rate DOS should be permitted to do so using its own assessment of available transmission capacity which would be based upon a

		grid study. The AESO should consider modifying this criterion in the modernized DOS tariff. 2. "Is temporary or repeated short-term use." Most energy storage assets that qualify for the modernized Rate DOS will exclusively use Rate DOS for all charging energy purchased from the grid. This would remain the case unless an alternative rate structure is developed and instituted that better serves energy storage assets, such as a future Energy Storage-centric tariff.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	The following components of the current DOS implementation limit the use of excess transmission, particularly as relates to energy storage: 1. **Determination of Rate DOS Charges**. The existing Rate DOS Charges are based on the "Energy" portion of the AESO Bulk and Regional Tariff. Slide 74 of the March 25 stakeholder session presentation illustrates that the "Energy" portion of the charge was $2.18/MWh (based on the 2019 Test Year), but increases to $10.19/MWh (based on the AESO preferred rate modelling for 2019). This is a 467% increase to this cost element, which happens to be a component for the cost basis for Rate DOS. The AESO's latest tariff rate estimation, made available to stakeholders on April 13th, estimates that the DOS Rate will increase to $15/MWh. This triples the DOS rate, and therefore triples the rate that applies to energy storage grid charging. **Greengate is highly concerned that increases to the DOS 7-minute charge will prove cost prohibitive to energy storage participation in the Alberta electricity grid. Greengate also questions the cost causation basis of drastically increasing the energy charge in the Bulk and Regional tariff.** 2. **Rate DOS Types**. It is our understanding that the existing three Rate DOS Types (DOS 7 Minutes, DOS 1 Hour, DOS Term) were created to serve a certain set of load service considerations, such as temporary provision of excess grid electricity (beyond a proponent's Rate DTS contract) during outage of a load customer's onsite generation. The existing rate DOS types do not reflect the advanced operational capabilities of energy storage, including the ability to satisfy recall directive response times far shorter than 7 minutes. **In modernizing DOS, Greengate recommends that the AESO considers implementing faster responding DOS types (i.e. DOS 1 Second, DOS 30 seconds, DOS 1 Minute).** 3. **Take or Pay Provision**. Energy storge assets will use Rate DOS for charging over the life of the installed asset. Therefore, as far as an energy storage asset is concerned, this is not a "temporary or repeated short-term use" case. **Greengate requests that the take or pay provision does not apply to assets that satisfy the other eligibility requirements to participate in rate DOS.** **4. Eligibility – Economic**. Energy storge assets will use Rate DOS for charging over the life of the installed asset. Therefore, as far as an energy storage

		asset is concerned, this is not a “temporary or repeated short-term use” case. The market participant can certainly indicate it would not increase metered demand under Rate DTS, if Rate DOS was not available, as this would be economically destructive to the energy storage asset.
10	Do you have any comments on the AESO’s targeted engagement approach for mitigation discussions?	Greengate elects to reserve commentary to the suggested energy storage tariff treatment.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party’s transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	Greengate elects to reserve commentary to the suggested energy storage tariff treatment.
12	Based on the AESO’s mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	Greengate elects to reserve commentary to the suggested energy storage tariff treatment.

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Greengate elects to reserve commentary to the suggested energy storage tariff treatment.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Greengate elects to reserve commentary to the suggested energy storage tariff treatment.
15	Do you have any additional implementation considerations the AESO should consider?	Greengate would appreciate further discussions on the DOS rate design, prior to the AESO filing its tariff. To date the DOS concept has only been broadly discussed and a detailed rate sheet and terms and conditions have not been released. Greengate would appreciate an opportunity to comment on the DOS rate details as they become available.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	Greengate is not following the logic of the AESO's proposed DOS rate sheet. A discussion on the DOS rate calculation would be appreciated.
17	Additional comments	Thank you for the opportunity to comment.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021 through April 15, 2021	**Contact:**	Kurtis Glasier
Comments From:	Heartland Generation Ltd. (“Heartland Generation”)	**Phone:**	(587) 228-9617
Date:	[2021/04/15]	**Email**:	Kurtis.Glasier@heartlandgeneration.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Heartland Generation found Session 5 to be valuable. Further comments regarding recommendations to enhance stakeholder engagement efficiency are found in response to question 17.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The Technical Information Session II was valuable, and the focus of this session on using the bill impact tool was particularly useful. Heartland Generation would be supportive of further technical information sessions as the tariff design evolves through the consultation and approval process. Going forward it would be helpful for the AESO to create an archive of the bill impact tools as they are changed and improved, as well as a log of changes as part of the tool itself.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	While there are refinements that will likely be made throughout the consultation and approval process, Heartland Generation is generally supportive of the AESO's preferred rate design. However, Heartland Generation appreciates that this preferred rate design may not be the only rate design in the public interest. Further, the AESO should provide analysis conducted by itself or its expert consultant, NERA Economic Consulting, to support the preferred rate design. The questions submitted by the Alberta Utilities Commission ("AUC") on April 7, 2021 form a good basis for the type of analysis and information that would be helpful to stakeholders. For example, slide 35 of the AESO's presentation is used as a basis for the larger "energy charge" component of the preferred rate design. Heartland Generation may agree with the conclusion that "demand at coincident peak is not the only driver of bulk transmission system utilization"; however, this analysis seems incomplete to conclude that a flat energy charge is the only reasonable billing determinant to allocate the remaining transmission costs.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	Heartland Generation is supportive of the changes to the rate design objective of "Reflect Cost Responsibility" as it now correctly prioritizes cost causation over "benefits". Efficient transmission cost allocation and proper price signaling needs to be grounded in how an individual market participant's utilization of the grid impacts overall transmission costs. The first two rate design objectives (cost responsibility and efficient price signals) should be characterized as the critical design elements, as failure to achieve either of these principles cannot be corrected by meeting the other objectives. Heartland Generation believes it is possible that the preferred rate design meets, or at least is attempting to meet, these two critical design elements. Further analysis and expert evidence would be needed in order to determine whether the preferred rate design meets these rate design objectives. In general, the AESO has identified that demand and energy are both drivers of transmission costs on the system. Therefore, it is entirely consistent with cost causation to allocate the costs of the transmission system according to these relevant cost drivers. In theory, the marginal transmission costs of these cost drivers would produce the most efficient price signals; however, this could result in the incorrect collection of transmission costs.[1] The latter three objectives (minimal disruption, simplicity, and innovation and flexibility) are important from an implementation perspective and, properly applied, will avoid unnecessary rate shock to consumers. The preferred rate design, by maintaining the previous tariff rate design components and billing determinant terminology, appears to meet these implementation objectives. This is exemplified through the materials for Technical Session II, whereby the output of the Bill Impact Tool clearly shows the line item changes between the two rate designs.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	The preferred rate design currently allocates the same transmission signal for the "energy charge" across all hours. In other words, asides from the coincident peak demand hour, transmission is valued at all other hours equally. This finding does not appear to reflect the reality of the transmission system. Heartland Generation appreciates that the transmission regulation details how transmission costs can be allocated (e.g., all regions are allocated the same postage stamp rate). The AESO should explore if there are other ways to assess the energy charge than through a flat charge across all hours. There are likely sets of energy charges that better reflect the value of the transmission system as it varies throughout the day and system demands.

[1] The total amount collected from marginal costs would total less than the total transmission costs, as it is a generally acceptable assumption that marginal cost is less than average costs.

6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	After an initial assessment Heartland Generation believes that the concept of cost causation is theoretically contained within the preferred rate design. An efficient rate design will charge participants according to their impact to transmission costs and should therefore contain efficient price signals.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	At this time, Heartland Generation does not have comments about the AESO's assumptions made in order to assess the rate impact of the preferred rate design.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Heartland Generation is supportive of a modernization of DOS. The AESO should explore the basis of opportunity service products in Alberta from an inclusive perspective (e.g., comparing DOS to intertie opportunity service rates, IOS and XOS). This would ensure alignment between all opportunity service products that currently exist and lay a basis for future opportunity service products. It is important that the AESO design improvements to DOS that are technology agnostic and available to all facilities that qualify, not just limited to energy storage.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	The consultation regarding improvements to DOS should be separated from the tariff design consultation. Heartland Generation believes that stakeholder consultation on DOS, and more broadly on opportunity service rates in Alberta, would be better addressed through a separate consultation. During Session 5, the AESO indicated that there were no explicit linkages between the preferred rate design and the energy storage tariff treatment or DOS modernization. Heartland Generation views these topics as separate and not intrinsically linked. Given the highly contentious nature of the tariff design, a separate consultation for the modernization of the opportunity service rates would be a better way to engage stakeholders on this insulated topic. This would also allow for a targeted discussion and materials to focus on those stakeholders seeking opportunity service and improvements to DOS, this is likely a subset of stakeholders currently involved in the bulk and regional tariff design consultation.

10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	Heartland Generation does not have specific comments regarding the targeted engagement approach for mitigation; it appears logical given that the largest impacts from the preferred rate design will be concentrated on a few participants, for the AESO to work directly with those participants. However, Heartland Generation is curious about the method of approval for mitigation plans and whether this will be through specific AUC approval or whether the AESO will apply to the AUC for broad discretion in its ability to create mitigation plans.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	The AESO may want to consider whether a percentage increase should be the only threshold to access mitigation. For example, a less than 10 per cent individual impact could still be millions of dollars and reasonable to enter a mitigation plan to avoid excessive rate shock. It may be worthwhile for the AESO to include a dollar figure threshold alongside the individual percentage increase.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	At this time, Heartland Generation does not have specific comments regarding the targeted engagement approach for mitigation.

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	In general, Heartland Generation is not opposed to some type of mitigation, on the basis that the mitigation does not create a favorable outcome for those subject to it; by extension, the mitigation plans should not create an unfavorable outcome for the rest of the market by allowing a market participant to entirely avoid paying the just and reasonable rate. Mitigation plans should be used to smooth the effects of a rate design change, not avoid or deter the rate impact entirely.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Heartland Generation fully supports the changes to PILON. This change allows the PILON signal to further align with AESO transmission planning timelines and produces a more efficient outcome. These amendments to PILON should proceed regardless of the bulk and regional tariff design changes. This initiative to align transmission planning with requirements when contract capacity is reduced or terminated will reduce regulatory red tape.
15	Do you have any additional implementation considerations the AESO should consider?	The AESO should consider how to best implement the 5-year trailing average of monthly coincident peak. The current methodology will put an increased significance on the first year that the preferred rate design is implemented; there exists the possibility that the first year of implementation may be an outlier year regarding coincident peak demand. Does the AESO intend to allow for case-by-case mitigation should a participant be able to demonstrate that during the implementation years the evaluation (average of less than five-years) is not representative of expected five-year average?
16	Do you have additional clarifying questions that need to be answered to support your understanding?	Heartland Generation does not have any specific clarification questions at this time; however, the AESO's planned responses to the questions submitted by the AUC on April 7, 2021 will provide valuable insight into the preferred rate design. Heartland Generation is in favor of the AESO responding to these questions prior to filing its ISO Tariff application.

17	Additional comments	The amendments to PILON and exploration of opportunity service rates are distinct issues that does not necessarily connect to the Bulk and Regional Tariff Design. Heartland Generation proposes that these two initiatives should be separated from the overall tariff design consultation, into their own focused stakeholder engagements. Simply put, these issues should be considered separately and should not form a part of the “Bulk and Regional Tariff Design” application to the Alberta Utilities Commission (AUC). It is worth noting that Heartland Generation is supportive of both initiatives, however there is a risk of these topics getting muddled in the more complex and contentious bulk and regional tariff design proceeding. It is recommended that the AESO examine how best to engage with stakeholders now that it has been identified that DOS modernization and changes to PILON are not intrinsically linked to the bulk and regional tariff design consultation. It would be preferred to migrate the work already conducted as part of the tariff design consultation related to these initiatives to separate consultations. These consultations could begin immediately and could be filed with the AUC along a different timeline.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021 through April 15, 2021	**Contact:**	Vittoria Bellissimo
Comments From:	Industrial Power Consumers Association of Alberta (IPCAA)	**Phone:**	403 966 2700
Date:	2021/04/15	**Email**:	Vittoria.Bellissimo@IPCAA.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable. It would be helpful to have the AESO provide some additional information, including: • An example of the 5-year trailing CP calculation. It has been explained, but IPCAA continues to receive questions on how it works and what the consequences will be of giving the initial years greater relative importance. Consumers are also interested in understanding how this calculation will translate through DFO rates. • Information to support the assumption that 31% of Alberta's bulk and regional transmission costs are energy-related and were incurred to facilitate in-merit energy flows. This is a significant change from the previous 7%. Customers would like to review a cost-of-service study to understand the underlying conditions that changed and consequently created the impetus for a significant shift in cost allocation. • Information to support the efficiency of a much larger energy-related allocation. Charging energy on a flat $/MWh basis gives equal weight to all hours of the year, even off-peak hours when the loading of transmission lines is typically at its lowest. A more efficient solution would encourage additional consumption when transmission lines are not heavily loaded. • Information and analysis that identifies what has changed on the bulk transmission system since the last cost of service study was approved by the AUC that would justify the proposed change in rate design.

2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable. It would be helpful to have the AESO provide some additional information, including: • Providing impacts for customers who are connected through DFOs. IPCAA recognizes that the AESO does not have control over DFO rate design; however, the vast majority of customers pay their transmission bills through DFO rates. Without understanding the translation of the AESO proposed rate design through the DFO rates, customers are not able to see what their impacts will be. In a vertically integrated utility, customers would understand their impacts. Alberta's electricity system needs to provide the equivalent information to its customers. • Providing longer-term impacts for customers to understand the forward-looking costs. Historically, the AESO provided a Transmission Rate Impact Projection (TRIP) model that customers used to understand their longer-term costs. This was more in-depth than the Transmission Rate Projection (TRP) that is currently provided on the AESO's website. IPCAA notes that the TRP has recently been updated, which is helpful; however, the last update was in August of 2019. Customers would appreciate much more frequent updates (every six months) and a more in-depth analysis. Significant assumptions need to be made to turn the TRP into forecasted rates. Customers should not have to produce this type of rate forecast individually. IPCAA is happy to discuss and provide additional feedback to the AESO on the Bill Impact Tool. In the interim, the following comments are provided: • As noted during the session, on the Bill Impact Tool, "Annual Average Pool Price" does not change with different years. This should be adjusted. • Load Factor accuracy is a concern. In the AESO calculations, the Load Factor calculation uses the ACTUAL HMD divided by 12 months, creating an average. Using the maximum HMD, instead of the average would result in a higher denominator, and hence a lower load factor. Customers have noted this issue when they are using the "Adjust Load Profile" tab to override their Load Factor data – particularly when they are planning changes to their facilities and want to come up with a more accurate forecast of their potential impacts.

3.	Are you supportive of the AESO's preferred rate design? Why or why not?	At this point, IPCAA has some major concerns with the proposed rate design: • In general, the beneficiaries of the new rate design are low load factor customers who use the system less efficiently. Higher load factor customers are generally seeing additional costs from this proposed rate design. It is difficult to understand how the AESO sees this as an efficient outcome. • In addition, many low load factor customers may have peaks that correlate to the system peak and energy usage that is considerably reduced in off-peak hours, particularly residential loads. Effectively rewarding customers for less efficient use of the transmission system is very concerning. • Allocating more costs to energy on a flat basis is not efficient. HE1 is clearly not the same as HE17. • Increasing the energy charge by $8/MWh will provide a predictable $8/MWh incentive for on-site generation. This could erode billing determinants further. • With regard to impact through distribution rates, at this point we only have information from FortisAlberta, which we thank them for. We do know that other DFOs are working on providing calculations. Our members are particularly concerned that high load factor customers in Fortis Rate 45, Rate 61 and Rate 63 will see increases to the transmission component of their bills. Again, it is difficult to understand how the AESO sees this as an efficient outcome. • It is also concerning that the AESO is expecting customers to weigh in on this rate design when many customers do not know how this rate design will impact them yet. The AESO should be working with DFOs to provide calculators to customers, so that the tariff can be understood. We only have one DFO Estimated Bill Impact information sheet to date. The AESO should consider hosting a Technical Information Session for DFO-connected customers. All Alberta customers deserve to understand the impact on their bills. • Members are concerned with the proposed 5-year trailing CP calculation. This lengthy term will discourage energy efficiency investments and will disincentivize flexibility and innovation.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	a) Without reviewing a cost-of-service study, it is difficult to weigh in on Cost Responsibility. b) It would be useful if the AESO could explain how a rate design that benefits lower load factor customers and penalizes higher load factor customers, is sending efficient price signals. c) Without mitigation, it appears that 7 or 8 customers will see significant disruption and significant impacts to their business. In addition, many other customers will see cost increases up to 10% because of this rate design. It would be useful for the AESO to conduct analysis on the economic impacts to the impacted customers. d) Charging on CP, energy or billing / contact capacity are all fairly simple. However, the proposed 5 year trailing average CP is not simple or well-understood. It would be helpful for the AESO to provide an example so customers can understand how it works. e) There will be opportunities for innovation and flexibility for some customers, but not all customers. There will be an $8/MWh (plus Balancing Pool Charge) incentive for customers to build on-site generation.

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	It is difficult to understand why the AESO persists with a major tariff change at this time. Customers are still in a global pandemic, with significant other priorities to attend to. There are also many outstanding issues that have not been resolved that will ultimately impact the ISO tariff causing further revision, including: • The Transmission Regulation being re-examined by government by the end of 2021 • Government changes related to self-supply and net-export expected in 2021 • AUC changes resulting from the Distribution System Inquiry (such as aligning transmission and distribution rates). • AUC changes to sub-station fraction and DCG credit issues. The AESO should work with both the DOE and AUC to resolve the issues impacting the tariff, prior to changing the tariff. The timing for a change is pre-mature. Customers do not want to see two major tariff overhauls in short order.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	Retaining the 12 CP charge is an area of alignment; however, the volume of the charge is not. The CP allocation method is the standard, FERC-approved allocation method for network transmission costs and it is the established allocation method for bulk transmission costs. Energy-related allocation of transmission costs are not widely used. The AESO needs to explain why Alberta is so unique as to require a different allocation method from other jurisdictions.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	As stated above, more information is required to understand the 5-year trailing average CP data, as well as impacts on DFO rates.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Modernizing DOS so that it is used efficiently is a worthy goal. IPCAA will need to see more information on the proposed costs prior to weighing in on whether it will be suitable. If the costs are too high, it will not be used – and hence it will not be suitable.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Fundamentally, the cost is too high, and the terms are too limited. Proponents cannot finance ES projects, for example, based on the availability of term DOS. This is a concern for consumers in that these types of projects could bring value to customers. We need to improve our use of the existing transmission system. The test should be: Does this add value to consumers?
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	IPCAA submits that if the targeted engagement approach does not result in mitigation options that will keep the customers expecting major cost impacts operating in Alberta, then the AESO should consider delaying and revising the tariff. At a high level, this tariff "modernization" looks like targeted cost increases on price responsive load and high load factor customers. These are the customer groups that have been actively managing their risk – all the while telling the AESO not to overbuild the transmission system in Alberta.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	Providing distinct tariff treatment for some customers is sub-optimal. Ideally, Alberta would have a transmission tariff that works for all customers. However, we do not want customers to leave the province and increase transmission costs for all other customers in doing so.

12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	No comments at this time.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	As stated above, ideally, Alberta would have a transmission tariff that works for all customers. However, we do not want customers to leave the province and increase transmission costs for all other customers in doing so. At this point, IPCAA reserves judgement on mitigation options.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Yes. IPCAA is very concerned that over-contracting is leading to transmission over-build. Allowing a contract reset period would help alleviate this concern.
15	Do you have any additional implementation considerations the AESO should consider?	Has the AESO considered whether the entire rate should be transitioned? Has any analysis been conducted to examine a transition over several years?
16	Do you have additional clarifying questions that need to be answered to support your understanding?	See comments above.
17	Additional comments	Overall, the AESO needs to consider the long-term public interest and whether this rate design satisfies that consideration. Stakeholders deserve to hear from the AESO as to why this change is, in fact, in the long-term public interest of Alberta. If this case cannot be made, then any major changes must be delayed until such a case can be made. IPCAA thanks the AESO for facilitating the March 31st Technical Information Session and for providing customers their Site Data Input directly. This has been a drastic improvement over the analysis for the Bookends.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Robert Stewart
Comments From:	RMP Energy Storage Inc.			**Phone:**	587-920-4833
Date:	[2021/04/15]			**Email**:	Robert.stewart@rockymountainpower.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	RMP is not supportive of the preferred rate design. The DOS rate for energy storage is not new and would apply under current rate design where energy storage is treated as a DTS customer when charging. The uncertainty of the DOS rate is a significant issue. Under the proposed change to the percentage of system cost recovered through an energy determinant the DOS rate increases significantly. The DOS rate calculation does not recognize that the asset using DOS is not causing the system to be built.

4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	a) No, energy storage does not necessarily create additional system build and therefore should not be responsible for the cost of the system. b) No, price signals do not appear to be efficient as, to our knowledge, transmission planning is still completed based on peak demand. c) No comment at this time. d) This appears to be over simplified with no choice for consumers. e) There appears to be less room for innovation and flexibility within the proposed rate design compared to the existing.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	The AESO should consider an energy storage rate or interuptable rate that does not cover the cost of the system as it is not causing system build. This could be based on rate STS or XOM and IOS. Although these were recommended during the consultation as potential options for the treatment of energy storage, they do not appear to have been considered by the AESO.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	RMP agrees that change to the rate design is needed to address the treatment of energy storage.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	How were the functionalization percentages between bulk, regional and energy determined?

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Under the current rate design, energy storage is classified as a DTS customer when charging and therefore would have access to DOS. DOS as it currently stands is not suitable for energy storage due to term, capacity determination uncertainty and with the proposed rate design now system cost allocation as well. It is unclear what modernization of DOS the AESO is referring to. While an opportunity rate for energy storage does make sense, it must be longer term than one year and not cover the cost of the system that the energy storage asset is not causing to be built. An opportunity rate that is interuptable, available until there is a DTS change and does not cover the cost of the system should be considered . In addition, the rate should not cover any operating costs that energy storage can be interrupted faster than the other services react in (e.g. LSSi, supplemental reserves, etc.).
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	System capacity that is not used by a firm load customer should be made available to other users. It is unclear why there should be scheduling or term associated with this for energy storage when the asset is interuptable. There is uncertainty related to how capacity available for DOS is calculated. All energy storage facilities that may be interconnected with the AIES will require some form of long term financing. Because DOS has only a one year term and there is no guarantee that it will be renewed, new projects cannot be financed due to uncertainty as to the long term availability of DOS service and DOS service rates.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	No comment at this time.

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	No comment at this time.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	No comment at this time.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	No comment at this time.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	No comment at this time.

15	Do you have any additional implementation considerations the AESO should consider?	No comment at this time.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	No comment at this time.
17	Additional comments	If energy storage is not provided a reasonable rate there will be less competition within the energy market, reducing the ability of the market to deliver low cost energy. This is particularly important given the increasing carbon prices that will flow through to consumers under a scenario where most generation comes from combustion based generation.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Horst Klinkenborg
Comments From:	Suncor Energy Inc			**Phone:**	(403) 819-7125
Date:	2021/04/15			**Email**:	hklinkenborg@suncor.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Overall the session was helpful. From Suncor's perspective, time could have been allocated better among the topics. More information regarding the need for change and in support of the proposal would have been useful. Additional time discussing DOS and potential other alternative rate classes would have also been helpful. In contrast, too much time was spent on bill impact and mitigation.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The technical session was useful and the right forum to discuss bill impacts.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	There has been insufficient information so far in order to assess the appropriateness of the design. While the overall design may be okay, Suncor has a concern with the flat all-hour energy charge. If these charges were focused in a way that reduces distortion, the overall design might be acceptable.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	Suncor is concerned the proposal does not meet the legislative objectives and at this stage Suncor believes that at a minimum, the flat energy charge would need to be revised.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	Suncor does not believe that energy in all hours should be treated equally under the tariff. Instead, any energy charge would have to be shaped to focus on relevant consumption and avoid providing incentives that distort behaviour.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	So far there has been insufficient information to determine whether the AESO's preferred rate design meets the legislative objectives better than the status quo. Regardles however, Suncor does not believe that a flat all-hour energy rate makes sense. The 5-year average calculation seems unnecessarily complicated and in general does not seem to serve a useful purpose. If the aim is to flatten consumer's bills, than a 60 month rolling average calculation would be more effective than focusing on individual months.

7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	Suncor considers the rate impact information for transmission customers sufficient.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	Suncor has previously supported more variation in rates and considers DOS modernization a step in the right direction. Not all customers have similar needs and in theory efficiency could be gained by offering more diverse service options. As a first step, the threshold requirement that DOS is only available when DTS would be uneconomic should be revisited.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Suncor believe that the premise is wrong. The goal should not be to sell as much DTS as possible and then offer a burdensome DOS product to try and marginally improve utilization of the grid. Instead, a broader variety of products should be considered that results in a transmission system that better meets the needs of customers.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	Rate impact mitigation is a difficult topic. On one hand, it is definitely desirable to retain loads. On the other hand, any reduction in rates/costs for one participant has to be financed through cross subsidies. Given the significant outstanding questions regarding the preferred rate design, a discussion around mitigation seem premature.

11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	See response to 10.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	See response to 10.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	See response to 10.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	If the tariff results in significant changes relative to the existing tariff design, significantly modifies DOS, or introduces new rate classes, flexibility should be provided to allow contracts to be adjusted efficiently without penalty.

15	Do you have any additional implementation considerations the AESO should consider?	
16	Do you have additional clarifying questions that need to be answered to support your understanding?	Suncor has reviewed the questions by the AUC staff and believes that responses to the questions would be useful to be able to better assess rate proposals in general and the AESO's preferred rate design specifically.
17	Additional comments	Given that the *Transmission Regulation* is set to expire by the end of the year, Suncor believes that filing a revised tariff in June would be premature. Consultation should continue but filing should only occur after any potential regulation changes have been taken into consideration.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Mark Thompson
Comments From:	TC Energy			**Phone:**	403-589-7193
Date:	2021/04/15			**Email**:	markj_thompson@tcenergy.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The March 25, 2021 session provided a valuable forum for the AESO to present its preferred rate design and explain its rationale, and for stakeholders to ask questions and express their concerns. The AESO's preferred rate design proposes some of the most substantial changes to the ISO Tariff in more than a decade, which will significantly impact many ratepayers. As such, it would have been helpful for the AESO to have provided more analysis to substantiate its preferred rate design. In particular, TC Energy notes that the AESO provided no analysis on the long-term impact of its preferred rate design. TCE Energy's response to Question #3 below provides more details regarding the analysis that should be conducted.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, the AESO's explanation of the use of the Bill Estimating Tool was valuable. The "override" tab is helpful to allow for the increase/decrease of various billing determinants. The post-session Q & A was also helpful. A more detailed explanation of the 5-year average CMD determination, with example calculations, would have been appreciated.

3.	Are you supportive of the AESO's preferred rate design? Why or why not?	Bulk & Regional At this point in time, there is insufficient information for TC Energy to determine whether it supports the AESO's preferred rate design. As mentioned above, the AESO has not provided an analysis of the long-term impact of the rate design. While TC Energy understands the AESO's rationale for proposing the changes to the rate design, we have some concerns of its long-term impacts. The AESO's preferred rate design would significantly change the price signals to ratepayers, which would impact behaviour over time. TC Energy submits that it is important to understand the extent and implications of these impacts. For example, by shifting a large portion of costs from coincident peak to energy and recovering these costs on a flat basis, this rate design would increase the price signal to loads during non-peak hours and decrease it during peak hours. As a result, TC Energy expects that some energy consumption would shift from non-peak hours to peak hours. How significant would this shift be? Is this consistent with the efficient use of transmission? Will this result in increased or decreased transmission costs over time? Additionally, this rate design may increase the use of behind-the-fence generation to serve load and may degrade billing determinants. Considering the current self-supply and export policies, how will this impact the wholesale energy market? Is this consistent with the efficient operation of the market? Further, some ratepayers will experience significant rate increases. Will this lead to load destruction and if so, what will be the long-term impact to the Alberta economy? Answers to questions such as these are necessary to determine whether the proposed changes to the rate design are consistent with cost causation, support the efficient use of transmission, and are in the public interest. TC Energy also has some concerns with the manner in which the AESO proposes to recover the cost allocation to energy. The AESO's preferred rate design would recover those transmission costs allocated to energy on a flat basis over all hours (i.e., each hour of the day would be charged the same $/MWh amount) . As a result, the price signal for the energy component would be the same during peak hours as non-peak hours and ratepayers with high load factors, including those who do not actively avoid 12-CP, will face significant rate impacts. This seems inconsistent with the efficient allocation of transmission costs. TC Energy recommends that the AESO instead consider recovering the costs allocated to energy on a shaped basis where the $/MWh charge for each hour would vary proportionally with the hourly load levels over the course of a day.

		TC Energy is similarly concerned that the AESO's preferred rate design may significantly increase the charge under Rate Export Opportunity Service (XOS). If so, this could cause Alberta's rates to be far higher than other jurisdictions and forestall exports out of Alberta. Recovering the costs allocated to energy on a shaped basis would help to mitigate these concerns. TC Energy requests that the AESO provide an estimate of the Rate XOS charge under its preferred rate design. <u>Energy Storage</u> The AESO has not yet identified its preferred rate design for energy storage. Instead, the AESO has indicated that it is considering a form of opportunity service such as a modernized Rate Demand Opportunity Service ("DOS") for energy storage. TC Energy supports the use of an opportunity service for energy storage, but notes that there are some elements of Rate DOS that may not be appropriate for energy storage. TC Energy recommends that the AESO not limit its consideration to Rate DOS as there may be more parallels between energy storage and exports regarding the manner in which they use the transmission system. Following the consultation session, the AESO released its estimates of the Rate DOS charges under its preferred rate design. The charge for DOS 7 minutes would increase by almost 200 per cent from $5.48/MWh to roughly $15.45. This could significantly impact the development of energy storage resources in Alberta. Recovering the costs allocated to energy on a shaped basis would help to mitigate this concern.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	For the reasons expressed above, without further analysis from the AESO it is difficult to determine whether or not the AESO has met its design objectives. a) TC Energy requests that the AESO define Cost Responsibility and to describe how this term differs from Cost Causation. b) Further analysis required as described in the response to Question #3 above. c) The AESO has proposed to limit the rate impact to a 10% rate increase. Some ratepayers may not agree that this would qualify as a minimal disruption. d) The AESO's preferred rate design appears to be fairly simple and straight forward. The resulting price signals may not be quite so simple. For example, this rate design implicitly creates a price signal for behind-the-fence generation and may create differing price signals for the same generation depending on whether or not it is behind-the-fence. e) Further analysis required as described in the response to Question #3 above.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	Please refer to the response to Question #3 above.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	TC Energy is aligned with the AESO's consideration of an opportunity service rate for energy storage.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	TC Energy has no comment at this time.

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	TC Energy is supportive of the AESO considering an opportunity service rate for energy storage relative to the status quo. This is consistent with the principle of cost causation since the energy storage assets are expected to charge when the system is not stressed. Modernizing Rate DOS is one potential route to establish an appropriate rate for energy storage. However, it is essential that the new rate recognize the differences between energy storage resources and the loads for which Rate DOS is intended. For example, energy storage resources are likely more flexible and are less likely to be using the transmission system during peak hours. One issue that the AESO did not appear to address during its March 25, 2021 session was whether energy storage would be charged for transmission services while providing ancillary services. It has been previously suggested that energy storage resources be exempt from transmission charges while providing such services. TC Energy recommends that the AESO incorporate this component into any rate it proposes for energy storage.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	<u>Pre-Qualification</u> Market participants are required to pre-qualify on an annual basis to receive system access service under Rate DOS. Energy storage resources are long-term assets and require an assurance that an opportunity service rate (or some other appropriate rate) is available for the life of the asset. Accordingly, annual pre-qualification is inappropriate for energy storage resources. <u>Eligibility Criteria</u> The Rate DOS eligibility criteria appear to be a construct to distinguish which loads should and should not have access to the rate. These criteria consider specific business circumstances under which a load may utilize Rate DOS as opposed to Rate DTS. This contrasts with Rate XOS where exports universally and automatically qualify for the opportunity service. This is reasonable considering that exports utilize the transmission system when it is not under stress and are recalled prior to other loads. Energy storage is expected to utilize the transmission system in a similar manner and could adopt the same recall priority. Rate DOS customers, on the other hand, may use the transmission system when it is under stress. For this reason, the eligibility criteria is necessary for existing Rate DOS customers, but not for energy storage Further, the AESO needs to ensure that there is a level playing field among energy storage assets. Accordingly, any such the Rate DOS eligibility criteria would need to apply universally to all energy storage assets. TC Energy submits that the eligibility criteria is not necessary nor appropriate for energy storage. Rate DOS also requires that there is sufficient transmission capability. TC Energy questions whether this requirement is necessary for energy storage as it would utilize transmission when the system is least stressed and could be recalled prior to other Rate DOS ratepayers. <u>Rate</u> Rate DOS provides three types of demand opportunity service: DOS 7 Minute; DOS 1 Hour; and DOS Term. Under the AESO's preferred rate design the charge for these types would be $15.45/MWh, $22.85/MWh, and $90.09/MWh, respectively. Each type has a different recall response time and recall priority. Given the charges, recall response time and recall priority, DOS 7 minute would likely be the most appropriate for energy storage resources. However, due to the flexibility of energy storage resources, TC Energy recommends that the AESO consider a unique type for energy storage that has a quicker recall response time, would be

		recalled prior to other Rate DOS ratepayers, and with a commensurately lower charge.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	Subject to the comments provided below regarding the AESO's mitigation plan, TC Energy does not object to the AESO reaching out to those parties that would be most impacted by the AESO's preferred rate design.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	The AESO's mitigation proposal appears to apply to only a subset of ratepayers – those impacted by greater than 10 per cent. TC Energy understands that the mitigation would be funded by all ratepayers. TC Energy submits that this conflicts with the principle of consistent application and would be discriminatory. Mitigation measures should be embedded within the rate design and implemented consistently across the rate class. TC Energy suggests that the AESO could instead provide mitigation measures by transitioning to its preferred rate design over a period of time.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	TC Energy has no comment at this time.
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Please refer to the response to Question #11 above.

14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Yes, this would be reasonable considering the circumstances and may help to reduce future transmission costs.
15	Do you have any additional implementation considerations the AESO should consider?	No comment at this time.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	All of TC Energy's clarifying questions are provided in the responses above.
17	Additional comments	TC Energy is concerned that there is insufficient time between now and the AESO's targeted filing date in June 2021 to adequately consult on a new energy storage rate. While the AESO has made some progress, it has yet to determine its preferred rate design for energy storage. Based on the comments above, TC Energy believes that there is still considerable work to be done. Filing this rate in June may unnecessarily require issues to be resolved in a hearing room that could otherwise be resolved through consultation. This would be inefficient. If the AESO decides to maintain its June fiing date, TC Energy recommends that the AESO delay the filing of the energy storage rate until adequate consultation has been completed. Given the complexity of the bulk and regional rate design and that it will likely be more contested, TC Energy anticipates that there would be little to no delay in the regulatory process as a result.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Akira Yamamoto
Comments From:	TransAlta Corporation			**Phone:**	403-267-7304
Date:	2021/04/15			**Email**:	Akira_Yamamoto@transalta.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	**Yes, the session was valuable but releasing the data and analysis that NERA Economic Consulting (NERA) performed along with the presentation would have made the session more helpful.** Session 5 was valuable as the AESO presented its preferred rate design during the session. The new approach is a significant change switching from the allocation of costs from bulk and regional system to a model that allocates based on demand and energy. The changes as a result of this allocation change were significant: • a coincident peak charge that is almost 40% smaller, • an energy charge that is 5 times greater; and • billing capacity is 30% smaller. The session focused on what the proposed changes were and walking through illustration of the perspective to NERA's approach of allocating costs to demand and energy based upon a minimum and actual system calculation. However, there was no accompanying analysis with system data that showed how these costs were allocated according to this minimum and actual system calculation. Even though the AESO posted additional material on April 13, 2021, including a more detailed explanation of the methodology used to classify transmission costs between demand and energy, we still have questions about this approach to splitting out costs. The methodology assumes that the "minimum system" is that required to meet peak load and therefore classifies all associated costs as demand related when regional peak load exceeds peak generation, while infrastructure beyond the minimum system is assumed to support the in-merit flow of energy and therefore deemed as being energy related. Furthermore, the analysis establishes these relationships using non-coincident peak demand and generation which we are concerned does not represent how these flows occur in real life and may not adequately represent how this data is used in transmission planning. TransAlta would like to see the peak load and peak generation data by region (as well as the total cost for each region) and the minimum and actual system estimates used in NERA's calculation. We would also like to see this information over time, which NERA has stated has changed minimally since 2015. While we appreciate the presentation and the billing estimator, given the dramatically different design being proposed stakeholders should be provided the analysis (and relevant data) that NERA performed so that they can be confident that the approach is a fair allocation of costs and consistent with the underlying data.

2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	**Yes, the Bill Impact Tool and the sample site data were helpful. The AESO should develop a DOS Bill Impact Tool.** TransAlta appreciates the efforts of the AESO to help stakeholders understand the impact of the change in rate design through the Bill Impact Tool. It was very helpful to have sample data provided to use in the Rate Tool. TransAlta recommends that the AESO provides a DOS Bill Impact Tool for energy storage providers that may be used to test the associated costs at various levels of recallability (less than 7 minutes) or priority (lowest priority versus the existing DOS rates priority). Notwithstanding the estimating rate calculation tool provided on April 13 includes estimated Rate DOS, we believe that it would be useful for energy storage providers to estimate their tariff costs under the various DOS service that the AESO is considering for energy storage and allow those providers to provide feedback about whether those costs are attractive for energy storage.

3.	Are you supportive of the AESO's preferred rate design? Why or why not?	**TransAlta does not have enough information to determine whether the new allocation methodology is a fair and reasonable way to redesign the bulk and regional tariff rates.** As stated above, we are concerned that the preferred rate design represents a significant change in cost allocation which should only be undertaken if there is sufficient evidence that it is better or otherwise correcting weaknesses in the existing design. While the session explained the new allocation methodology at a very high level and through simplified, illustrative examples, we were not provided any of the data or analysis that would establish that the concepts of a "minimum" system is fair and good approach. For example, a "minimum system" that estimates the transmission system required to meet peak load sounds like an engineering concept but the determination of what the "minimum system" is under the methodology is based upon peak load relative to peak generation. We are unsure whether this regional perspective is truly a fair representation of a "minimum system" at a system level. We ask the AESO to provide more historic data (pre-CTI and post-CTI) as that we can fully understand how this allocation methodology would change with bulk and regional system build outs. We have several questions about this new methodology that we wish the AESO to address: • Is generation adjusted to factor in the capacity factor of the resource or all installed MW accounted for in the same manner (e.g. 1 MW of solar is the same as 1 MW of gas)? • Installed generation capacity is typically greater than demand in order to ensure resource adequacy is met (generation capacity needs to provide a reserve margin). Doesn't this methodology therefore suggest that at a system level (where generation will be greater than demand) the transmission system is always in excess of the "minimum system"? • If a region has a retirement of a generating unit such that it becomes a region that imports power, does that translate into a reduction in the energy charge and an increase in demand charges? (Wouldn't a change in flows indicate greater use of the bulk system and be directionally misaligned with the change in energy charge?)

	Questions	Stakeholder Comments

4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	Cost responsibility & Efficient Price Signals **Is allocating more costs to energy truly following cost causation?** TransAlta has reservations about a design that would increase the costs associated with energy from 7% to 31% and increase the energy charge by 5 times its current level. We question whether so much of the bulk and regional system cost is truly caused by the amount of energy that a customer consumes. At >$10/MWh, the transmission charges will be higher than the energy price in some off-peak hours. We are concerned that such a high energy charge could drive conservation behavior when we should be providing a signal for greater use of the transmission system (i.e., during off-peak hours). Furthermore, the result of the preferred rate design is to shift a greater portion of wires costs from the fixed demand to the energy portion. This energy charge as proposed is intended to reflect the "additional transmission system required to facilitate the in-merit flow of energy". However, unlike a variable cost, the costs associated with the energy charge do not vary with energy usage. In a situation where there was a large build-out of generation outstripping demand, energy charges could increase even higher, signaling to customers to lower demand in a situation where the opposite is needed for cost recovery. It would also be helpful if the AESO explained how the adoption of new technologies - energy storage in particular - would affect the preferred rate design. For example, whether energy storage would be included in the rate calculations as supply or load in the allocation methodology. Minimal disruption & Simplicity TransAlta supports a preferred rate design that is transparent, simple and fair to all customers. The design should be clear enough that a customer can understand how their behavior affects their transmission costs. TransAlta also supports the implementation of mechanisms that identify customers that are negatively affected by the new rate design and supports them in a transition to the new rates. Innovation & Flexibility The preferred rate design does not include additional rate classes (such as interruptible, standby, or energy storage service rates), as communicated to the AUC with its April 30, 2018 motion and to stakeholders in Session #1. Instead, the AESO has suggested that DOS and DTS be applied to storage customers – essentially forcing new uses to fit the current design instead of the reverse. TransAlta would like more explanation about the AESO's rationale for modifying its rate design to introduce the proposed classification step before functionalization, and whether it has considered other approaches to functionalizing costs that may represent the uses of the transmission system.

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	**Modernize the bulk and regional rate design to contemplate greater customer choice and a greater willingness for customers to trade off cost for reliability.** TransAlta maintains that the AESO could better advance the design objectives by innovating the tariff framework instead of modifying the current structure which was designed decades ago. One innovation which would achieve the AESO's rate design objectives would be Load Retention rates. As discussed in Session #1, transmission costs have increased dramatically since 2014, creating a strong incentive for self-supply. Load Retention rates could remove the incentive to avoid transmission costs while supporting the energy-only market design. The AESO should also consider the wider suite of rates not only as a mitigation option but as a basis for a more modernized tariff design that contemplates the wider adoption of energy storage and more options for customers with respect to how their electricity needs are met (customer choice).
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	We understand that the preferred rate design has shifted costs away from the 12 Coincident Peak (CP) and demand capacity allocators and pushed those costs to be recovered through the energy charge. As stated in our response to Question 3 above, we need additional information to fully understand the preferred rate design. While TransAlta appreciates the AESO's efforts to review its bulk and regional tariff design, the preferred rate design appears to shift costs in a different manner but it remains unclear if this is a better, fairer and/or more reasonable design or just a different design.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	TransAlta asks the AESO to provide an impact analysis on the preferred rate design like that presented in Session #1.

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	**The opportunity to modernize the tariff should consider interruptible, standby and energy storage rates.** The AESO stated in its Energy Storage Roadmap that: "In the future, the AESO will ensure that the unique characteristics of energy storage are considered in ISO Tariff applications submitted to the AUC for approval." TransAlta agrees with this objective and supports the AESO's work to arrive at an energy storage rate design that achieves this end. TransAlta supports the consideration of DOS rates for energy storage charging capacity. However, the current structure of DOS which requires the asset to already have a DTS contract appears to be too restrictive. In this regard, the "modernized DOS" appears to be the same DOS which is generally designed to limit the attractiveness of the rate compared to DTS and limits its use to a maximum term of one year. We would prefer that the DOS rate be designed to consider the costs that are truly driven by an energy storage asset and provide discounted rates for energy storage assets that display charging behaviors or interruptibility that limit the assets imposition of system costs. A widely recognized issue with the ISO Tariff is the lack of interruptible rates for energy resources. Energy storage resources have fully controllable load profiles and could be valuable resources to fully utilize existing/surplus transmission capacity in an efficient manner if an appropriate interruptible service rate was created. We fully agree that the AESO should explore tariff mechanisms that reflect the costs caused by energy storage on transmission system and to remove barriers that may impede the participation in the market. **Energy storage assets should not be charged transmission costs when they are required to consume from the grid to respond to over-frequency events.** TransAlta reiterates our recommendation that the AESO modify its transmission tariff such that an energy storage asset that provides frequency response operating reserves is not required to pay transmission tariff when it is dispatched or directed to consume in an over-frequency event. While these are rare and infrequent events, the cost consequences from being directed to consume from the grid by the AESO are material to the energy storage owner.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	**Energy storage rates should reflect an energy resources' fair share of transmission costs as a load consumer as well as recognize the condition of interruptible service the resource owner is willing to accept.** The AESO should develop energy storage rates that reflect the fact that energy storage assets are likely willing to accept a much greater level of interruptibility than existing DOS rates reflect. This is an opportunity to define the cost savings and system benefits that may be achieved if loads were controllable and dispatchable. We are concerned that the increase to the energy charge under the preferred rate design will make DOS less attractive. As stated in our comments on the preferred rate design, we need additional data and analysis to fully understand why the energy charge is increasing by such a significant amount. On its face, we see the increase in the energy charge as conflicting with the overall merit of pursuing DOS as an energy storage rate. Additionally, in Session #5 the AESO suggested that energy storage assets would be required to demonstrate use of excess transmission capacity to qualify for DOS rates. As mentioned above, we question whether forcing energy storage to conform to the DOS framework is approaching the development of an energy storage rate with the right mindset perspective. Furthermore, it would be helpful to clarify whether the concept of "minimum system" might impact the eligibility criteria for energy storage under the modernized DOS. An energy storage facility that charges exclusively from the grid will require some level of firmness in transmission capacity but that does not negate the value that its interruptibility may provide in terms of the costs of providing transmission service. At a minimum, the AESO's rationale adds a layer of complexity, uncertainty and cost for energy storage assets. **The energy storage rate should provide framework for all energy storage resources.** We note that there are many types of energy storage and not all energy storage types will choose the same rate option. We believe that creating a rate design that is flexible from an applicability, terms, and eligibility criteria perspective and factors in interruptibility (i.e., allows for a customer to trade off cost and reliability) will help modernize rates to accommodate a wide variety of technologies. In creating these rates, the AESO should consider how interruptiblility can be factored into system planning, the value of developing a system in which customers can select lesser reliability, and how the rate could be developed while providing energy storage proponents sufficient information to estimate their curtailment risk. Additionally, we would support the AESO providing information about how it considers energy storage in planning studies as requested by the AUC.

10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	**The objective for any mitigation scheme should be undue hardship on customers and avoiding the loss of customers as a consequence of adopting the preferred rate design.** TransAlta agrees that the AESO should approach the mitigation discussion in a targeted engagement. While some customers have been engaged in the bulk and regional tariff design work, there will also be many customers that have no awareness at all of the proposed change. We support the implementation of mitigation mechanisms particularly at this time (given the pandemic) and agree that flexibility is required to relieve customers from additional financial hardship. The AESO should be mindful that the costs of the existing transmission systems are already sunk and there is a significant risk that the preferred rate design could deter the efficient utilization of those system assets.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	TransAlta generally agrees with AESO's starting principles for mitigation. We would like to further understand how the AESO will conduct targeted engagements with customers, communicate with other stakeholders the consistent application of mitigation, and ensure that the mitigation that is employed is mutually acceptable.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	TransAlta would consider all rate mitigation options such as phase-ins or bill impact options be temporary while mitigation options such as new rates such as interruptible/opportunity rates could be permanent features of a new design.

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	TransAlta supports the AESO's efforts to help transmission customers mitigate the impact of the preferred rate design. We would assess the acceptability of a proposed mitigation approach based upon customers' interest in the approach as well as its ability to retain customers and maximize the efficient utilization of the existing system.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	TransAlta supports the implementation of a contract reset period in which the PILON is waived with the implementation of new rates. This is a challenging time for businesses in Alberta, which are managing the impact of both the economic recession and COVID-19 and may not be focused on managing their electricity bills. We suggest that the contract reset period be open for a period of time such as a year (rather than a short transition period) to provide all market participants sufficient time to see and understand the tariff impact and provide a fair opportunity respond by adjusting their contract capacity.
15	Do you have any additional implementation considerations the AESO should consider?	No additional considerations for the AESO to consider.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	As stated above, we request additional data and analysis to fully understand the allocation methodology.
17	Additional comments	TransAlta supports the AUC's requests for additional information. We believe that the data, analysis and information requested is relevant and would help stakeholders to better understand the potential impacts of the preferred rate design. It would be advisable to confirm that the AESO intends to respond to these questions and by what time, and that the answers will be made public in order to give all participants the opportunity to assess them.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021 through April 15, 2021	**Contact:**	Kipp Horton
Comments From:	Turning Point Generation (TPG)	**Phone:**	403 233-2259
Date:	April 15, 2021	**Email**:	Kipp.horton@windriver.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, TPG appreciated the session to further explore appropriate tariff treatment of energy storage resources. The session would have been more valuable if there was greater analysis provided on the DOS rate as the AESO's preferred tariff treatment of energy storage.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	No comment.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	TPG is supportive of the AESO's general direction to treat energy storage as an interruptible/opportunity service. Although this an encouraging step forward, TPG believes there is more analysis to be done before TPG can support the AESO's current preferred rate design related to energy storage. A "modernized DOS" may or may not be the most appropriate treatment upon completion of additional analysis.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	No comment at this time.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	No comment at this time.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	TPG is aligned with the AESO's direction to treat energy storage as an interruptible/opportunity service.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	No comment at this time.

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	TPG is supportive of the AESO's general direction to treat energy storage (ES) as an interruptible/opportunity service. Although we are supportive to explore the potential of a modernized DOS rate, TPG recommends equal exploration of other potential solutions. On the surface, it appears that a modernized DOS could be suitable but TPG has concerns that many details have yet to properly assessed. For example, there needs to be recognition of the differences between energy storage resources and the loads for which the DOS rate was originally intended. Our major concerns relate to; • Term – the current DOS rate is limited to 1 year. If applied to energy storage, TPG believes that this very short term will create excessive administration burden for the AESO while providing the ES market participant with insufficient planning certainty. • Ancillary Service (AS) – the AESO has previously indicated that energy storage should be exempt from transmission charges while providing AS. No mention of this exemption appears in the preferred rate design. • Metered Energy – it appears that the preferred rate design will see a very large increase in the rate assessed for metered energy. Furthermore, this increased metered energy rate will be assessed on a "flat" basis. The unique nature of energy storage's natural operation means typically charging during unstressed system times. Therefore, TPG believes it is more appropriate to assess energy storage on a "shaped" metered energy basis to reflect cost causality principles. • Eligibility – TPG is concerned that the DOS rate eligibility criteria may impose an inappropriate amount of uncertainty for ES applications. While acknowledging that the AESO's proposal is to modernize the DOS rate for ES purposes, an important aspect should be to avoid the requirement of any ongoing assessment of individual ES market participants' business case, and instead adopt a universal and automatic qualification of ES eligibility. TPG believes that this approach maintains the principles of FEOC and technology neutrality.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	Please see above comments to Item #8.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	No comments at this time.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	No comments at this time.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	No comments at this time.

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	No comments at this time.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Yes, TPG is a strong supporter in general of increased flexibility to adjust an asset's rate class ,contract capacities and reset periods. This flexibility may help to reduce future transmission costs. In particular, more discussion is required to understand the potential interdependencies between DTS/DOS for ES market participants relating to station service, etc. as was recently highlighted by the AESO. Increased flexibility may help to mitigate any potential unintended consequences.
15	Do you have any additional implementation considerations the AESO should consider?	Nothing further at this time.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	At this time, there are many details outstanding regarding the preferred rate design for energy storage. TPG would like to understand AESO's proposed timelines for further consultation on these details and the significant work involved.
17	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Megan Gill
Comments From:	Utilities Consumer Advocate			**Phone:**	403.819.5383
Date:	[2021/04/15]			**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	This session was generally helpful for the UCA.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	This session was generally helpful for the UCA in understanding the AESO's bill impact tool and how the proposed tariff changes will affect both rural/urban residential and small business consumers. In future sessions, it may be helpful if the AESO is able to coordinate with distribution companies to incorporate both distribution and transmission rates in a way that would provide load customers with a comprehensive understanding of the total impact of the proposed tariff changes. This session provided valuable insight into the expected bill impacts in the near-term, however, it would also be helpful to understand the estimated bill impacts for customers over the long term. For example, if more behind-the-fence generation is installed to offset the energy component of the tariff for some load customers, what will the impact be for different customer classes that are not able to install behind-the-fence generation? This analysis and information is needed to more fully understand the impacts and sustainability of the AESO's preferred rate design.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	The UCA sees the current rate designs as an improvement from the existing tariff, as it aims to address the pressing need to better address transmission cost causation and with minimal disruption to existing customers. However, the UCA has concerns with some aspects of the design as it will not fully address the issue of system bypass/cost avoidance and cross-subsidization. In fact, over the longer term, the preferred rate design may exacerbate this issue if a higher portion of costs are recovered from energy (bypassable) charges and not fixed charges. The UCA is concerned this would impede long term sustainability of the grid and negatively impact customers that are unable to bypass the system. See UCA's response to question 4 below for further details.

	Questions	Stakeholder Comments

4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	The UCA sees the current rate designs as an improvement from the existing tariff, as it aims to address the pressing need to better reflect transmission cost causation and with minimal disruption to existing customers. However, we have concerns that it may not meet the objectives in the long-term for the reasons stated above and below. The AESO's proposed design of recovering more costs through energy charges does not fully reflect cost responsibility, as the costs that are being recovered are mostly fixed costs and should not be avoidable. Furthermore, the UCA recognizes that there is a need for legislative amendments (outside the scope of this consultation) in order for the AESO to propose a rate design that more fully reflect cost responsibility by allocating transmission costs associated with the facilitation of in-merit energy to generators. UCA believes the value of being connected to the grid should be reflected in the AESO's rate design so that all connected load pays a fair share of costs. a) A system charge that reflects the value of being connected to the transmission system can minimize system bypass and related cost avoidance. This would recognize that a larger, higher cost transmission system was built to: i) accommodate and operate a market-based generation dispatch without any transmission constraints, and ii) that the current system costs are greater than what is required to serve load. b) A transmission tariff for end-use customers based on 12CP allocation results in an inefficient price signal by encouraging "needle" peak shifting that does not reduce bulk future transmission system build or costs. The proposed tariff reduces the costs allocated via the 12CP mechanism, thereby weakening this unintended price signal for a more efficient result. However, the UCA submits that a more efficient price signal could be achieved by eliminating the 12CP mechanism all together. c) By not entirely removing the 12CP allocation the proposed tariff minimizes disruption for existing customers who have responded to the current stronger price signal. However, it does not fully address the problem of uneconomic system bypass of the transmission system. d) The proposed tariff retains the existing and familiar overall rate structure for simplicity. e) The rate design attempts to address cross subsidization in the near term. The higher costs to existing transmission customers (from the proposed design) could

		encourage them to innovate and reduces the costs on site. However, as stated above, the UCA is concerned that the proposed rate design will continue result in more fixed costs being shifted to other customers over the long term with an increase in the energy charge component. The AESO should consider re-allocating a portion of the proposed energy charges under the current preferred design to NCP for transmission cost recovery given the current allocation may incent further behind-the-fence generation and cost avoidance. There could also be consideration of moving from net metering to gross metering practices for those with exemptions under Section 4 of the Hydro Electric Act in order to avoid further uneconomic bypass of the transmission system. The UCA recognizes that there would likely be significant impacts for customers with net metering in place and, as such, there would need to be continued stakeholder engagement to ensure the overall metering and tariff design is fair and reasonable for all customers in the near term and long term.
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	See UCA's responses to questions 3 and 4 above.
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	See UCA's responses to questions 3 and 4 above.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	See UCA's response to question 2 above.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	The UCA generally supports the modifications to DOS and eligibility requirements to better accommodate energy storage developments. With respect to DOS eligibility, the UCA believes that the AESO should consider energy storage owned by distribution or transmission companies for the purpose of providing ancillary services, and the treatment thereof, to ensure all options are evaluated, and the lowest cost overall solution is selected.

9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	A more dynamic indication of available unused transmission capacity in real time would allow more flexible and efficient joint use of the transmission and energy storage systems.
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	The targeted engagement process appears to be a reasonable approach. The targeted engagement should be a transparent process to ensure it is fair and reasonable to all customers. The UCA believes that there are cost saving measures that the AESO should consider implementing that can benefit all consumers, specifically with regards to the reduction of contract capacities should they exceed the actual highest metered demand significantly. The AESO should be pro-active in identifying these opportunities and bringing them to the customer's attention for consideration.
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	No initial comment.

12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	No comment
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	Yes. Mitigation will be necessary to limit disruption.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	A contract reset period with the implementation of the new rates would assist in minimizing disruption and better align contract capacity with actual usage.
15	Do you have any additional implementation considerations the AESO should consider?	Not at this time.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	Not at this time
17	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Shannon Fehr
Comments From:	West Fraser Mills Ltd.			**Phone:**	780-849-7719
Date:	2021/04/15			**Email**:	Shannon.fehr@westfraser.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was helpful to know the details of the AESO preferred DTS rate design. As most of earlier sessions on this topic, the session lacked the detailed analysis in support of their preferred rate design. It was a complete surprise to see what AESO now proposing as their “preferred design” compared to their direction a few months ago. The preferred design is supported with no credible analysis presented. It is frustrating to stakeholders that the input on rate design that is provided was neither integrated nor addressed in this session.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, the session was useful. Thank you for providing the “Bill –Impact Assessment Tool”. It would have been useful to provide forecasted future cost to see the real impact going forward. Issuance of the underlying assumptions and the data used for the analysis completed would have been useful prior to the session so stakeholders could ask focused questions on the design of the experts presenting.
3.	Are you supportive of the AESO’s preferred rate design? Why or why not?	No. West Fraser does not support the AESO’s preferred rate design. West Fraser is a member of ADC and supported the rate design submitted by ADC. AESO has not provided evidence that supports the need to change the current rate design. The proposed rate design is not supported by a cost causation study that has been shared with stakeholders. The rate design does not value the efficient use of the grid by high load factor customers, nor does it value the value of demand response that is provided by flexible loads.

	Questions	Stakeholder Comments

4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	West Fraser does not believe that AESO's preferred rate design meets their rate design objectives; a) Reflect Cost Responsibility The current rate design is based on cost causation while AESO's preferred rate design is moving away from this core objective. Lower the cost of transmission to those who use power during system peak with low load factor is opposite to the principal of cost causation. b) Efficient Price Signals Again the current rate design has a price signal to avoid/minimize future transmission build. The AESO's preferred rate design is diluting that signal by a) lowering the co-incident peak charge and b) by increasing the charge of energy irrespective of time of day usage. Many facilities like ours have spent millions of dollar to improve plant flexibility to practice of time of day usage to manage both energy and transmission cost. Time of day use has been encouraged all over the world to minimize the need for both generation and transmission. c) Minimal Disruption Having the transmission cost increase over 50% for large industrial consumers is not a minimal disruption. By mitigating these increases to a 10% for a limited period does not achieve the objective of minimal disruption. For a high energy intensive industry like ours, 10% increase is a material. A 50% increase after the end of mitigation period will be devastating. d) Simplicity The AESO's preferred rate design is no simpler than the current design since it is retaining all the charges. In fact, it is introducing more complexity by using 5 year rolling average of co-incident peak charges. e) Innovation and Flexibility The preferred rate design is moving away from innovation and flexibility. A simple example is the fixed charges on energy irrespective of the time of use. The flexibility will be achieved by having higher charges during peak hours for consumers to reduce their energy usage.

5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	There are many considerations that could have made, including: a) Reviewing the efficiency of maintaining the 12 CP method. Other CP methods, including the 5 CP method and the ADC rate design submittal could result in more efficient economic outcomes. b) Simplifying the CP charge method proposed (ie: remove the 5-year average) c) Use cost-causation principles to value energy-based charges d) Creating a rate class for industrials that have high load factors or provide demand response
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	The tariff should be based on cost-causation principles. There should not be regional cost signals like regional CP used to allocate cost.
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	The assumptions and methodology used by AESO for dividing bulk system charges in to demand and energy based on load and generation profile of various planning regions (40+ regions with arbitrary boundaries) is not based on sound reasoning. There will likely be perverse outcomes of providing a price signal that affects load but can only be affected by generation.
8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	No Comment.
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	No Comment.

10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	The need for mitigation discussions raises many questions, such as: • If mitigation for the most impacted customers, then how will the tariff design allow for cost shifting to customers that benefit, if the costs are avoided? • If the most affected customers are price sensitive, how would an increase in transmission cost greater than $0/MW be acceptable for any period of time? • Where does this money come from if increased cost is avoided through mitigation?
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	The AESO should not assume that customers that require mitigation will be able to accept any cost increase.
12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	Mitigation on a temporary basis is not feasible.

13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	The preferred mitigation should be the part of rate design such as interruptible rate.
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	West Fraser supports flexibility.
15	Do you have any additional implementation considerations the AESO should consider?	Participants should be eligible for cost recovery.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	The data that has been requested in the consultation sessions has not been provided. Please provide the information that has been requested.
17	Additional comments	AESO should not proceed with its preferred rate design for a number of reasons; • During this pandemic the main focus should be on managing our businesses. It is not the time to take resources/time from our main business of making goods and keeping Albertan employed. • AESO has not done/shared any study/analysis to justify the need of changing current tariff design. • AESO assumptions/analysis for their proposed design does not meet the level of study needed for such a major change. • AESO have not done any study of the impact of design change on the Alberta economy/job and its competiveness.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – March 25, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5

Period of Comment:	March 25, 2021	through	April 15, 2021	**Contact:**	Peter Burgess
Comments From:	Wolf Midstream			**Phone:**	403 472-0311
Date:	April 13, 2021			**Email**:	pburgess@wolfmidstream.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **April 15, 2021**.

The AESO is seeking comments from Stakeholders on Session 5. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5 hosted on March 25, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable to gain an understanding of the rationale the AESO has developed for the proposed tariff design.
2.	Please comment on Technical Information Session II hosted on March 31, 2021 (if you attended). Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable. The Q&A was particularly helpful.
3.	Are you supportive of the AESO's preferred rate design? Why or why not?	Not supportive of adopting the preferred rate design at this time. The overall outcome of the analysis, whereby high load factor/large load sites will be paying more than under the current tariff, appears to be the opposite direction the province needs to adopt to retain and attract customers to the transmission system. We would prefer to review the AESO's responses to the AUC information requests (letter dated April 7, 2021) prior to making further comments on the specific details of the preferred rate design.

	Questions	Stakeholder Comments
4.	Do you believe the AESO's preferred rate design meets the AESO's rate design objectives? Why or why not? a) Reflect Cost Responsibility (Cost recovery is based on cost causation, reflecting how transmission customers use the existing grid*) b) Efficient Price Signals (Price signal to alter behavior to avoid future transmission build) c) Minimal Disruption (Customers that have responded to the 12-CP price signal and invested to reduce transmission costs are minimally disrupted) d) Simplicity (Simplicity and clear price signals while achieving design objectives) e) Innovation and Flexibility (ISO tariff provides optionality for transmission customers to innovate while not pushing costs to other customers) *AUC Decision 22942-D02-2019 **Proposed rate design must fit within current legislation	
5.	Are there considerations that the AESO should include, exclude and/or modify in its preferred rate design to better achieve the AESO's rate design objectives? Please specify and include your rationale.	
6.	Please describe any areas in which you are aligned with the AESO's preferred rate design.	
7.	Are the assumptions the AESO used for the rate impact reasonable? Is there additional information that would help improve your understanding of rate impacts?	

8.	Are you supportive of the AESO's consideration of modernizing DOS, including its suitability for an energy storage charging capacity? Why or why not? And if so, provide your comments on the consideration of the AESO's DOS eligibility requirements, including for energy storage.	
9.	Please describe what components of the current DOS implementation (i.e., rate, terms, and conditions) limit the use of excess transmission capacity (i.e., capacity that would not otherwise be used under Rate DTS). How might those components of DOS be improved?	
10	Do you have any comments on the AESO's targeted engagement approach for mitigation discussions?	
11	Are there further considerations that the AESO should include, exclude and/or modify in the mitigation option starting principles? Please specify and include your rationale. 1. Limit the rate impact for customers: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition 2. Adapt with design and rates: Ensure options are adaptable to changes to the proposed design and forecast rates 3. Consistent application: Mitigation options can be applied consistently across all impacted loads and not be individually defined 4. Administrative simplicity: Feasible to implement with current tools and systems 5. Mutually acceptable: Account for feedback from broad stakeholder group	

12	Based on the AESO's mitigation options assessment, are there further considerations that the AESO needs to include, exclude and/or modify (e.g., temporary versus permanent)? Please specify and include your rationale.	
13	Are you in favour of some type of mitigation? Why or why not? If you are in favour of some type of mitigation, how would you assess whether a proposed mitigation approach is acceptable?	
14	In your view, should the AESO provide participants with more flexibility to adjust contract capacity, specifically by way of a contract reset period with the implementation of new rates and/or a PILON waiver if the contract level has not changed in the previous five years?	Most participants will be supportive of the proposal to reset contract volumes by way of a PILON waiver.
15	Do you have any additional implementation considerations the AESO should consider?	Regarding the contract reset period in 14 above: In the case of a contract reduction, the payment of the unrecovered capital investment would still apply. To encourage the contract reset, a method to transition these payments over a three-to-five-year period would be helpful to mitigate the impact of these payment obligations. Many DTS contracts are staged. The tariff would need to clarify how these types of contracts qualify for the reset with a PILON waiver. Contract volumes that have been in place for over five years within a staged contract should be treated on the same basis as non-staged contracts.
16	Do you have additional clarifying questions that need to be answered to support your understanding?	
17	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Agenda

Bulk and Regional Tariff Design Technical Information Session II

Session purpose and objectives

The purpose of this technical information session is to help ratepayers understand the impacts of the preferred rate design presented by the AESO on March 25, 2021 on their invoices.

The session objectives include:

- Review how to use the Bill Impact Tool in order to:
  - Enable stakeholders to evaluate the impacts of the rate design and mitigation on their sites; and
  - Enable stakeholders to assess the materiality of changes to their invoices
- Respond to stakeholder questions

Date: **March 31, 2021**
Time: 9:00 a.m. – 12:00 p.m.
Location: Webinar
Facilitator: Stack'd

Time	Agenda Item	Presenter
9:00 – 9:10	Welcome, introduction, purpose and session objectives	AESO
9:10 – 9:45	Walk through how to use the Bill Impact Tool, illustrating • How to evaluate the impacts of the rate design and mitigation on their sites; • How to assess the materiality of changes to their invoices; and • How to analyze the impact of future changes to site load	AESO
9:45 – 10:45	Q&A	All
10:45 – 11:00	Break	
11:00 – 11:50	Q&A	All
11:50 – 12:00	Session close-out and next steps	AESO

Public

Alberta Electric System Operator
Calgary Place, 2500, 330-5th Avenue SW Calgary, AB T2P 0L4

Bulk and Regional Tariff Design Technical Information Session II

March 31, 2021

Public

Notice

In accordance with its mandate to operate in the public interest, the AESO will be audio recording this session and making the session recording available to the general public at www.aeso.ca. The accessibility of these discussions is important to ensure the openness and transparency of this AESO process, and to facilitate the participation of stakeholders. Participation in this session is completely voluntary and subject to the terms of this notice.

The collection of personal information by the AESO for this session will be used for the purpose of capturing stakeholder input for the Bulk and Regional Tariff Design engagement sessions. This information is collected in accordance with Section 33(c) of the *Freedom of Information and Protection of Privacy Act*. If you have any questions or concerns regarding how your information will be handled, please contact the Director, Information and Governance Services at 2500, 330 – 5th Avenue S.W., Calgary, Alberta, T2P 0L4, by telephone at 403-539-2528, or by email at privacy@aeso.ca.

Disclaimer

The information contained in this presentation is for information purposes only. As such, the AESO makes no warranties or representations as to the accuracy, completeness or fitness for any particular purpose with respect to the information contained herein, whether express or implied. While the AESO has made every attempt to ensure the information contained herein is timely and accurate, the AESO is not responsible for any errors or omissions. Consequently, any reliance placed on the information contained herein is at the reader's sole risk.

Using Zoom – Asking questions

- Two ways to ask questions if you are accessing the webinar using your computer or smartphone
  - Click “Raise Hand” and the host will be notified that you would like to ask a question. The host will unmute your microphone, you in turn will need to unmute your microphone and then you can ask your question. Your name will appear on the screen, but your camera will remain turned off.
  - Click “Lower Hand” to lower it if needed.
  - You can also ask questions by tapping the “Q&A” button and typing them in. You’re able to up-vote questions that have been already asked.
- If you are accessing the webinar via conference call
  - If you would like to ask a question during the Q&A portion, on your phone’s dial pad, hit *9 and the host will see that you have raised your hand. The host will unmute your microphone, you in turn will need to unmute your microphone by hitting *6 and then you can ask your question. Your number will appear on the screen.

Stakeholder participation

The participation of everyone here is critical to the engagement process. To ensure everyone has the opportunity to participate, we ask you to:

- Listen to understand others' perspectives
- Disagree respectfully
- Balance airtime fairly
- Keep an open mind

Welcome and Introductions

Public

Session purpose and objectives

- Session purpose
  - The purpose of this technical information session is to help ratepayers understand the impacts of the preferred rate design presented by the AESO on March 25, 2021 on their invoices
- Session objectives
  - Review how to use the Bill Impact Tool in order to:
    - Enable stakeholders to evaluate the impacts of the rate design and mitigation on their sites;
    - Enable stakeholders to assess the materiality of changes to their invoices
  - Respond to stakeholder questions

Agenda

Time	Agenda Item	Presenter
9:00 – 9:10	Welcome, introduction, purpose and session objectives	AESO
9:10 – 9:45	Walk through how to use the Bill Impact Tool, illustrating • How to evaluate the impacts of the rate design and mitigation on their sites; • How to assess the materiality of changes to their invoices; and • How to analyze the impact of future changes to site load	AESO
9:45 – 10:45	Q&A	All
10:45 – 11:00	Break	
11:00 – 11:50	Q&A	All
11:50 – 12:00	Session close-out and next steps	AESO

Overview of Engagement Process

Public

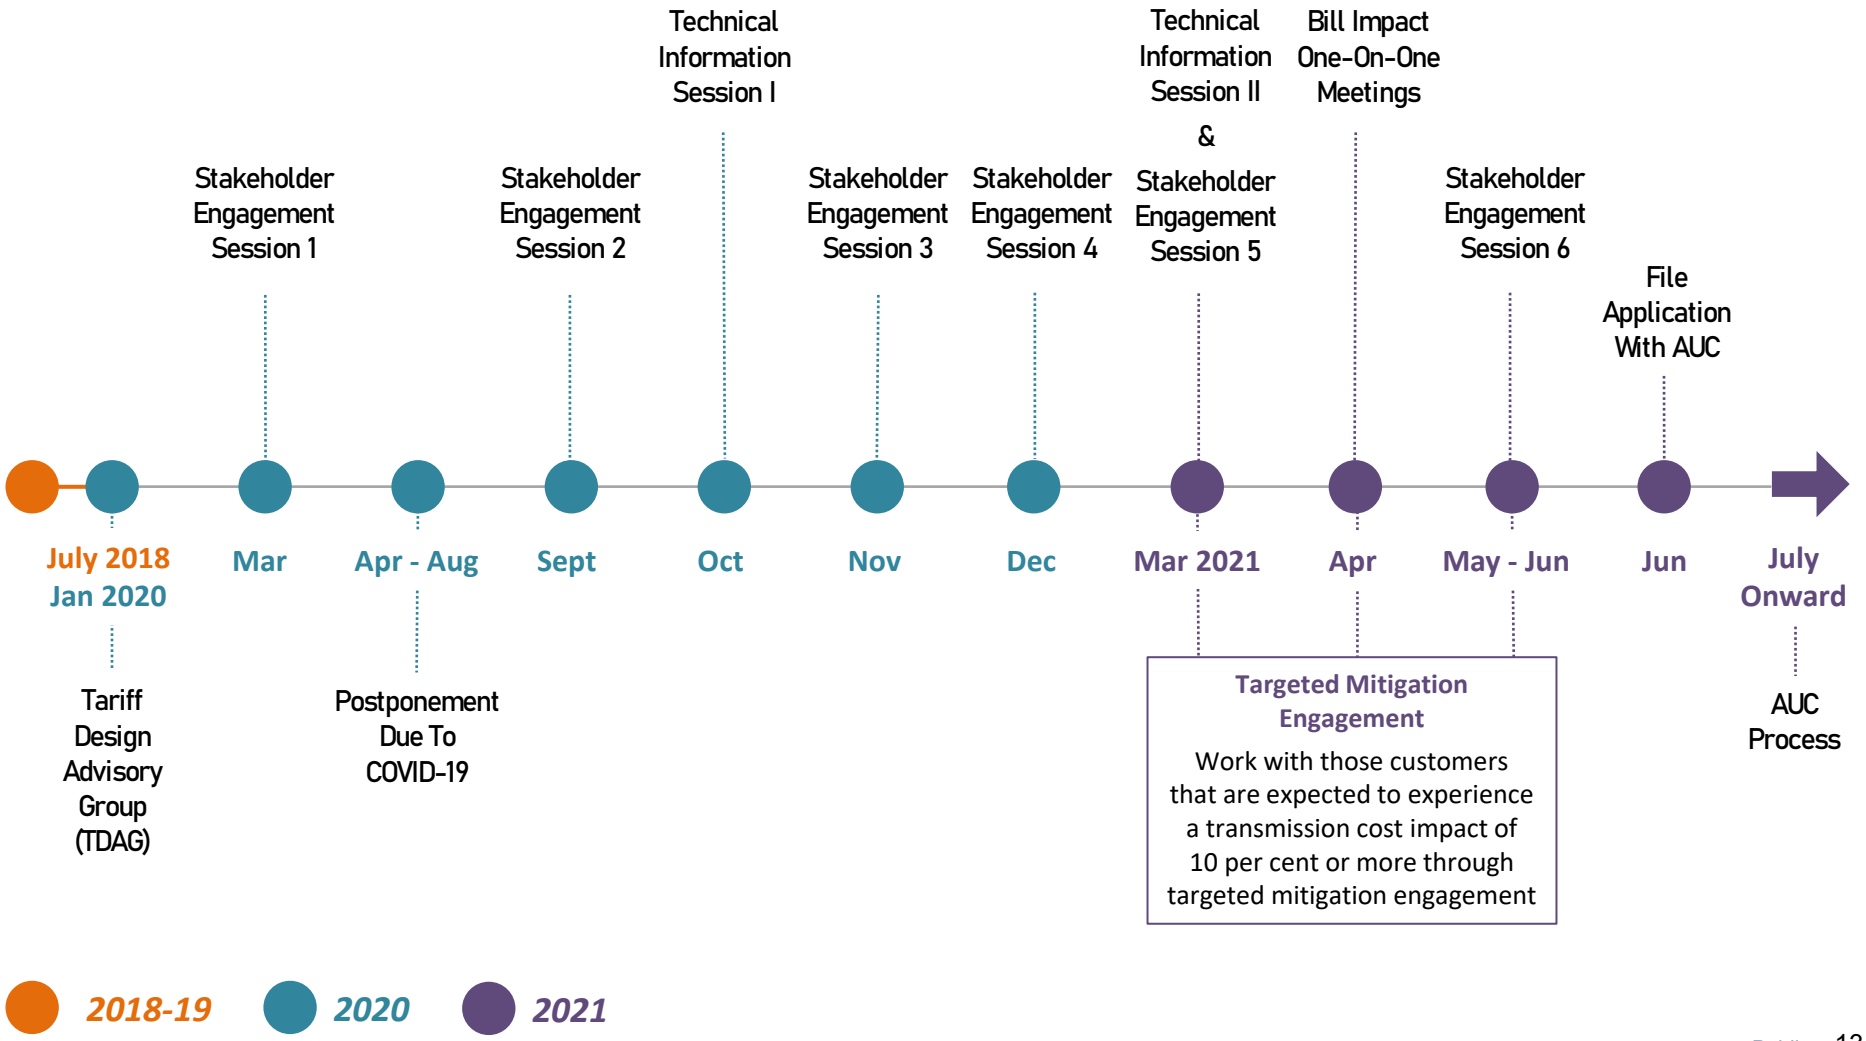
AESO Stakeholder Engagement Framework

Stakeholder engagement

The AESO's stakeholder engagement will:

- Ensure that stakeholders' needs and interests are consistently, transparently and meaningfully considered in the development of a rate design proposal for bulk and regional cost recovery;
- Provide clear objectives to be examined and evaluated in the development of a rate design proposal for bulk and regional cost recovery;
- Assist stakeholders in understanding and evaluating the AESO's preferred rate design;
- Supply stakeholders with tools that will allow them to consider and assess the impact of the AESO's preferred rate design; and
- Identify areas of alignment in order to support an efficient regulatory process.

Stakeholder engagement timeline



Bill Impact Assumptions

Public

Bill impact methodology and assumptions

- Calculate the impact of changes in bills attributable to Rate DTS (Demand Transmission Service) changes
  - Proposed and current rates were applied to the same billing determinants (for the 2019 test year) at each **point-of-delivery** (POD) for the bulk and regional charges
    - Transmission bill for each POD includes POD costs, Operating Reserve (OR) charges and other tariff charges
    - Total bill for each POD includes transmission bill and energy commodity costs
  - Estimated per cent impact based on change in transmission costs and total bill by POD under current and proposed tariff
  - Assumed 12-CP consumption maintained at current levels (i.e., no retroactive averages)
- Bills for an individual Rate DTS point-of-delivery will be different from estimates depending on actual demand and usage at the point-of-delivery and actual effective rates

Test year rate calculations methodology

	2019 Test Year	Preferred Rate Design
Revenue requirement (allocated to load)	$2,269.6 million	
2019 actual billing determinants	93,507.6 MW - months CMD 157,948.9 MW - months billing capacity 59,687.8 GWh	
Coincident metered demand (CMD)	47%	29%
Billing capacity	7%	17%
Energy	22%	31%
POD	24%	24%

Implementation considerations (Session 5 - Slide 79)

- To support the transition, the AESO will provide a forecast of rates in advance of them coming into effect
- The AESO will reduce red tape through administrative changes to rate sheets
- Updates to underlying data and transparent information
  - The AESO will propose to update the data underlying the cost allocations every five years
    - Calculations underlying the demand and energy allocations
    - Calculations underlying the allocations of demand to bulk and regional categories
  - Timing of highest coincident metered demand to hourly from 15-minute interval
    - Provides participants with more transparent information
    - Simpler calculation aligns with public information
    - More appropriately reflects information used for transmission planning

Bill Impact Tool v0.3

Public

Bill Impact Tool v0.3

- The Bill Impact Tool has been posted to allow stakeholders to calculate the estimated bill impact for their sites
- You can find the Bill Impact Tool v0.3 on the AESO website at www.aeso.ca
  - Path: Stakeholder Engagement > Rules, standards and tariff consultations > Tariff (filter) > Bulk and Regional Tariff Design > **March 31, 2021 Technical Information Session II** and/or **March 25, 2021 Session 5**
- We have also posted a Bill Impact Tool v0.3 with Sample Data to allow you to follow along for today's session
- Feedback from today's session will be considered for potential improvements to the tool

Bill Impact Tool v0.3 cont.

- Our Bill Impact Tool uses an Excel spreadsheet to analyze and compare five years of historical load data to determine an annual transmission bill under the current ISO tariff and preferred rate design
- This Bill Impact Tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document in effect, the authoritative document governs.
  - It is intended to allow ratepayers to assess historical annual impact with respect to the AESO's preferred bulk and regional tariff rate design (Preferred Rate Design) presented at the AESO's Stakeholder Session 5 on March 25, 2021
  - It will allow a market participant to estimate the annual historical charges for system access service under the AESO's Preferred Rate Design, including Rate DTS, *Demand Transmission Service*, and Rate PSC, *Primary Service Credit*.

Site Data Input tab

- Billing determinants in annual format (sum of monthly billing determinants) along with:
  - Historical charges for energy settlement, operating reserve charges, transmission constraint rebalancing charge, voltage control charges, and other system support services charge to allow for site-specific $/MWh rate for those charges
  - Rate PSC (Primary Service Credit) is applied to sites who do not utilize transmission facility owner (TFO) facilities. This calculation is necessary when reviewing impact percentages.
- The AESO continues to provide the data directly from AESO's billing system for AESO transmission-connected customers
  - For DFO transmission-connected customers, approval from the DFO is required;
  - This tool will not work for assessing bill impact for DFO distribution-connected customers.

Annual Summary tab

- Provides 5-year summary information plus impact after any adjustments
  - Site information, including an evaluation of transmission costs impact:

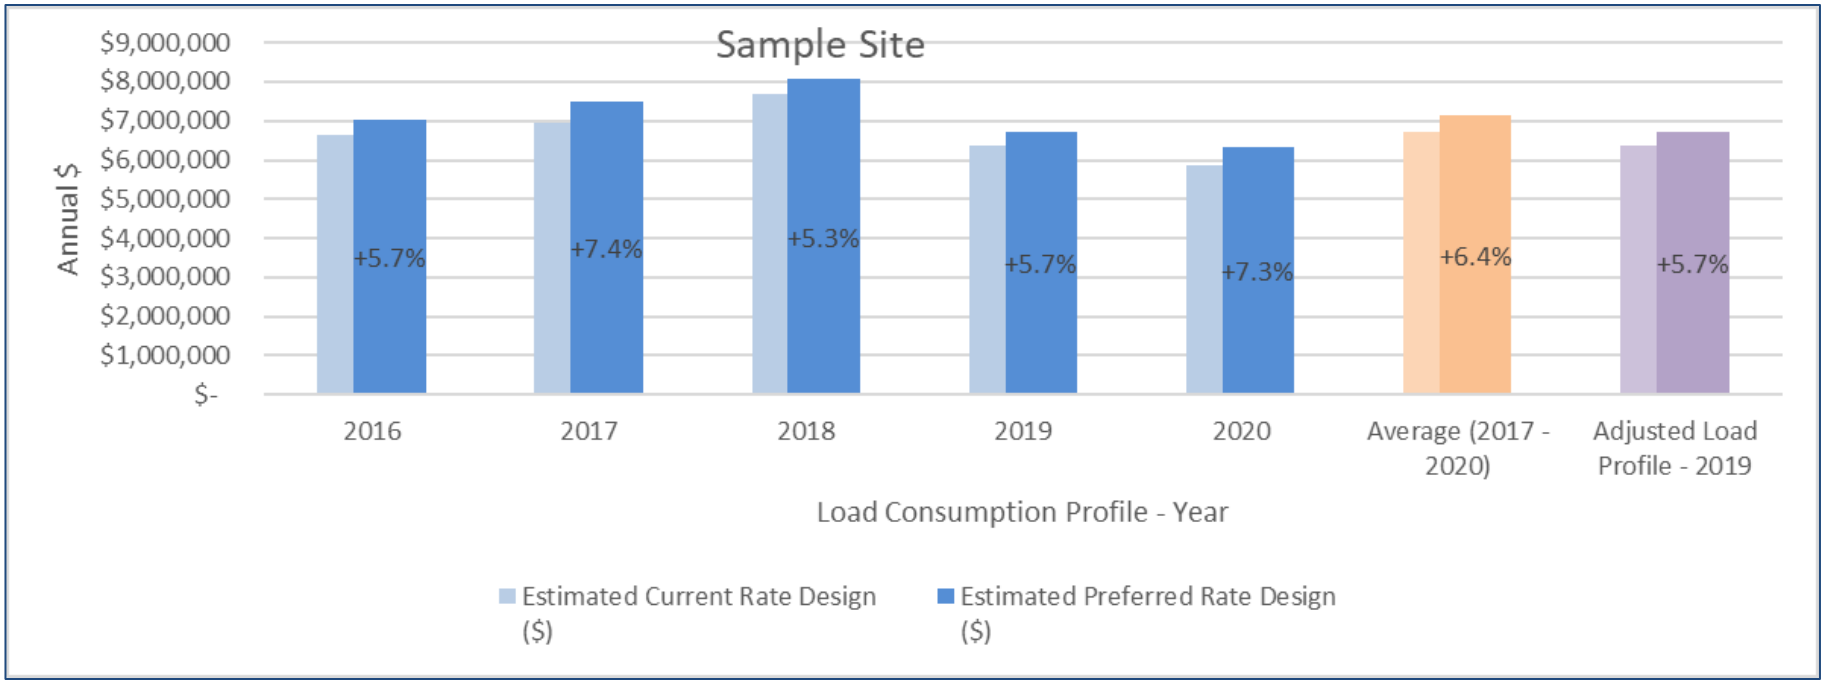
Market Participant:	**DFO**
Site Description:	**Sample Site**
Account ID:	**1000XXXXX**
Date:	March 28, 2021

Threshold for targeted mitigation engagement*:	
2019 Load Profile Year:	No
2017-2020 Average:	No

*Sites with greater than 10% impact (estimated transmission costs) will be invited to targeted mitigation engagement

Annual Summary tab cont.

- Transmission costs graph:



Annual Summary tab cont.

- Transmission costs year by year summary:

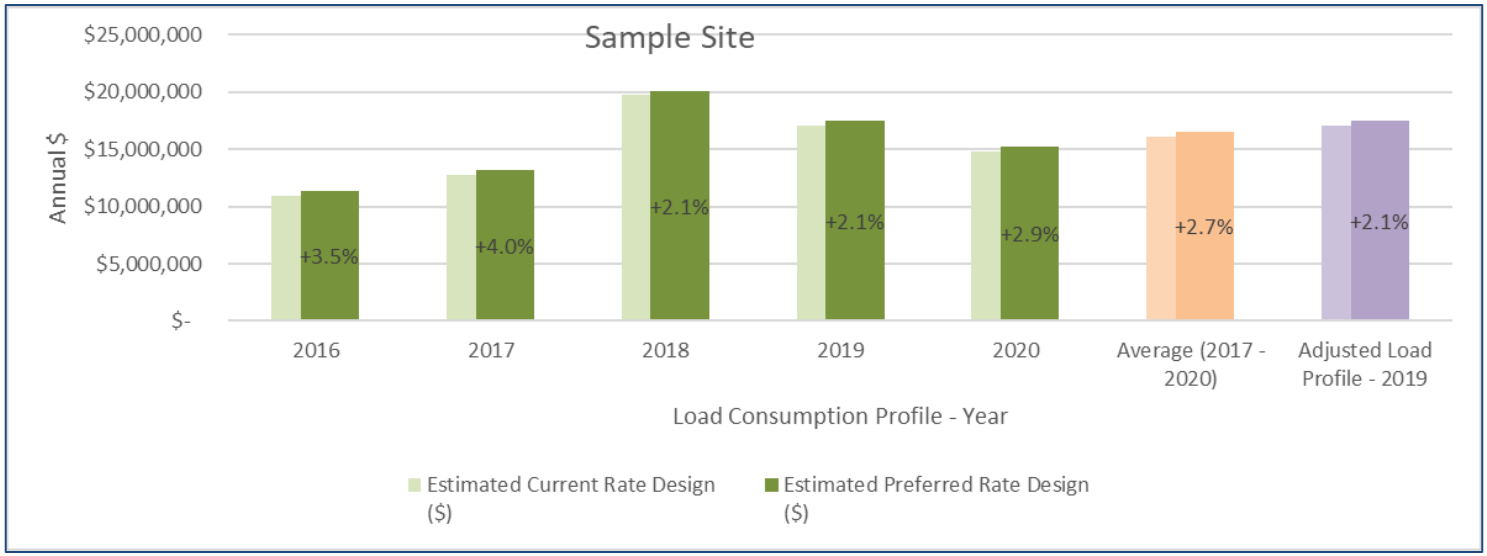
Estimated Transmission Costs									
Load Profile Year	Contract Capacity (MW)	Annual Billing Capacity (MW)	Annual Coincident Peak (MW)	Coincidence Factor (%)	Annual Energy (MWh)	Load Factor (%)	Estimated Current Rate Design ($)	Estimated Preferred Rate Design ($)	Estimated Impact ($)
2016	43.4	469	300	83.7%	237,025	90.4%	$ 6,635,891	$ 7,016,289	$ 380,398
2017	43.4	469	315	79.5%	261,944	90.4%	$ 6,965,785	$ 7,480,937	$ 515,152
2018	43.4	469	321	82.4%	251,907	88.4%	$ 7,674,997	$ 8,085,251	$ 410,254
2019	43.4	469	247	73.3%	207,360	84.3%	$ 6,353,887	$ 6,713,093	$ 359,206
2020	43.4	469	214	67.9%	199,593	86.4%	$ 5,883,626	$ 6,314,913	$ 431,287
Average (2017 - 2020)							$ 6,719,574	$ 7,148,548	$ 428,975

Annual Summary tab cont.

- Total bill graph and costs year by year:

Estimated Total Bill (Includes energy settlement costs)

Load Profile Year	Estimated Current Rate Design ($)	Estimated Preferred Rate Design ($)	Estimated Impact ($)
2016	$ 10,977,762	$ 11,358,160	$ 380,398
2017	$ 12,727,994	$ 13,243,146	$ 515,152
2018	$ 19,718,431	$ 20,128,684	$ 410,254
2019	$ 17,110,780	$ 17,469,986	$ 359,206
2020	$ 14,844,783	$ 15,276,070	$ 431,287
Average (2017 - 2020)	$ 16,100,497	$ 16,529,472	$ 428,975



Adjust Load Profile tab

- Select Load Consumption Profile Year: Load Consumption Profile Year: **2019**
- Use Override section to increase or decrease:
  - c) Monthly average highest metered demand;
  - d) Average coincident metered demand;
  - e) Contract capacity; or
  - f) Load factor or average metered energy

Billing Quantity		Factor	Monthly Average	Applicable Volumes		Overrides Factor	Overrides Monthly Average	Applicable Volumes	
(a)	Substation fraction (SF)			1.00000				1.00000	
(b)	Rate PSC Applicable			No				No	
(c)	Highest metered demand		28.1	337.1	MW			337.1	MW
(d)	Average coincident metered demand	73.3%	20.6	247.0	MW	73.3%		247.0	MW
(e)	Contract Capacity		43.4	43.4	MW			43.4	MW
(f)	Metered energy	84.3%	17,280	207,360	MWh			207,360	MWh
(g)	Billing capacity		39.1	468.7	MW			468.7	MW
(h)	% of pool price for operating reserve charge			6.45%				6.45%	
(i)	Apparent power factor difference			0.0	MVA			0.0	MVA
(k)	Site Average Pool Price on Energy Settlement			$51.88	/MWh			$51.88	/MWh
(l)	Annual Average Pool Price			$54.88	/MWh			$54.88	/MWh

- *Billing capacity volumes will adjust as overrides are entered*
- *Site % of pool price for operating reserve charges and site average pool price resulting from energy settlement are held constant*
- *Adjusted transmission costs and total bill amounts are carried over to 'Annual Summary' as the adjusted load profile*

Further information about bill impact

- Stakeholders can request from the AESO their site-specific data input for the tool. The AESO will provide the data to the Rate DTS market participant for the site (**working with the applicable distribution facility owner (DFO) if required**).
- Ratepayers can also request a one-on-one meeting with the AESO to ask questions about how the Bill Impact Tool works for their site. These bill impact one-on-one meetings will be scheduled during April 1-14, 2021.
  - Provides an opportunity to focus on a Ratepayer's particular site data
- **Email us at tariffdesign@aeso.ca** to request your site-specific data input for the Bill Impact Tool and/or to request your one-on-one bill impact meeting

Session Close-out and Next Steps

Public

Session feedback

- We want to thank you for attending the Bulk and Regional Tariff Design Technical Information Session II and we would appreciate your feedback on the session
- To limit stakeholder fatigue, we are collecting your initial feedback on the session by conducting a Zoom poll during the session rather than emailing you a short session survey following the session
- Zoom poll

Reminder: Stakeholder feedback

- We value stakeholder feedback, and we invite all interested stakeholders to provide their input on this session via the questions set out in the **Stakeholder Comment Matrix Tariff Session 5 on or before April 15, 2021**. The matrix is available on our website at www.aeso.ca.
  - Path: Stakeholder Engagement > Rules, standards and tariff consultations > Tariff (filter) > Bulk and Regional Tariff Design > March 25, 2021 Session 5
- Within this comment matrix we are looking for your feedback on the following:
  - Session 5 and Technical Information Session II
  - Preferred rate design
  - DOS rate eligibility
  - Targeted approach on mitigation discussions
  - AESO mitigation principles and options
  - Areas of alignment
  - Implementation considerations

Reminder: Next session

- The next session (Session 6) will be hosted in late May or early June 2021. Notice will be provided three weeks in advance in our Stakeholder Newsletter and on our website.
- Session 6 purpose
  - The purpose of the session is to engage stakeholders in a discussion of the AESO's mitigation discussion outcomes, energy storage assessment recommendation, Session 5 stakeholder feedback or follow-up, and areas of alignment
- Session 6 objectives
  - Provide an overview and seek stakeholder input on the outcomes of the targeted mitigation engagement
  - Present and discuss the energy storage assessment recommendation for the purpose of getting stakeholder feedback
  - Share our learnings and seek stakeholder input on Session 5 stakeholder feedback or follow-up and areas of alignment
  - Understand outstanding stakeholder concerns

Individual Site Bill Impact Tool

This bill impact tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document[1] in effect, the authoritative document governs.

1 Purpose

This bill impact tool is intended to allow ratepayers to assess historical annual impact with respect to the AESO's preferred bulk and regional tariff rate design ("Preferred Rate Design") described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 published on March 18, 2021 and presented in the corresponding AESO's Stakeholder Session 5 on March 25, 2021.

The purpose of this bill impact tool is to allow a market participant to estimate the annual historical charges for system access service under the AESO's Preferred Rate Design, including Rate DTS, *Demand Transmission Service* , and Rate PSC, *Primary Service Credit* .

The calculations in this bill impact tool provide estimated charges under the Preferred Rate Design only. The AESO calculates certain actual charges on an hourly basis rather than on average annual amounts, and ***actual charges under any future tariff design may differ from the estimated amounts presented in this bill impact tool*** .

2 Current Design and Preferred Rate Design Rate Calculations

Current Design (Test Year 2019) and Preferred Rate Design (Test Year Future) rates are calculated using actual 2019 billing detemrinants for all sites and 2019 revenue requirement. The rates only differ by changing the functionalizaiton and classification from current approved in the 2021 ISO tariff to the preferred rate design.

3 Completing the Individual Site Bill Impact Tool

This section describes how a market participant may complete the bill impact tool to estimate and compare annual charges (based on historical load information) for system access service under the existing 2021 ISO Tariff bulk and regional tariff design and under the AESO's Preferred Rate Design.

Initial Steps

Paste single site annual billing determinants on cell "A2" of the 'Site Data Input' tab.
This summary data can be provided by the AESO (in coordination with the DFO if necessary)

In the Technical Information Session on March 31, 2021, the AESO will provide examples and a detailed walk through of the bill impact tool.

The information included in the 'Site Data Input' tab will allow calculations on the 'Annual Summary' tab and will provide annual summary of bill impact resulting from the preferred rate design.

Adjusting Input Data

The 'Adjust Load Profile' tab provides the opportunity to override historical load profile or billing determinant information.

For assistance with this tool and Site Data Input data, please contact the AESO at: tariffdesign@aeso.ca

Attachments

Annual Summary - Summary of bill impact by year
Adjust Load Profile - Allow ratepayers to override input values to assess impact
Site Data Input - Tab to allow annual billing or load profile information by year

Revision History

Date	Description
2021-03-18	v 0.1 - Initial release with draft Test Year 2019 values
2021-03-22	v 0.2 - Fixed to work with all Excel versions and Contract Capacity to pull appropriate year selected (not just 2019)
2021-03-30	v 0.3 - Fixed to ensure adjusted load profile data aligned with results from 'Adjust Load Profile' data
2021-04-06	v 0.4 - Fixed to pull actual annual average pool price into 'Adjust Load Profile' tab

[1] "Authoritative document" is the general name given by the AESO to categories of documents made by the AESO under the authority of the *Electric Utilities Act* and associated regulations, and that contain binding legal requirements for either market participants or the AESO, or both. Authoritative documents include: the ISO rules, the reliability standards and the ISO tariff.

Individual Site Bill Impact Tool

This bill impact tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document[1] in effect, the authoritative document governs.

1 Purpose

This bill impact tool is intended to allow ratepayers to assess historical annual impact with respect to the AESO's preferred bulk and regional tariff rate design ("Preferred Rate Design") described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 published on March 18, 2021 and presented in the corresponding AESO's Stakeholder Session 5 on March 25, 2021.

The purpose of this bill impact tool is to allow a market participant to estimate the annual historical charges for system access service under the AESO's Preferred Rate Design, including Rate DTS, *Demand Transmission Service*, and Rate PSC, *Primary Service Credit*.

The calculations in this bill impact tool provide estimated charges under the Preferred Rate Design only. The AESO calculates certain actual charges on an hourly basis rather than on average annual amounts, and ***actual charges under any future tariff design may differ from the estimated amounts presented in this bill impact tool***.

2 Current Design and Preferred Rate Design Rate Calculations

Current Design (Test Year 2019) and Preferred Rate Design (Test Year Future) rates are calculated using actual 2019 billing detemrinants for all sites and 2019 revenue requirement. The rates only differ by changing the functionalizaiton and classification from current approved in the 2021 ISO tariff to the preferred rate design.

3 Completing the Individual Site Bill Impact Tool

This section describes how a market participant may complete the bill impact tool to estimate and compare annual charges (based on historical load information) for system access service under the existing 2021 ISO Tariff bulk and regional tariff design and under the AESO's Preferred Rate Design.

Initial Steps

Paste single site annual billing determinants on cell "A2" of the 'Site Data Input' tab.
This summary data can be provided by the AESO (in coordination with the DFO if necessary)

In the Technical Information Session on March 31, 2021, the AESO will provide examples and a detailed walk through of the bill impact tool.

The information included in the 'Site Data Input' tab will allow calculations on the 'Annual Summary' tab and will provide annual summary of bill impact resulting from the preferred rate design.

Adjusting Input Data

The 'Adjust Load Profile' tab provides the opportunity to override historical load profile or billing determinant information.

For assistance with this tool and Site Data Input data, please contact the AESO at: tariffdesign@aeso.ca

Annual Summary - Summary of bill impact by year
Adjust Load Profile - Allow ratepayers to override input values to assess impact
Site Data Input - Tab to allow annual billing or load profile information by year

Revision History

Date	Description
2021-03-18	v 0.1 - Initial release with draft Test Year 2019 values
2021-03-22	v 0.2 - Fixed to work with all Excel versions and Contract Capacity to pull appropriate year selected (not just 2019)
2021-03-30	v 0.3 - Fixed to ensure adjusted load profile data aligned with results from 'Adjust Load Profile' data
2021-04-06	v 0.4 - Fixed to pull actual annual average pool price into 'Adjust Load Profile' tab

[1] "Authoritative document" is the general name given by the AESO to categories of documents made by the AESO under the authority of the *Electric Utilities Act* and associated regulations, and that contain binding legal requirements for either market participants or the AESO, or both. Authoritative documents include: the ISO rules, the reliability standards and the ISO tariff.

Bulk and Regional Tariff Design Technical Information Session II hosted on March 31, 2021

I. Purpose and objectives of the session

The purpose of this technical information session is to help ratepayers understand the impacts of the preferred rate design presented by the AESO on March 25, 2021 on their invoices.

The session objectives include:

- Review how to use the Bill Impact Tool in order to:
  - Enable stakeholders to evaluate the impacts of the rate design and mitigation on their sites; and
  - Enable stakeholders to assess the materiality of changes to their invoices
- Respond to stakeholder questions

II. Session agenda

Time	Agenda Item	Presenter
9:00 – 9:10	Welcome, introduction, purpose, and session objectives	AESO / Stack'd
9:10 – 9:45	Walk through the Bill Impact Tool, illustrating • How to evaluate the impacts of the rate design and mitigation on their sites; • How to assess the materiality of changes to their invoices; and • How to analyze the impact of future changes to site load	AESO
9:45 – 10:45	Q&A	All
10:45 – 11:00	Break	
11:00 – 11:50	Q&A	All
11:50 – 12:00	Session close-out and next steps	AESO

IV. Session highlights

Captured below are highlights of the questions posed by stakeholders during the session. The AESO responded to stakeholder questions during the session. For a detailed review of the session please refer to the session webinar recording posted at www.aeso.ca.

- *Suncor:* I believe some percentages got mixed up on Slide 16 (Test year rate calculations methodology). Also, could we potentially get these percentages with one or more decimal place(s) in case you are updating the slide?
- *Dow Chemical:* Coincident metered demand (CMD), max highest metered demand (HMD), actual HMD are the max in the year?
- *AUC:* On Slide 16 for the 2019 actual billing determinants – is FTS (Fort Nelson Transmission Service) included in this?
- *CNRL:* On Slide 21 (Site Data Input tab) it mentions the tool will not work for assessing the bill impact for distribution facility owner (DFO) customers. Should customers reach out to the DFOs individually to get an idea of the impact? Or will a way to estimate this be coming in the future?
- *Voltus Energy:* The presentation last Thursday indicated that the five-year average coincident peak (CP) design will be "phased in". What does that mean? Example just shown included load profile from 2016-2020. Will CP from historical years from before the new design is implemented be included in that average for the first few years?
- *Alberta Newsprint:* It seems "Annual Average Pool Price" does not change with different years.
- *Solas Energy:* Where is the test data located? Can you provide sample data?
- *Power Advisory:* For the five-year rolling average, how would the early months in the year work? How will the DFOs treat this when they're dealing with distribution-connected generation (DCG) credits? Will the credits be arbitrarily reduced by one-fifth by looking at the average?
- *Alberta Newsprint:* You never pay more than 20 per cent of a year in a month – that's how the five-year average works. The problem is with the beginning years because there is no history of a five-year average. When you don't have a history, the average rate of year one is higher than the average for year five.
- *IPCAA:* The 12 CMD for 2019 is 157,948.9 MW is that based on 15 minutes? Based on hourly, the number would be lower so the 12 CP charge would be higher.
- *ADC:* Have you taken note of how many points of delivery are over-contracted and where there are opportunities to lower contract capacity for customers?
- *ADC:* Would the AESO look at mitigation for customers that were approaching 10 per cent, but based on the historical average did not meet the threshold?
- *ADC:* If you were using the 2021 forecasted billing determinants, how would the rate be different? It would adjust the rates of today's tariff, so you may see a bigger bill impact. We would like to see that so we can also see that impact on the bill. We not only want to do a look-back, but we also want to see a forecast.
- *Enbridge:* If the billing capacity is reduced with a Payment in Lieu of Notice (PILON), the change will not appear until year five, am I correct?

Public

- *CCA:* Could the AESO provide the five-year data by point-of-delivery (POD) for each of the DFOs to enable assessment of the impact in tariff structure by DFO? It would be helpful if the information on DFOs could be provided ahead of the filing and as part of the bill impact.
- *ASCENT Energy:* May I please ask - why are the Test Year 2019 Tariff rates different from the actual 2019 Tariff rates?
- *Power Advisory:* I echo ADC's request. The AESO has historically provided a 20-year forecast of rates. It would be very helpful to see a 20-year forecast under this new methodology. At the very least, I would hope to see this released based on the final rate design that the AESO files with the Commission. We understand that forecasts are subject to change, but it is still very helpful to see an expectation of how the rates will change over time.
- *ERCO:* Can the notice be rescinded within the five years?
- *Solas Energy:* For new applications (such as energy storage) with no history, does the five-year change occur? Or do they go directly to the first application?
- *ADC:* If a site built onsite generation in year two and no longer will be operating during peak demand, how does that change the five-year allocation for the PILON? Is it waived?
- *DePal Consulting:* Is your calculation on the "Adjust Load Profile" tab based upon reducing the MW hours? If this was a customer that was going to put in a generator, then they would probably get a bigger rate impact because they would limit their coincident peak charge as well – would they see a much greater decrease to their bill? Do you think this deals appropriately with uneconomic bypass?
- *IPCAA:* Most of the load goes through distribution companies and we've been trying to create calculators for these companies. Maybe there is some way the DFO and the AESO can work together to give a range so customers can sum up all of their sites and understand if their impact is positive or negative.
- *Enbridge:* Who can do the phase in for the rolling average and who can't do the phase in?
- *TC Energy:* For the current five-year 12-CP, you have a coincident peak at a certain hour in a certain month and your load contributes to that hour. The percentage that you contributed defines the percentage of the overall cost you have to pay. In the new system, what are we actually averaging? What I'd like to understand is how the new system actually changes from the current system – is it going from actuals to averages? Now that we're averaging, I'm not sure what I'm targeting – am I still targeting my contribution during the peak hours or am I targeting something else?
- *URICA:* We need an example – 95 per cent of these questions are because there's no example. To me, it's just using an average rather than using a single point in time.
- *Solas Energy:* Does the averaging mean that you could go extreme sometimes and very conservative sometimes and average out to be fine?
- *Enpowered:* If a customer decides to lower their coincident metered demand, they have had the historical data for one to two years. The charge they are going to be seeing is going to be less impactful because they will still have to respond to the first two years where they didn't respond – is that correct?
- *Customized Energy Solutions:* Is the 12-CP becoming a 60-CP and taking five years to get there? Is that an appropriate way to think of it? If that's the case, how would it look for a storage

Public

customer that is looking to zero out 12-CP in year five, but didn't have onsite generation for the first four years?

- *Enbridge:* For companies like Enbridge, we are focusing on ESG (environmental social governance) looking into solar panels, wind power, etc. onsite. If I'm putting a solar panel in and zeroing out the grid, because of the five-year average, the positive impact will be significantly reduced. This could prevent renewable energy development.
- *Solas Energy:* Can you provide examples of those where the future demand decreases, and one where the future demand increases? One more for a new generation. I think this would help.

Public

Agenda

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Session purpose and objectives

The purpose of this session is to engage stakeholders in a discussion of the AESO's demand opportunity service (DOS) modernization recommendation to allow expanded eligibility (e.g., energy storage). The session objectives include:

- Present additional background on the AESO's demand opportunity service – what it is, the service it provides and how it operates today
- Share our learnings on DOS modernization stakeholder feedback
- Present and discuss the AESO's DOS modernization recommendation for the purpose of seeking stakeholder feedback on the recommendation

Date: **Thursday, May 20, 2021**
Time: **8:00 a.m. – 1:00 p.m.**
Location: **Zoom Webinar**
Facilitator: **Stack'd**

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose and session objectives including extension request on engagement and filing schedule	AESO / Stack'd
8:15 – 9:00	DOS 101 – describes how the current DOS rate works today • Origins of DOS • How the current DOS rate is derived • How DOS works ○ How to apply for it, use it, curtail it, how is it charged and what happens if you misuse it • Q&A	AESO
9:00 – 9:20	Recap of AESO conclusions on non-firm rates • Q&A	AESO
9:20 – 9:35	Break	
9:35 – 9:45	Key highlights of AESO's DOS modernization recommendation • Opportunity rate design principles • Proposed key changes to DOS	AESO
9:45 – 10:05	What we heard • DOS rate under preferred rate design • Fast recall rate • Annual term for DOS • DOS take-or-pay requirement • Provision of ancillary services as a DOS customer • Availability of capacity	AESO

Public

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (Demand Opportunity Service)

May 20, 2021

Notice

In accordance with its mandate to operate in the public interest, the AESO will be audio recording this session and making the session recording available to the general public at www.aeso.ca. The accessibility of these discussions is important to ensure the openness and transparency of this AESO process, and to facilitate the participation of stakeholders. Participation in this session is completely voluntary and subject to the terms of this notice.

The collection of personal information by the AESO for this session will be used for the purpose of capturing stakeholder input for the Bulk and Regional Tariff Design engagement sessions. This information is collected in accordance with Section 33(c) of the *Freedom of Information and Protection of Privacy Act*. If you have any questions or concerns regarding how your information will be handled, please contact the Director, Information and Governance Services at 2500, 330 – 5th Avenue S.W., Calgary, Alberta, T2P 0L4, by telephone at 403-539-2528, or by email at privacy@aeso.ca.

Using Zoom – Asking questions

- Two ways to ask questions if you are accessing the webinar using your computer or smartphone
  - Click “Raise Hand” and the host will be notified that you would like to ask a question. The host will unmute your microphone, you in turn will need to unmute your microphone and then you can ask your question. Your name will appear on the screen, but your camera will remain turned off.
  - Click “Lower Hand” to lower it if needed.
  - You can also ask questions by tapping the “Q&A” button and typing them in. You’re able to up-vote questions that have been already asked.
- If you are accessing the webinar via conference call
  - If you would like to ask a question during the Q&A portion, on your phone’s dial pad, hit *9 and the host will see that you have raised your hand. The host will unmute your microphone, you in turn will need to unmute your microphone by hitting *6 and then you can ask your question. Your number will appear on the screen.

Stakeholder participation

The participation of everyone here is critical to the engagement process. To ensure everyone has the opportunity to participate, we ask you to:

- Listen to understand others' perspectives
- Disagree respectfully
- Balance airtime fairly
- Keep an open mind

Welcome and Introductions

Session purpose and objectives

- The purpose of this session is to engage stakeholders in a discussion of the AESO's demand opportunity service (DOS) modernization recommendation to allow expanded eligibility (including energy storage). The session objectives include:
  - Present additional background on the AESO's demand opportunity service – what it is, the service it provides and how it operates today
  - Share our learnings on DOS modernization stakeholder feedback
  - Present and discuss the AESO's DOS modernization recommendation for the purpose of seeking stakeholder feedback on the recommendation

Agenda

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose and session objectives including extension request on engagement and filing schedule	AESO / Stack'd
8:15 – 9:00	DOS 101 – describes how the current DOS rate works today • Origins of DOS • How the current DOS rate is derived • How DOS works ○ How to apply for it, use it, curtail it, how is it charged and what happens if you misuse it • Q&A	AESO

Overview of Engagement Process

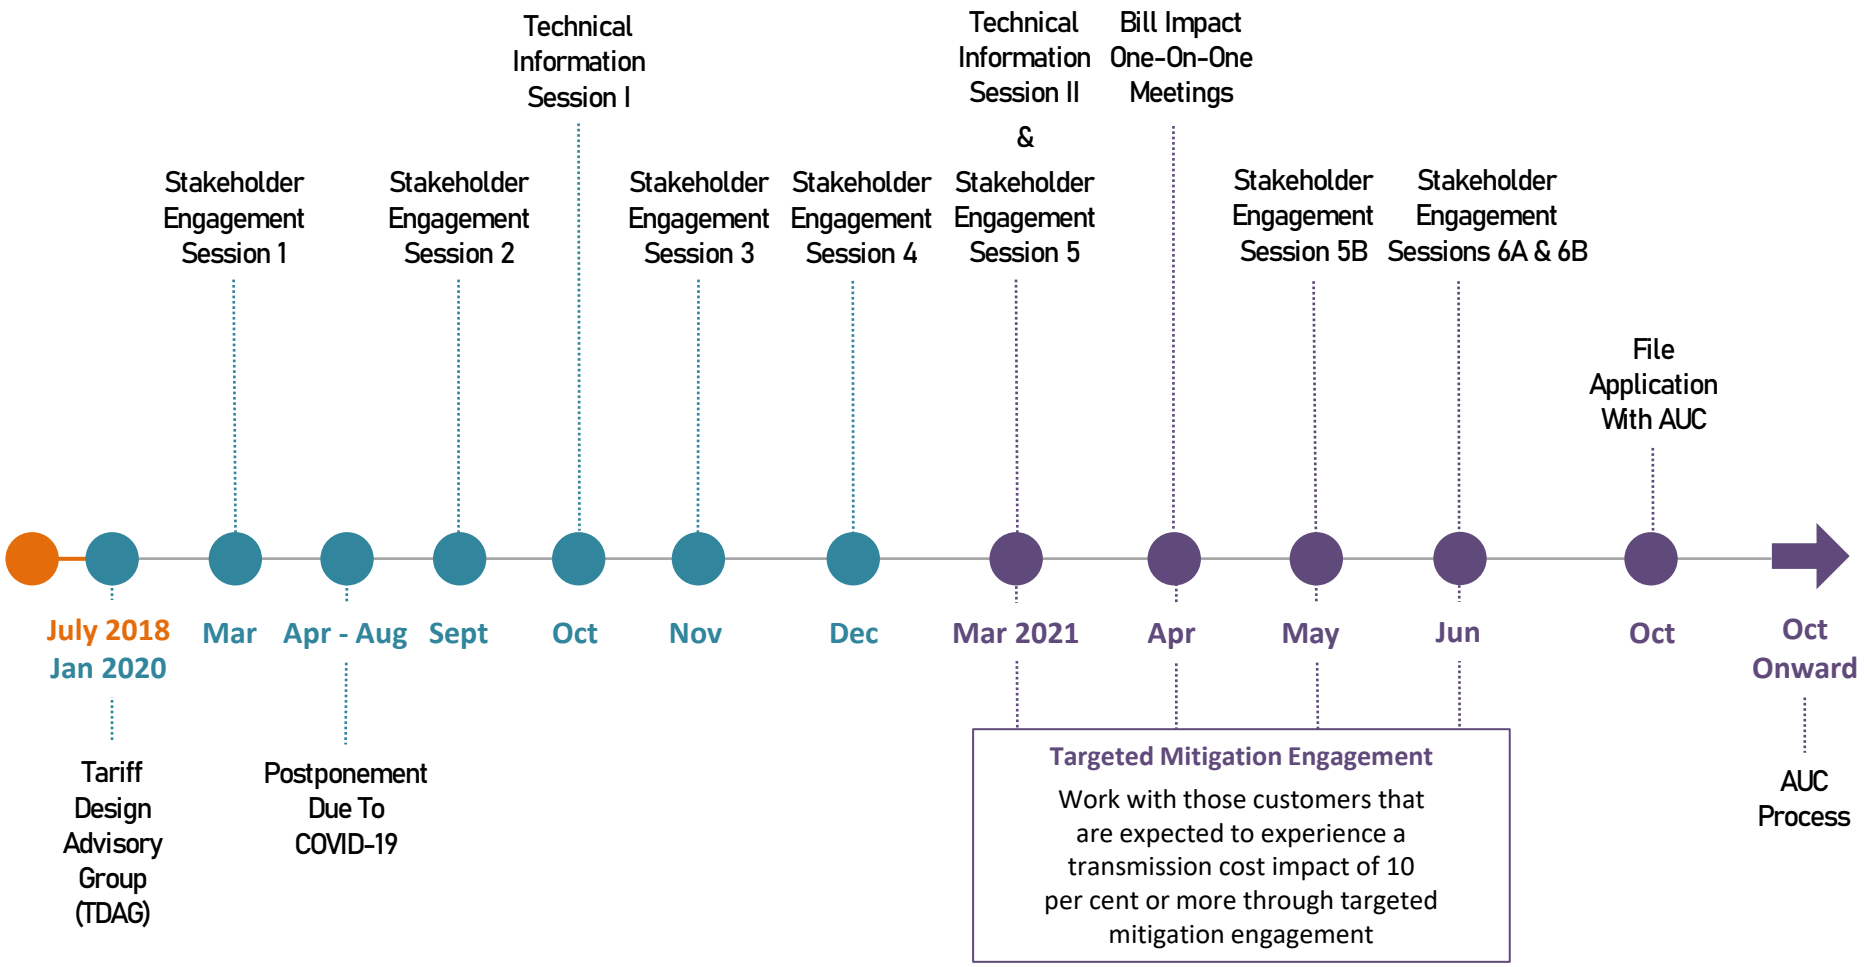
AESO Stakeholder Engagement Framework

Stakeholder engagement

The AESO's stakeholder engagement will:

- Ensure that stakeholders' needs and interests are consistently, transparently and meaningfully considered in the development of a rate design proposal for bulk and regional cost recovery;
- Provide clear objectives to be examined and evaluated in the development of a rate design proposal for bulk and regional cost recovery;
- Assist stakeholders in understanding and evaluating the AESO's preferred rate design;
- Supply stakeholders with tools that will allow them to consider and assess the impact of the AESO's preferred rate design; and
- Identify areas of alignment in order to support an efficient regulatory process.

Stakeholder engagement timeline



2018-19 2020 2021

DOS modernization

- The DOS rate has been a part of the tariff framework since de-regulation. However, the DOS rate has few users and would benefit from modernization
- This modernization effort looks to make improvements to the rate that:
  - Encourage greater opportunities for revenue maximization
  - Improve the operation and administration of this opportunity service

DOS 101 – Current DOS Rate Today

The origins of DOS (circa 2001)

- The original EAL* tariff application described opportunity service as
  - A short-term temporary service, provided on an as-available basis
  - Available to customers who could clearly demonstrate that their use of the transmission system would not be economically viable at the rates otherwise applicable
  - Used for short periods, in order to avoid the impact of contract demand or ratchet charges that would otherwise result
- The EAL stated
  - The objective of the opportunity service was to reduce the level of average rates charged to other customers by applying the extra revenue earned from the use of temporarily under-utilized transmission system assets
  - Pricing of the opportunity service should be on a value of-service rather than a cost basis
  - Criteria should be applied to prevent cannibalization of other revenues.

* ESBI Alberta Limited – the Transmission Administrator prior to the formation of the AESO

The origins of DOS (circa 2001) cont.

- The Energy & Utilities Board agreed and went further to state
  - Consistent and reliable application of qualification criteria is essential to the success of opportunity rates
  - To improve the chances of the accrual of benefits to other customers, effective screening criteria and regular audits are required

* ESBI Alberta Limited – the Transmission Administrator prior to the formation of the AESO

DOS 101

1. How the current DOS rate is derived (DOS pricing)
2. How DOS works
    i. How to apply for it (DOS Application Process)
    ii. How to use it (DOS transaction request process)
    iii. How to curtail it (DOS recall)
    iv. How is it charged (DOS settlement)
    v. What happens if you misuse it (DOS audit)

DOS 101 – How the current DOS rate is derived (DOS Pricing)

Derivation of the DOS pricing

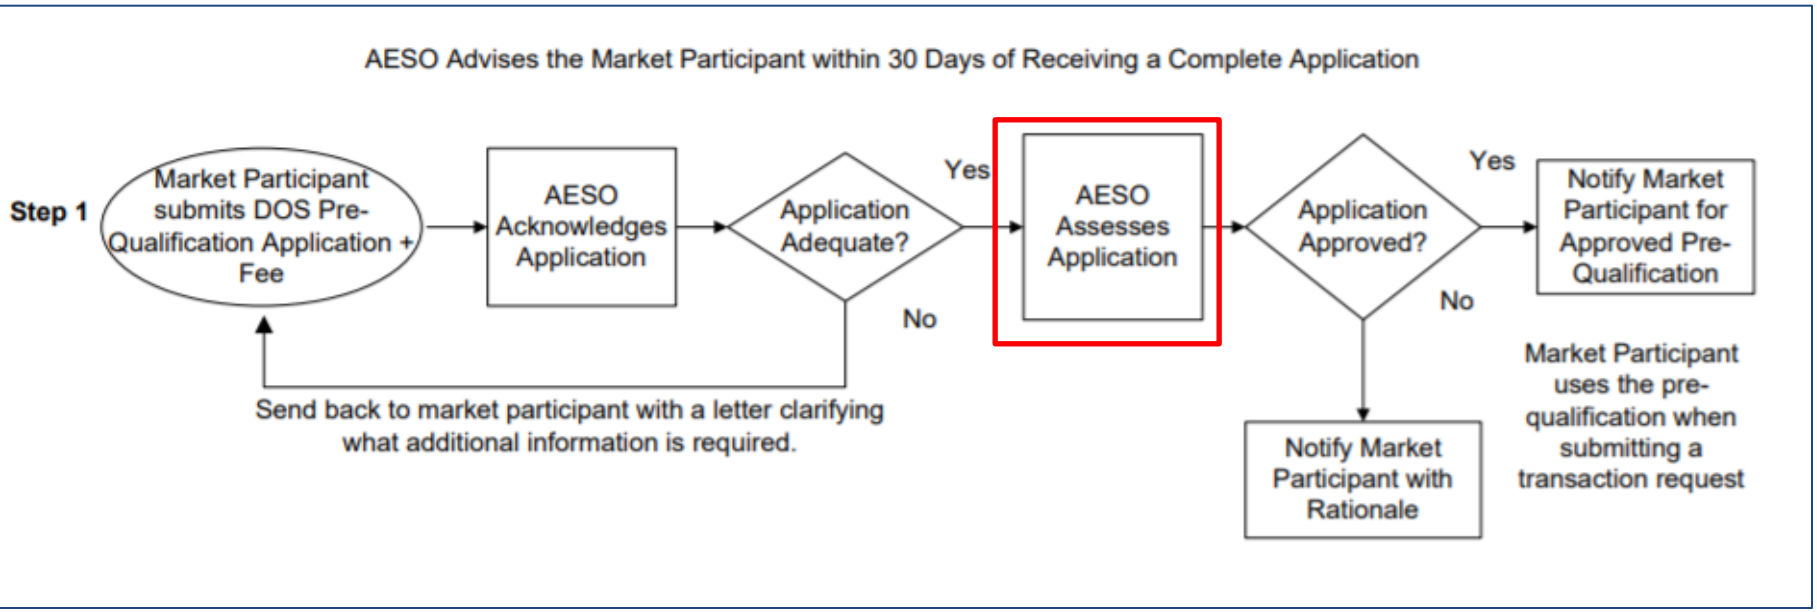
- Consistent with the original pricing principles the AESO's 2010 GTA stated
  - Rate DTS costs are first converted, by component, to $/MWh charges
  - The variable components of costs which are attributable to demand opportunity service — namely, the variable components of the bulk system and local system charges and the operating reserve charge are then allocated to the DOS rate
  - A contribution to transmission system fixed costs is added to each of the Rate DOS 1 Hour and Rate DOS Term services

DOS 101 – How to apply for it (DOS Application Process)

Annual DOS application

- Located in Appendix A of the ISO tariff
- Application requires:
  1. Start and end date
  2. Requested contract capacity
  3. Frequency of use
  4. MWh per month
  5. Technical information
     a) Load characteristic
     b) Anticipated load factor
     c) Power factor
  6. A case explaining that the use of this capacity is for a market opportunity and this energy consumption would not otherwise occur under Rate DTS

Current application process



Assess application from two perspectives

1) **Regulatory / Economic** – Does the application provide evidence that use of the service will not result in the reduction of other revenues?

2) **Reliability** – Can the system support this DOS load?
   - Assess power flows and voltage stability at peak load
   - If issues found may require further study

https://www.aeso.ca/assets/Uploads/DOS-Business-Practice-Document.pdf

Current eligibility requirements

A market participant must satisfy the AESO through a clear, thorough and convincing case, with supporting facts, that demonstrates that the proposed increase in demand:

1. Will be used on a temporary or repeated short term basis
   - The premise of this requirement is that if you are going to use the capacity on a long-term basis, then customers should contract for DTS
2. And, will
   - Replace an alternative source of energy where the market participant (i) has an available alternative source of energy, including means to employ it, that could be rationally used instead of electric energy from the AIES; and (ii) the cost of utilizing the alternative source of energy is less than the cost of receiving additional electric energy under Rate DTS; **or**
   - Take advantage of a market opportunity that requires additional electric energy where the cost of receiving additional electric energy under Rate DTS renders the opportunity uneconomic; and the market participant's alternative is to forego the opportunity

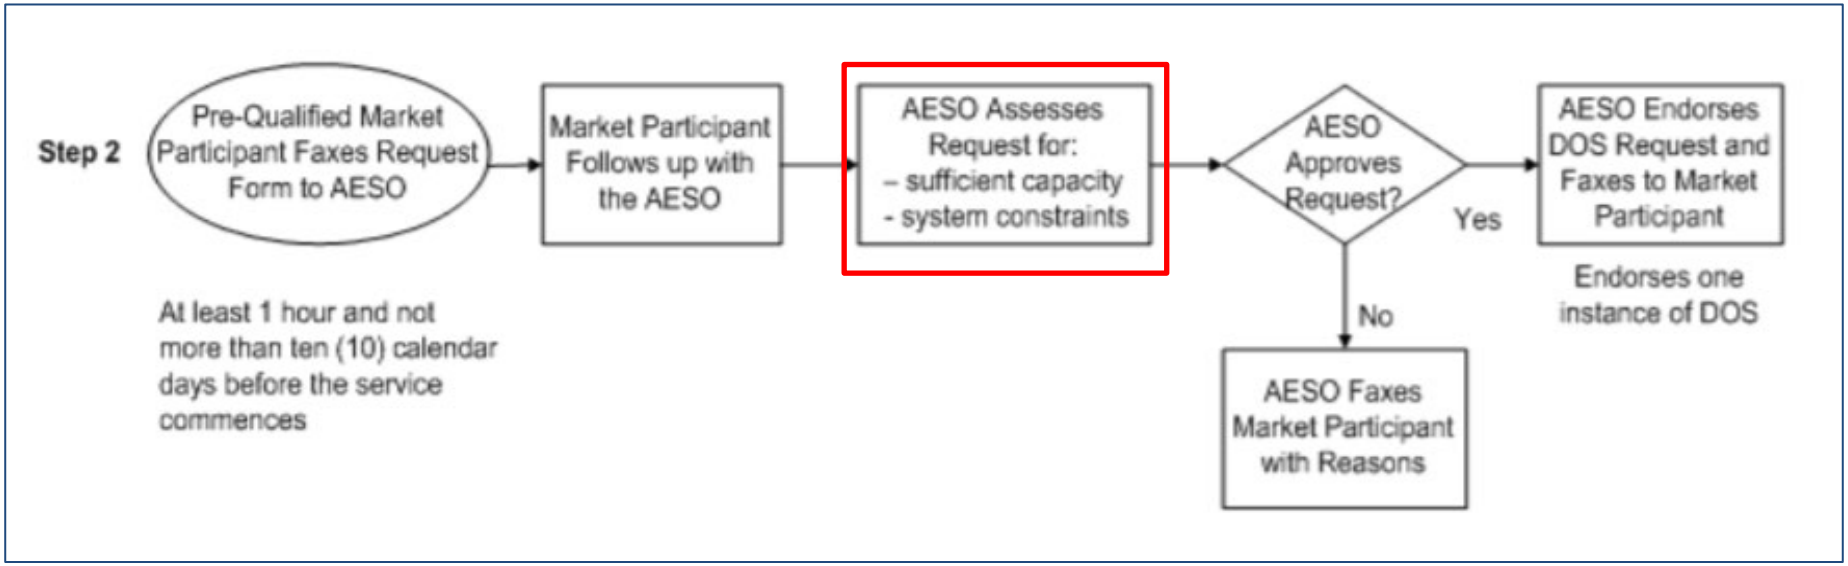
Ineligible reasons for using DOS

The use of DOS energy is not permitted if the request is to:

- Replace the energy provided by an on-site self-supplying generating unit on an unplanned outage or derate
- Be an alternative to the adoption of energy efficiency measures where the use of DOS could make the energy efficiency measures uneconomic

DOS 101 – How to use it (DOS Transaction Request Process)

Current DOS usage request process



Transaction request may be denied for two reasons:

1) **Erroneous request**
   - Incomplete form
   - No valid DOS contract
   - Volumes exceed contract capacity or MWh/month

2) **n-1 condition –** indicating insufficient capacity or constraints
   - Assessment performed upon receipt of the transaction request

DOS 101 – How to curtail it (DOS Recall)

DOS types and recall requirements

- The DOS rate type specifies the response requirement for recall

DOS type	Current rate	Recall requirement rationale
7 minute	$5.48/MWh	Seven minutes was chosen as a reasonable amount of time needed to remove the opportunity load off the electric system as quickly as possible but still allow time for the market participant to react to the instruction
1 hour	$18.14/MWh	Original consultations suggested there are customers that could be curtailed but needed more time to shut down processes
Term	$117.97/MWh	Seven minutes but would be recalled after 7 minutes and 1 hour DOS

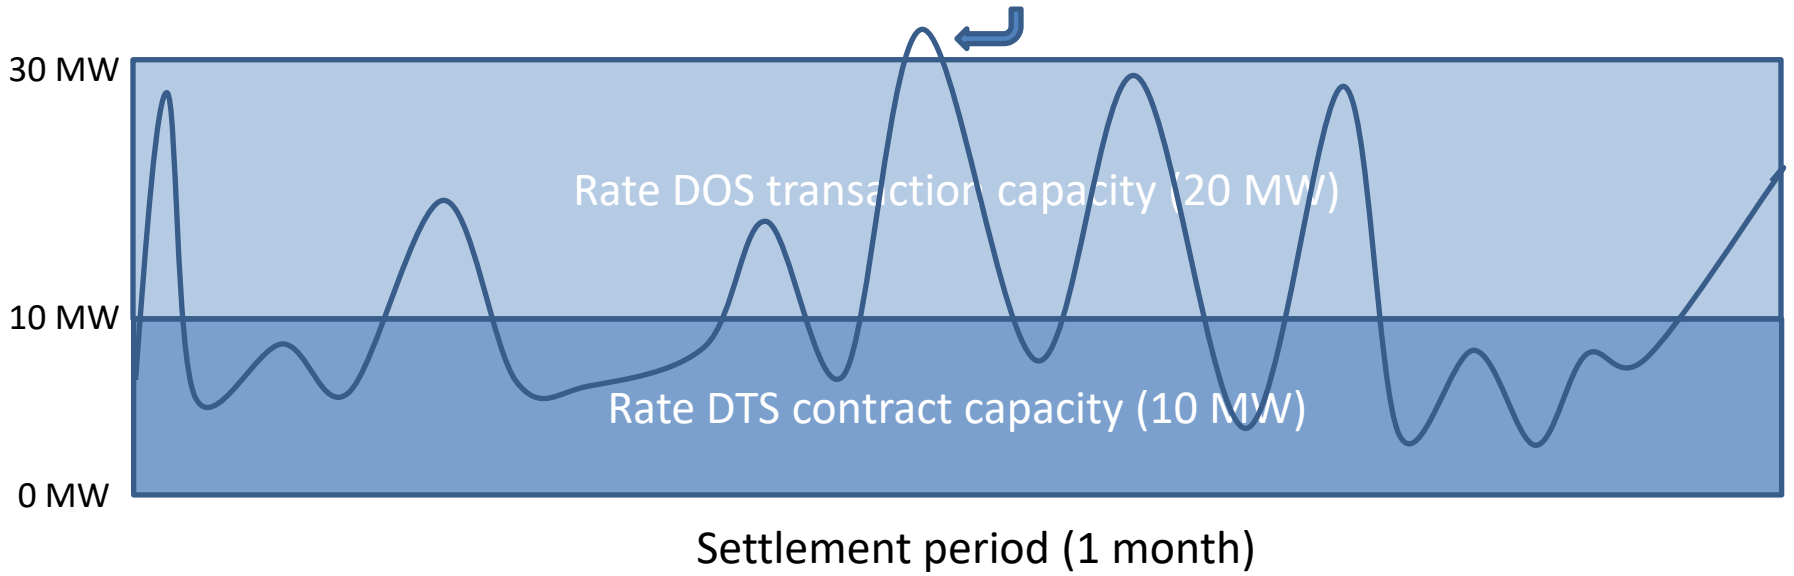
DOS energy recall

- DOS recalls occur for three primary reasons:
  1) Supply adequacy (Energy Emergency Alert (EEA) events)
  2) Real-time transmission constraint
  3) Voltage support
- Recall is issued to all DOS loads deemed effective in order of priority
- The system controller does not try to assess the duration of the contingency

DOS 101 – How is it charged (DOS Settlement)

Metered energy for DOS settlement

- DTS charges are applied to all metered energy at or below the DTS contract capacity
- DOS charges are applied to all metered energy above the DTS contract level and below the sum of the DTS and DOS contract capacities
- DTS charges are applied to any metered energy greater than the sum of the DTS and DOS contract capacities



Take-or-pay provision and losses

- The DOS settlement includes a take-or-pay provision for transaction requests
  - If a DOS customer submits a transaction request to use DOS energy in a month but does not actually use as much energy as indicated in the transaction request the customer may have to pay 75 per cent of the transaction request energy rather than pay for the actual energy consumed under DOS at the applicable DOS rate
  - The intent of this provision is to have the market participant submit realistic transaction requests
- DOS settlement includes the allocation of losses to the DOS energy consumed in the month
  - Each DOS load is assessed a loss factor

DOS 101 – What happens if you misuse it (DOS Audit)

Effect of disqualification

- The AESO may audit any market participant's circumstances to verify that the use of DOS complies with the ISO tariff and request additional information to:
  - Determine whether the use of DOS has ever failed to comply with the eligibility criteria
  - Identify any circumstances that would justify leniency or severity in applying any retroactive charges
- If the AESO finds that the market participant is no longer eligible for DOS, all metered energy delivered to the market participant will be billed under Rate DTS as of the effective date of the disqualification and the AESO will terminate billing under Rate DOS
- The AESO may recover retroactive amounts for the period during which such market participant did not qualify for, but was billed under, Rate DOS

Questions

Recap of AESO Conclusions on Non-Firm Rates

Forecasting and planning for load on Alberta's system

- Forecast load location and level, and generation location and dispatch are main inputs that are used to create scenarios for transmission system planning studies
  - Info provided in P1 – System Planning Report Transmission Tariff Work Group
- The AESO uses the following approach when planning for load on the system, be it low load factor, high load factor, standby with self-supply or price responsive/flexible:
  - Load forecasting methodology is a blend of top-down economic-based Alberta internal load (AIL) forecasts combined with bottom-up point-of-delivery (POD) level load shapes
  - Hourly gross load forecasts at each POD are the basis for load information used in planning the transmission system
  - Deterministic study conditions, developed based on expected stress conditions from anticipated combinations of load and generation output are analyzed
  - Characteristics of POD level load are captured in hourly forecast; individual POD level consumption in the study is dependent on its correlation with the study conditions (e.g., expected POD consumption during regional peak)

Related to AUC Questions 4.1 (g) & 6

Forecasting and planning for load on Alberta's system (cont.)

- Other considerations
  - AESO is leveraging existing forecast processes to account for energy storage, in alignment with its expected operation
  - DOS load is removed from POD level load data in study case if causing system issue
  - For local studies, the net flow of sites with self-supply may also be tested at the DTS contract level and a high outflow condition

Related to AUC Questions 4.1 (g) & 6

Session 4 feedback on energy storage tariff treatment

- What we heard
  - Current rates reflect one class of service: firm load
  - Consideration should be given to rates that reflect the different types of uses of the system: non-firm rates
  - Types of tariff treatment that could reflect different use of the system:
    - Rates that allow additional use of available capability that would not otherwise occur
    - Rates that reflect transmission cost savings from interruptions to relieve constraints
    - Rates that encourage participation in markets or provision of ancillary services

Summary of non-firm rate assessment

	Rates that reflect transmission cost savings from interruptions to relieve constraints	Rates that encourage participation in markets or provision of ancillary services	Rates that allow additional use of available capability that would not otherwise occur
Description	• Demand reduction (or increase) beneficial to reduce transmission constraints, value of which is reflected in rates	• Reduced DTS rate available everywhere to eligible loads / energy storage that participate in markets or reliability services (energy, OR)	• Discount relative to DTS for curtailable service to enable use of the system that would not otherwise occur to offset costs for other customers
Rationale	• Identify need in specific location • Interrupt load to manage transmission constraints • Lower future transmission costs	• Available everywhere • Encourage participation in market / service through additional bids and offers	• Encourage efficient use of capability without incurring additional transmission costs (AESO can recall and load must curtail)
Conclusions	• Rates that reflect transmission cost savings from interruptions to relieve constraints have a strong locational component	• Rates that encourage participation in markets or provision of ancillary services do not impose different transmission costs than those that do not, and provision of services is compensated through those markets / contracts	• Rates that allow additional use of available capability that would not otherwise occur are beneficial for all stakeholders provided the use of this capability would truly not otherwise occur under Rate DTS

Rates that allow additional use of available capability

- The AESO has considered options to reflect different use cases of the grid and has identified that energy storage could make use of transmission capability that would not otherwise occur for benefit of other customers or drive the need for additional transmission capacity
- DOS is one such rate
  - Allows customers connected to the grid to draw additional power over and above the amount they are contracted for under DTS as a means of reducing DTS charges for all customers
- Current treatment of DOS load
  - The AESO does not plan to build or modify transmission facilities for DOS customers beyond their DTS contract levels

Questions

Break

Key Highlights of AESO's DOS Modernization Recommendation

Opportunity service rate design principles

- Maintain original intent of the DOS rate while enabling greater use for revenue maximization and improve the operation and administration of the rate
- Ensure opportunity service rates result in use of transmission capacity that would normally not otherwise be used under Rate DTS
- Ensure the design
  - Applies the appropriate level of discretion in approvals
  - Does not disqualify existing DOS loads
  - Facilitates the timely review of applications given the potential increase in number of applications
  - Aligns with current AESO operations, planning, connections, and settlement processes

Proposed key changes

Current Rate DOS

- Technical Assessment
- Annual term and re-application
- Temporary or repeated short-term basis
- Business case or self-supply outage
- Recallable

Proposed Rate DOS

- Technical Assessment
- Business case or self-supply outage
- Maximum load factor
- Bidding and dispatch

What We Heard

DOS rate under the Bulk and Regional preferred rate design

Stakeholders commented that the DOS rate is too high especially with the preferred changes to cost allocation

- The DOS rate is estimated to change from ~$5/MWh to ~$13/MWh under the preferred rate design
- AESO's view is the DOS rate is still sound and redesigning the mechanics of the DOS rate is not part of recommendation
- Rate DOS is supportive of cost causation principles
  - Rate DTS reflects use of the system, and
  - Rate DOS reflects only the energy component costs in Rate DTS and not the demand components as transmission is not planned to meet the forecasted DOS load

Fast recall rate

Some stakeholders suggested the AESO consider developing fast recall product offered at a lower rate to the existing 7 min DOS

- Faster response capability is achieved with ancillary services
- DOS should not be considered an ancillary service
- The AESO procures required ancillary services competitively and does not obtain them indirectly through a transmission usage rate

Annual term for DOS

Proponents indicated that a one-year term for DOS is not long enough to make planning or investment decisions

- Current DOS term was intended to validate that the historical usage of DOS aligned with intention to use DOS capacity before granting the renewal
- Introducing dispatchable DOS removes the need for DOS to have a limited term
- With dispatchable DOS, a participant must actively manage their assets
  - Ex: customer has 10 MW DOS capacity to ensure compliance with ISO rules of dispatchable DOS capacity priced at the offer cap, and 20 MW of DTS capacity
  - To be compliant with DOS Terms and Conditions and energy market rules, the metered load at the site must be 30 MW when energy prices are below the offer cap
  - Conversely, if the price is at the price cap the DOS load must be curtailed by the bid amount

DOS take-or-pay requirement

Stakeholders question the continued need for a take-or-pay requirement

- The AESO is proposing to replace the transaction request with an energy market bid
  - To qualify for Rate DOS the AESO is proposing customers bid their DOS capacity into the energy merit order
  - Energy market dispatch compliance will prevent a Rate DOS participant from bidding for more DOS than will be used
- Dispatchable DOS bids effectively remove the need for the take-or-pay incentive
- Losses will continue to be assessed against DOS energy

Provision of ancillary services as a DOS customer

Some stakeholders requested the AESO clarify how DOS loads providing AS products would be managed

- DOS load would not be excluded from providing ancillary services
- By making DOS capacity dispatchable the AESO can use existing mechanisms for reserving capacity from ancillary service resources
  - For example, when a resource is dispatched for operating reserve that capacity is automatically removed from the energy merit order
  - During an EEA event load dispatched for operating reserve would not be curtailed until EEA2

Availability of capacity

Stakeholders suggested the AESO publish the location and availability of transmission capacity for DOS

- The AESO will not be prioritizing the development of this information as part of DOS modernization

AESO's DOS Modernization Recommendation

DOS Eligibility

DOS eligibility: Providing opportunity service while avoiding DTS cannibalization

- The AESO proposes to continue to require the provision of a business case to assess eligibility based on the eligibility criteria set out in the terms and conditions for the rate
- Eligibility assessment to include a combination of qualitative and quantitative measures:
  i. Technical Assessment
  ii. Business Case Assessment
  iii. Limited Use

Providing opportunity service while avoiding DTS cannibalization (cont.)

- Eligibility assessment to include a combination of qualitative and quantitative measures:
  - i. **Technical Assessment:** Continue to assess reliability impacts of taking DOS load at time of application
  - ii. **Business Case Assessment:** Continue to provide a business case explaining the need and use for DOS energy
    - Demonstrating that the energy would not be consumed if not for DOS
    - Indicating MW requested and maximum MWh/month or MWh/yr
  - iii. **Limited Use:** Create a quantitative measure of use of DOS that removes some of the subjectivity
    - Replace temporary or repeated short-term criteria
- This combination balances enabling DOS while discouraging the cannibalization of DTS for DOS

Technical assessment

- The technical assessment at time of application is done for reliability reasons and not to determine if and when DOS capacity would be available
- The AESO will continue to perform this assessment on any new or revised DOS application
- The AESO is proposing to make the DOS application part of the SASR process
  - The requirements specified within Alberta reliability standards (ARS) will drive the breadth of the study scope of a new or modified connection

Business case assessment

- The business case assessment will remain a qualitative assessment
- When reviewing the business case at the time of application the AESO will assess
  - Is the business case plausible?
  - Is there a convincing case that the customer would forgo the opportunity:
    - Under Rate DTS?
    - If DOS were not available?

Quantitative measure to replace temporary or repeated short-term use

- The AESO recommends replacing the temporary and short-term use requirement with a maximum load factor for DOS energy
- AESO identified three ways to guide an appropriate maximum usage level for DOS:

1. **Historical DOS usage**
   - Historical DOS usage as an indication of what future use should be
2. **Ratio of actual energy use compared to DTS capacity**
   - The unused capacity that exists because customers infrequently use all the capacity they pay for could be available for DOS
3. **Statistical assessment of system load use**
   - Infrequent use of the system occurs in the hours where load is one standard deviation above the average load

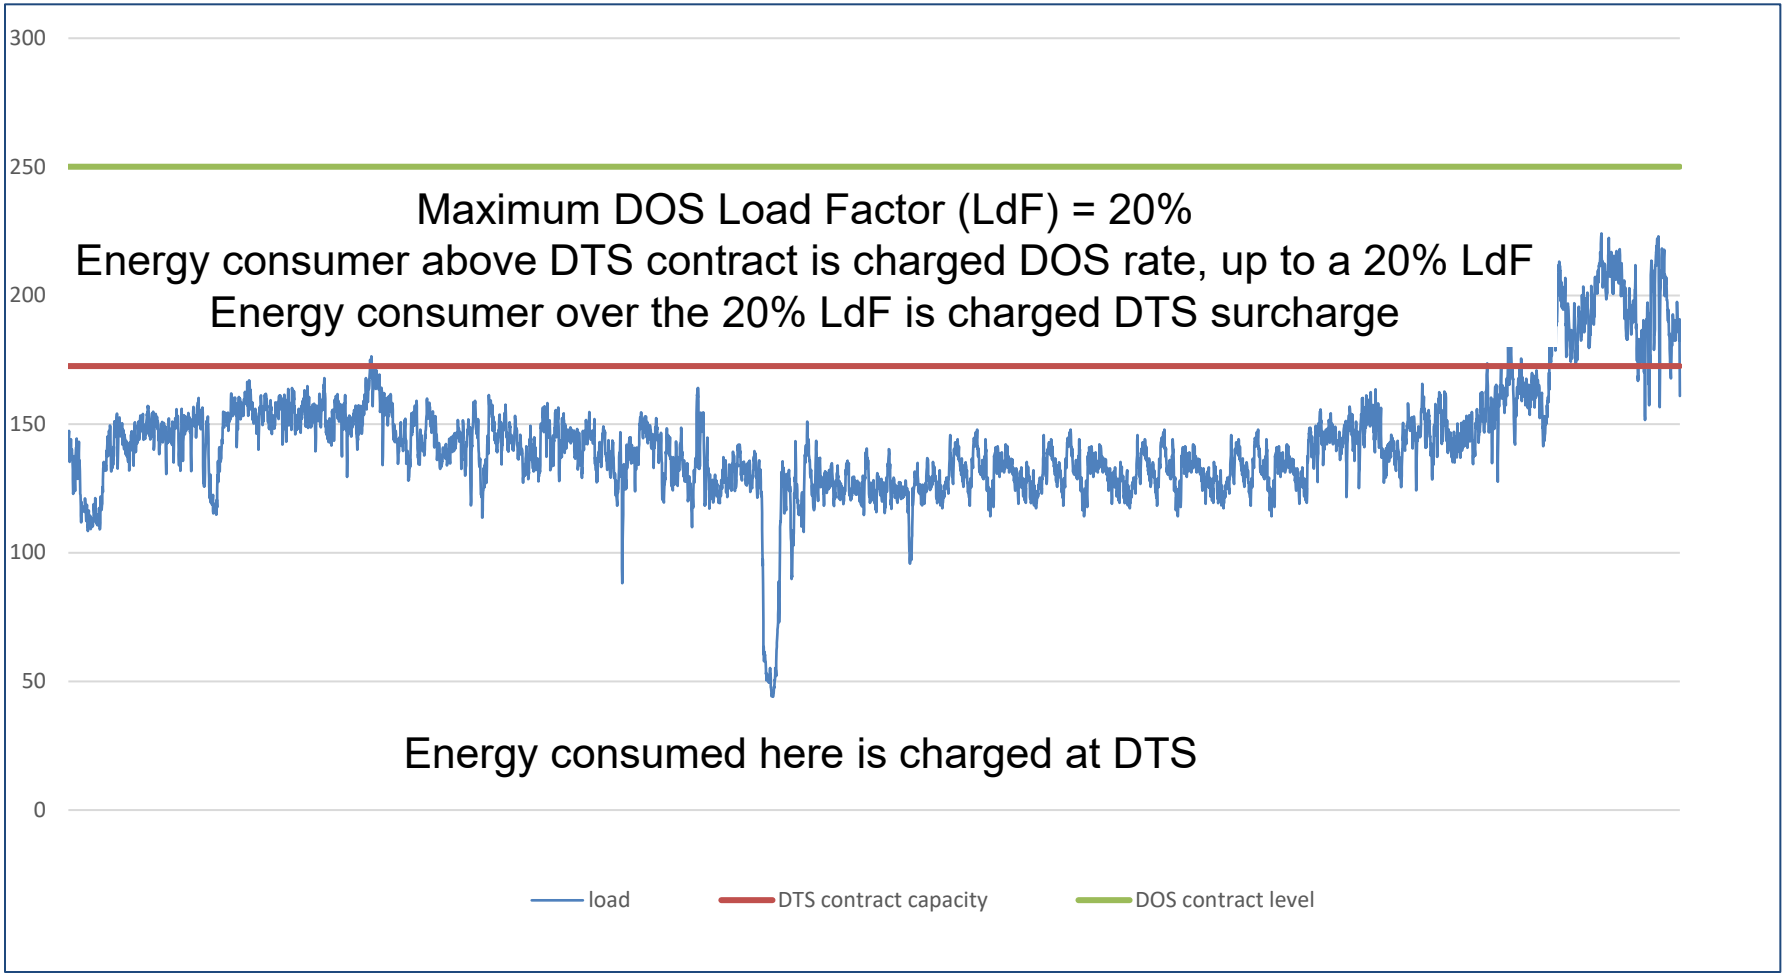
- Using these three guides the AESO proposes to develop a quantitative measure for this criteria

DOS maximum load factor

- Historical DOS utilization shows maximum load factors of 30 per cent monthly and 15 per cent annually
- Usage ratio of DTS energy consumed to DTS capacity (1 - ratio) indicates 23 per cent
- A statistical assessment of load - one standard deviation from the mean is 18 per cent (~~2017~~ 2007– 2019)

- **Given this guidance the AESO proposes a maximum annual load factor of 20 per cent for DOS load**

DOS maximum load factor – Example



* *DTS surcharge settlement is explained on the following slide*

Proposed modifications to DOS settlement given the new eligibility criteria

- Charges to DOS customer:
  - Energy consumed above the DTS contract levels will be charged at the DOS rate up to the maximum DOS load factor
  - Energy consumed above the maximum DOS load factor will be charged at DTS Surcharge rate
  - DTS Surcharge is equivalent to the current DOS Term rate in only as it relates to the $/MWh charge
    - DOS Term rates capture full DTS costs in a $/MWh form

AESO assessment summary

- **Technical assessment**
  - Taking DOS energy does not impact voltage and transient stability
- **Quantitative assessment**
  - Max load factor >= expected DOS load factor of customer
  - Max connection capacity >= DTS + DOS contract capacity
- **Qualitative assessment**
  - Is the business case for use of DOS plausible
  - Is there a convincing case that the customer would forgo the opportunity
    - Under rate DTS
    - If DOS were not available

Quantitative methods to replace temporary or repeated short-term use

- Temporary and short-term use requirement to be replaced with a more quantitative assessment
- Using the three guides the AESO proposes a quantitative measure for this criteria
  - **a maximum annual load factor of 20 per cent for DOS load**

DOS Connections

Applying for DOS

- The AESO proposes that the DOS application be included in a participant's SASR
- There are currently three processes for SASR:
  1. Connection Process applies to new connections
  2. Behind the Fence (BTF) Process applies to participant changes to existing facilities
  3. Contract Process applies to changes to SAS contract capacity
- The AESO proposes to modify the SASR and the SAS processes to include DOS requests

DOS for connections

- New connections
  - The AESO recommends the DOS capacity be assessed as part of gaining system access service or when participants change contract capacity
  - The pool participant will be provided a dispatchable sink asset with a maximum capability equal to the contracted DOS capacity for the purposes of energy market participation
  - The participant is responsible to manage the asset
  - Should the market participant wish to increase or reduce that capacity, those changes would be managed through the existing contract and asset management processes
- Existing connections
  - The AESO proposes to adapt the current SASR contract process to include DOS

DOS Transactions

Modernizing the operation of DOS

- The AESO is recommending to shift the operation requirement for the DOS rate from the tariff and into the energy market rules to rely on existing rules, procedures and practices
  - Export Opportunity Service and Import Opportunity Service have their real-time market operation defined within the energy market rules
  - The notification and recall requirements of the existing Rate DOS reflect capabilities of load market participants that existed over two decades ago
- Bid submissions would make DOS capacity continuously visible to system operators and more easily integrated into automated system studies and operation on a real-time basis
- AESO is proposing to include DOS loads as part of the energy market merit order with asset specific ramp rates

Suspension of DOS

Suspension of DOS

- Failure of an AESO audit
  - The AESO will retain the ability to audit a DOS customer
  - Examples of audit failure:
    - Use of DOS during a self-supply generator unplanned outage or derate
    - Consistently exceeding maximum annual load factor on DOS load
    - Exceeding combined DTS and DOS contract capacity
    - Operating in a manner that is clearly inconsistent with application business case
- Non-compliance to an AESO directive
  - Directives are made for safety or reliability reasons
  - Dispatch non-compliance would not necessarily result in suspension of DOS
    - Rule non-compliance is assessed by the AESO and referred to the MSA

Streamline of DOS Rates

One hour DOS is redundant

- The AESO is recommending removing the 1-hour DOS type
- 1-hour DOS has gone unused since 2004
- The proposed Dispatchable DOS design that dispatches load based on a participant submitted ramp rate removes the need for a rate-specific response time

Dispatchable term DOS

- Term type DOS is intended for sites looking to take planned outages of their self-supply generators and rely on the grid for back-up power supply
- The AESO proposes to keep the term DOS rate for this purpose but replace the current transaction request process with an energy market bid
- DOS energy cannot be used to serve load during unplanned generation outages or derates

Summary

Review | Summary of proposed changes

Measures	Remove	Add	Leave
Prevent DTS cannibalization from DOS	Annual term and fee, temporary or short-term usage	Load factor eligibility limit	DOS capacity terms, alt energy source or market opportunity (w/ business case), audit and disqualification
Assess available capacity for DOS	Monthly energy transaction request	DOS request in SASR, bidding requirement for DOS load (dispatchable DOS)	Reasons for DOS energy recall
Recallability of DOS	Monthly energy transaction request, 7 min and 1 hour and term DOS (combine to dispatchable DOS), Transaction fee	Recall in accordance with ISO rules (dispatchable DOS)	
Settlement of DOS	Take-or-pay requirement	DTS surcharge for exceeding load factor limit Operating reserves charged in same way as Rate DTS	Term Type DOS rate, Metered energy check, losses charged to DOS

What We Heard and AESO DOS Modernization Recommendation

Next Steps

Engagement schedule

- **March to June 2021 |** Targeted Mitigation Engagement – Continue to work with those customers that are expected to experience a transmission cost impact of 10 per cent or more
- **May 28, 2021 |** Stakeholder feedback due on questions set out in Stakeholder Comment Matrix Session 5B (DOS)
- **June 3, 2021 |** Host stakeholder engagement session to discuss Session 5 stakeholder feedback or follow-up and key questions raised by Commission staff, and to provide additional clarity and build mutual understanding of the AESO's preferred rate design and stakeholder concerns
- **June 24, 2021 |** Host stakeholder engagement session to discuss AESO's targeted mitigation discussion outcomes, Session 5B (DOS) and Session 6A stakeholder feedback, and areas of alignment
- **October 2021 |** File application with AUC for public proceeding and approval

Session feedback

- We want to thank you for attending the Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS) and we would appreciate your feedback on the session
- We invite all interested stakeholders to provide their input on this session via the questions set out in the **Stakeholder Comment Matrix Tariff Session 5B (DOS) on or before May 28, 2021**. The matrix will be available on May 13, 2021 on our website at www.aeso.ca.
  - Path: Stakeholder Engagement > Rules, standards and tariff consultations > Tariff (filter) > Bulk and Regional Tariff Design > Session 5B (DOS) | May 20, 2021

June sessions

- The next session (Session 6A) will be hosted on **June 3, 2021**. Registration details are now available on our website
- **Session 6A purpose**
  - The purpose of this session is to engage stakeholders in a discussion of Session 5 stakeholder feedback or follow-up and key questions raised by the Alberta Utilities Commission (AUC) staff, and to provide additional clarity and build mutual understanding of the AESO's preferred rate design and stakeholder concerns.
- **Session 6A objectives**
  - Share our learnings on Session 5 stakeholder feedback or follow-up
  - Present and seek stakeholder input on additional information on preferred rate design, including analysis of the potential response to the incentives provided in the rate design
  - Present responses to key questions raised by AUC staff
  - Seek to understand outstanding stakeholder concerns

June sessions cont.

- Following Session 6A, the AESO will host Session 6B on **June 24, 2021.** Registration details will be available at the end of May on our website
- **Session 6B purpose**
  - The purpose of the session is to engage stakeholders in a discussion of the AESO's targeted mitigation discussion outcomes, Session 5B (DOS) and Session 6A stakeholder feedback, and areas of alignment
- **Session 6B objectives**
  - Provide an overview and seek stakeholder input on the outcomes of the targeted mitigation engagement
  - Share our learnings and seek stakeholder input on Session 5B (DOS) and Session 6A stakeholder feedback and areas of alignment
  - Present and discuss implementation considerations
  - Seek to understand outstanding stakeholder concerns

Appendix 1 – DOS Usage Statistics and Comparison to Other Opportunity Service Rates

Historical DOS statistics

Number of transaction requests by type:

Type	# of Sites	# of transaction requests
DOS 7 minute	31 (2 sites currently)	2501
DOS 1 hour	11 (last used in 2004)	207
DOS term	22 (1 site currently)	66

Number of recalls by reason:

Year	Reason	# of DOS recalls
2006 - 2012	Supply Adequacy	32 EEA events
	Constraint and Voltage	70
2013 - 2021	Supply Adequacy	41 EEA events
	Constraint and Voltage	1

Export Opportunity Service (XOS) background

- Exports are charged greater of:
  a) $8.28/MWh x interchange transaction for the month + intertie loss charges, where

     intertie loss charges = sum of intertie loss factor x hourly interchange transaction MW x pool price

  b) A take or pay amount equal to the sum of $7.33/MWh x 75 per cent of scheduled capacity + the sum of 75 per cent of scheduled hourly capacity x pool price x intertie loss factor
- Like DOS the rate was derived from DTS
  - Rate DTS costs are first converted, by component, to $/MWh charges
  - The export opportunity rates are then allocated the variable components of costs which are caused by exports when they occur, as well as a contribution to fixed costs (20 per cent)

Appendix 2 – Load Factor Determination

Historical DOS use

- Historical DOS utilization shows maximum load factors of 30 per cent monthly and 15 per cent annually
  - Based on data from 2001 to 2020

Statistical assessment guide

The one-sided normal distribution of all DTS load in 2019 revealed:

	MW	# of Hours	% of Hours
Average	6,812.79	4231	48.3%
Average + 1 St Dev	7,432.16	7220	82.4%
Average + 2 St Dev	8,051.53	8631	98.5%
Average + 3 St Dev	8,670.90	8760	100.0%

- Per cent of the hours within one standard deviation for 2018 is 83.5 per cent and 2017 is 81.8 per cent
- The AESO surmises that load greater than one standard deviation is a reasonable measure of infrequent use acknowledging the use of DOS should be infrequent

Usage ratio guide

- System built to serve 100 per cent of in merit energy
- Load pays for that system
- Real-time utilization of the system is coordinated through dispatch of the market
- DOS is a tool for DTS customers to “sell” the unused capacity and the proceeds of the sale applied as a reduction to cost of DTS
- The ratio of DTS energy consumed to DTS capacity is another proxy for the level of energy use that is temporary or short-term
- Usage of DTS energy consumed to DTS capacity equals 23 per cent

Appendix 3 – Dispatch and Dispatch Compliance

Distinction between dispatchable and controllable

- Dispatchable Assets are:
  - All source assets 5 MW or greater
  - All sink assets participating in DOS (DOS capacity must be at least 5 MW)
  - Any sink assets 5 MW or greater that choose to be dispatchable
- Controllable assets are dispatchable assets that can comply with dispatch instructions within the allowable dispatch variances (i.e., +- 5 MW)
- When an asset request is made the AESO makes an assessment as to whether the asset is controllable or not. This decision is often tied to the underlying technology
- For example:
  - Wind and solar AGFs are considered dispatchable but not controllable and therefore have different dispatch compliance rules than generating units
  - Energy storage* and loads with onsite generation are considered controllable

* AESO is proposing an alternative dispatch compliance method for Energy Storage and VER Hybrids

Dispatchable DOS advantages

- Dispatchable DOS loads participate in the energy market by submitting a bid for the approved Rate DOS transaction capacity. Doing so accomplishes two things:
  1. It simplifies the DOS for real-time operations because the in merit bid volume indicates the amount of DOS load being served in real-time and provides a curtailment order based on bid price
  2. Bidding DOS load ensures the load under Rate DOS is truly curtailable, leveraging the existing ISO rule and compliance processes rather than build duplicative curtailment requirements within terms and conditions of the DOS rate
- Should DOS capacity become unavailable, or restricted, the system controller has the ability within the existing tools to “limit” the DOS consumption in accordance with congestion management protocols through mitigative measures such as directives or automated schemes
- Failure to comply to an ISO directive to curtail DOS could result in suspension of DOS participation and a recalculation of the DTS contract capacity, administrative penalties, and the recovery of DTS revenue charged while under DOS

Dispatchable load bidding

- Note, the AESO anticipates proposing recommended changes to the current ISO rules for bidding as described in division 203 – Energy Market of the ISO rules, through the Energy Storage Rule Amendments initiative. Stakeholders will be engaged in consultation on proposed amendments to the ISO rules at that time

Appendix 4 – Eligibility Options

DOS eligibility options evaluation

Accepted	Pro	Con
Maximum annual load Factor	Provides certainty; mitigates risk of excessive DTS cannibalization	Not an accurate measure of individual energy for market opportunity
Application business case	Able to characterize unique market opportunity for opportunity service	Evaluation somewhat subjective, uncertainty of acceptability
Eliminated	**Pro**	**Con**
Third party audit of market opportunity	Ability to evaluate unique market opportunities	Costly to user
Owner attestation	Places evaluation with customer who is best able to evaluate market opportunity	Structuring an effective attestation may be difficult
Post use audit	Able to evaluate with actual information on use of opportunity service	Uncertainty of outcome and cost for user
Timing limitations on DOS/DTS contract changes	Provides certainty on the opportunity nature of the energy use	Limits ability to take advantage of opportunity during time limitations; time limitation may be somewhat arbitrary
AUC approval	Authoritative	Uncertainty of outcome and cost for user

Appendix 5 – Acronyms

Acronyms

- AGF = Aggregated Generating Facilities
- AIES = Alberta Interconnected Electric System

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 31, 2021	**Contact:**	Company Representative
Comments From:	Company Name			**Phone:**	Contact Phone Number
Date:	[yyyy/mm/dd]			**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	
6.	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Demand Opportunity Service (DOS) Bid Examples

Purpose

The purpose of this document is to build on the DOS modernization recommendation explanation of DOS load bidding in the energy market, provided during the Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS) hosted by the AESO on May 20, 2021. The examples are intended to provide an overview of how DOS load could bid in a simple manner, recognizing that more sophisticated bidding strategies could be developed.

The information contained in this document is provided to stakeholders in the Bulk and Regional Tariff Design engagement for information purposes only and to further stakeholder understanding of the information presented at Session 5B (DOS) on May 20, 2021. The information in this document is not intended to be used or relied upon for any other purpose.

Bid submission and dispatch

Loads, using a dispatchable sink asset provided by the AESO, are able to bid into the energy market as a means of having their consumption dispatched in line with the price levels submitted through their bids. Bids are submitted with volume and price pairs like offers, where the bid indicates the volume of energy the sink will consume when price is below the bid price, and correspondingly indicating how much load will reduce should price exceed the bid price. Unlike offers, bids will not be paid for their response. Bid submission operates at the inverse to energy market offers.

Like energy market offers from a source asset, a participant may bid up to seven blocks of energy from a sink asset. Those seven blocks are then assigned to a dispatchable sink asset. For energy market offers, block zero is always the lowest priced block submitted. For bids, block zero is always the highest priced block submitted. Subsequent bid blocks are at least one cent lower in price than the previous block.

Bid blocks are “dispatched on”, meaning load is dispatched to consume, when the block price is above the system marginal price (SMP). Bid blocks are “dispatched off”, meaning load is dispatched to reduce, when the block price is at or below the SMP. When a bid block is “dispatched on” it means the energy in that block can be consumed as price has not yet reached the bid price, and the overall load should increase by the block size. When a bid block is “dispatched off” it means the energy in that block is to no longer be consumed as the price is above the bid price and the load should decrease by the size of the dispatched block.

Figure 1 below provides two different examples of bids for a 30 MW sink asset. The “in-merit” bid indicates the participant wants to be dispatched in much the same fashion as a “price-taker” offer by placing all the block MW at the energy market price cap. The “out-of-merit” bid indicates the participant does not want to be dispatched to consume by placing the bid block MW at the price floor.

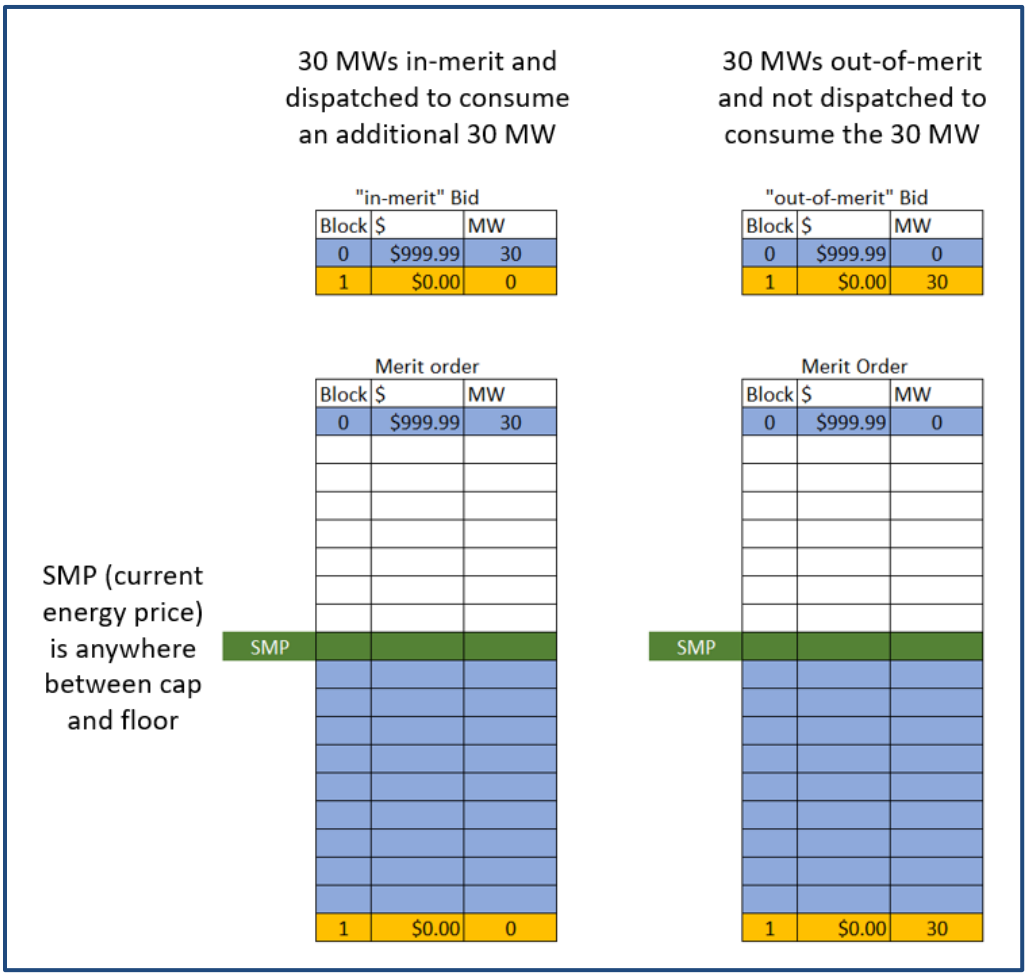
@theaeso

Figure 1: Bid prices and dispatch

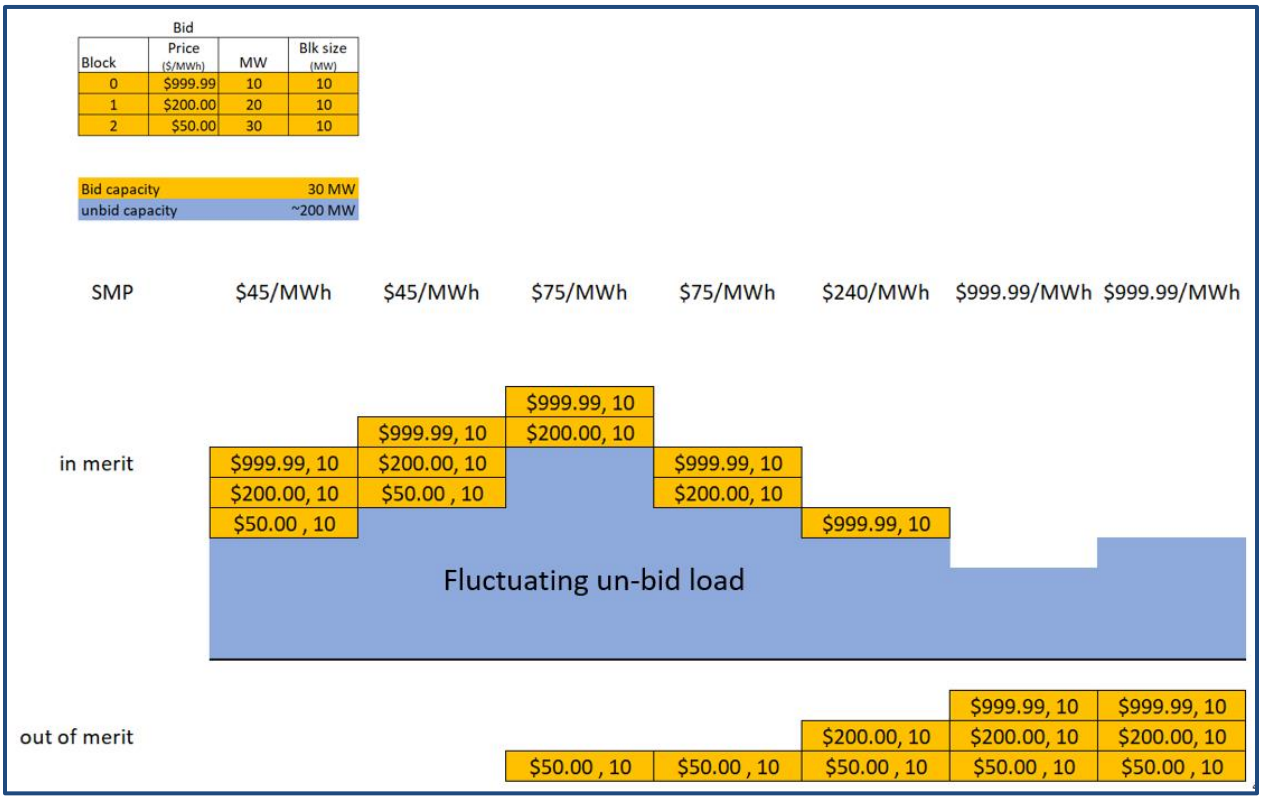


The “must offer” requirement that applies for energy market offers, which requires all available capacity to be offered into the market does not directly apply for energy market bids. For sink assets in the energy market, bids may be submitted for all or part of the load attributed to the participant. Because of this bid feature the concept of “must bid the entire load” does not apply like “must offer” does for generators. However, the requirement to comply (i.e., “must comply to the dispatch instruction”) applies to both bids and offers.

The compliance requirements for bids are less stringent than those for offers. This is because the nature of bid load is dependent on the underlying base “un-bid” load. It is not possible to measurably distinguish un-bid load from the bid-in load because the load measurement only captures the total load at the dispatch point. This is illustrated in the following example shown in Figure 2.

Public

Figure 2: Bid dispatch and effect of underlying un-bid load on total load level



Dispatched bid load floats on top of the un-bid load. The metered demand represents the sum of the un-bid and bid load. For example, the AESO may dispatch on the bid load while at the same time the un-bid load is dropping. If this occurs it appears as if the participant did not adequately respond to the dispatch on instruction. Conversely, if the un-bid load is increasing at the same time as the bid load is dispatched on it appears as if the load increased to a level much greater than the dispatch. Because of the unpredictable nature of the un-bid load, the rules are relatively silent on what constitutes bid compliance.

For example, in Figure 2 when the system marginal price (SMP) increases from $45/MWh to $75/MWh, block two (the 10 MW block priced at $50.00/MWh) is dispatched off and the load would be expected to decrease by 10 MW, but according to the real-time measurements the load increased by 10 MW. The price then jumps from $75/MWh to $240/MWh and the load would be expected to decrease another 10 MW following the dispatch instruction to do so. The price continues to climb to the price cap at $999.99 at which point the remaining 10 MW in block zero is dispatched off and the load would be expected to decrease another 10 MW. Meanwhile, fluctuations in the un-bid load occur.

Treatment of DTS and DOS capacity within a bid

The AESO's DOS modernization recommendation uses the bid as the means to replace the transaction request where the bid acts as an on/off switch for intent to use DOS capacity. The "dispatch on" would represent the start of the DOS transaction and the "dispatch off" would represent the end of the same transaction.

Public

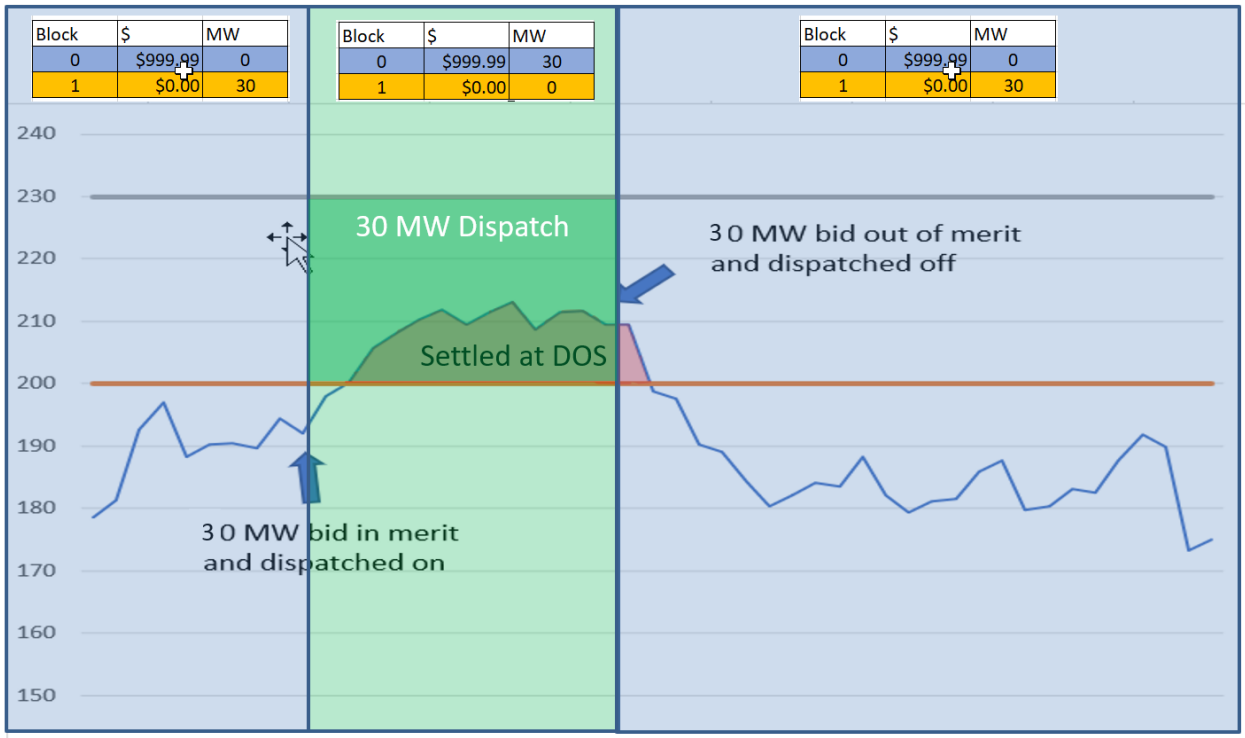
The AESO will assign the DOS participant with a sink asset whose capacity is equal to the volume of DOS contract capacity with which to submit a bid. The simplest way to approach bidding for the purposes of indicating the use of DOS capacity is for the participant to submit a bid with two blocks. Block zero is priced at $999.99/MWh and block one is priced at $0.00/MWh.

- If the participant is not planning to take DOS capacity in an hour the $0.00/MWh block will hold the DOS capacity and the $999.99/MWh block will have a block MW equal to zero. This effectively sets the DOS transaction switch in the off position.
- If the participant wishes to utilize the DOS capacity, the participant will move all, or the portion of the DOS capacity that the load wishes to consume, from the $0.00/MWh block to the $999.99/MWh block. This effectively sets the DOS transaction switch in the on position, for the amount of DOS capacity the participant wishes to use.

Toggling the energy between the two blocks will indicate to the system controller when the participant is taking or planning to take DOS energy and how much volume.

In the example shown in Figure 3, the participant starts off taking only DTS capacity by placing the 30 MW of DOS capacity in block one at $0.00/MWh. As per Section 203.3 of the ISO rules, *Energy Restatements*, at least two hours in advance of the hour the participant intends to use the DOS capacity, the bid for that hour is modified so the 30 MW of DOS capacity is priced at $999.99/MWh. At the top of the hour the bid will be in-merit and the system controller will issue a dispatch to the participant. This is equivalent to the start-time within the current DOS transaction request. The participant can leave the capacity in block zero for as many hours as the participant intends to use the DOS capacity.

Figure 3: Bid dispatch activates and deactivates the DOS transaction



Public

If the participant no longer wants to use the DOS capacity, the participant will move the energy from block zero ($999.99/MWh) into block one ($0.00/MWh) at least two hours in advance, as described in Section 203.3 of the ISO rules, *Energy Restatements*. At the top of the hour the system controller would dispatch the $999.99/MWh block off signaling to the participant that the DOS transaction has ended.

In the above example (Figure 3) it would appear the participant did not comply with the 30 MW dispatch instruction. Even though the bid was dispatched on for 30 MW, a maximum of 12 MW of DOS capacity was taken over the period. As explained in the example shown in Figure 2, the bid capacity was dispatched on but the underlying un-bid load was dropping off resulting in a net change of only 12 MW.

In the event the participant can no longer take DOS capacity due to an acceptable operating reason and wants to end the DOS transaction prematurely, the participant can, at any time, restate the volumes in the block and the system controller will dispatch the load off.

Settlement considerations of dispatch

If the DOS capacity was dispatched for any part of the hour, the hourly metered volume at or below the 200 MW DTS contract capacity will be settled in accordance with the DTS rate and the meter volume above the DTS contract capacity will be settled in accordance with the DOS rate.

Tariff settlement does not consider dispatch compliance, but DOS settlement is determined based on whether or not the DOS capacity was dispatched on.

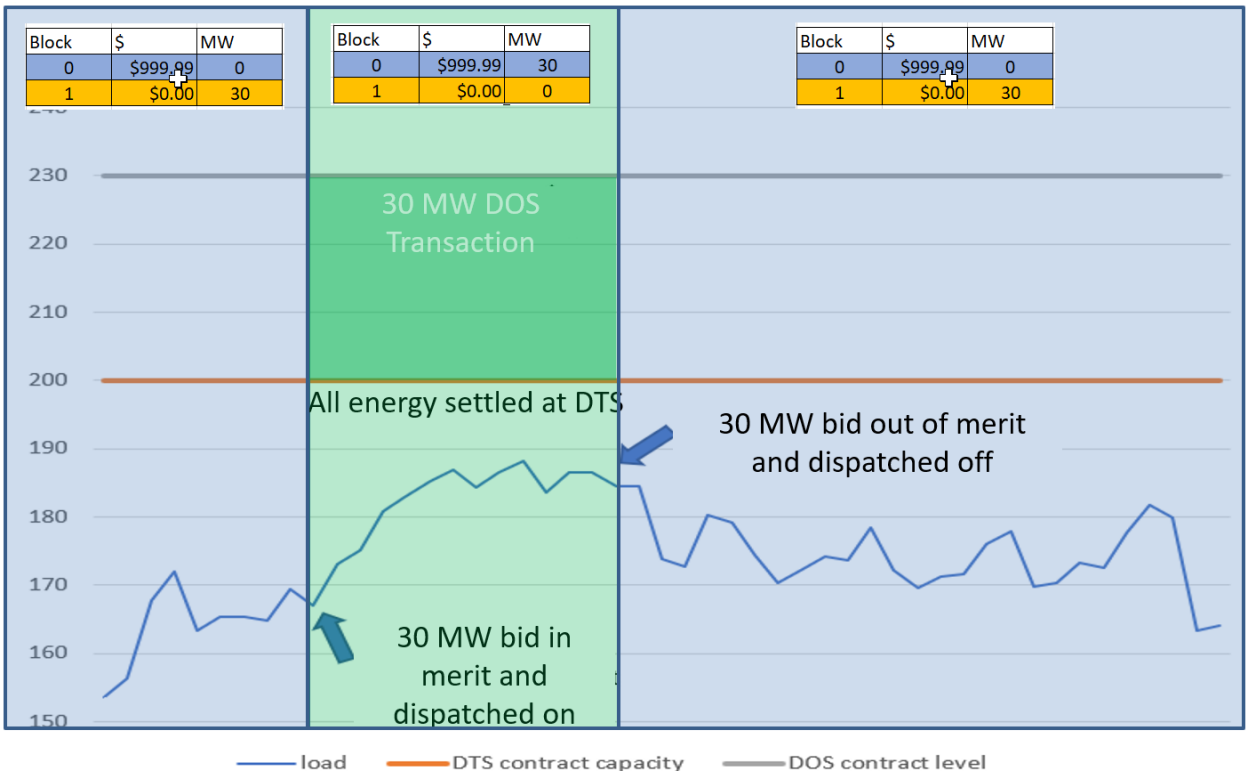
Dispatch without using the DOS capacity

Like in the previous example, in Figure 4 below, the participant submits a bid with two blocks. Block zero priced at $999.99/MWh and block one priced at $0.00/MWh. If the participant is not looking to take DOS capacity in the hour the $0.00/MWh block will hold the DOS capacity. If the participant wants to utilize the DOS capacity, the participant will move all or a portion of the DOS capacity from the $0.00/MWh block to the $999.99/MWh block.

The participant starts off taking only DTS capacity by placing the 30 MW of DOS capacity in block one at $0.00/MWh. As per Section 203.3 of the ISO rules, *Energy Restatements,* at least two hours in advance of the hour the participant intends to use the DOS capacity, modifies the bid so that the 30 MW of DOS capacity is priced at $999.99/MWh. At the top of the hour the bid will be in-merit, and the system controller will issue a “dispatch on” to the participant and acts as the start-time of the current DOS transaction request. The participant can leave the capacity in block zero for as many hours as the participant intends to use the DOS capacity. However, in this example the participant’s load never exceeded the DTS contract levels the entire time block zero was in-merit and the 30 MW of load dispatched on. In accordance with the proposed DOS modernization rate design, the hours where the capacity in block zero was in-merit will all be settled at Rate DTS as no DOS capacity was actually utilized.

Public

Figure 4:DOS energy is energy consumed above DTS levels

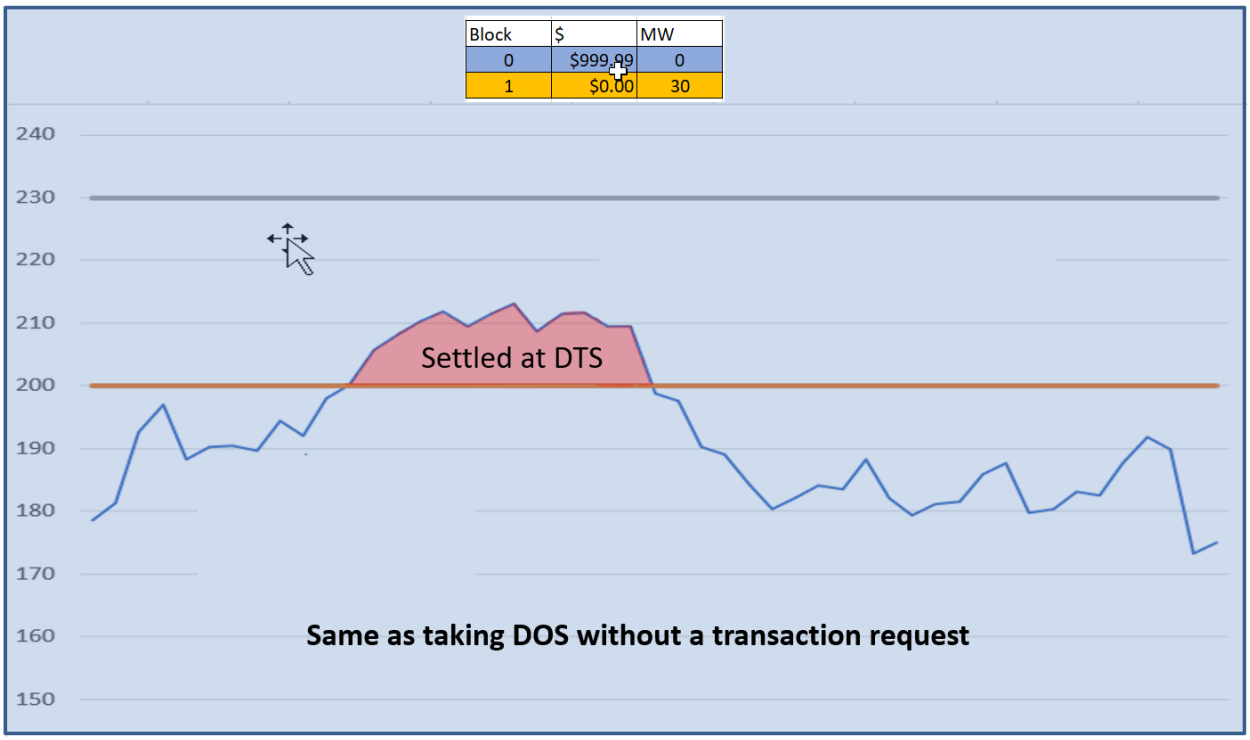


Using DOS capacity without a dispatch

In the proposed DOS modernization rate design, using DOS capacity without a corresponding dispatch is the same as using DOS capacity without submitting a transaction request under the current DOS rate. In both cases, all energy consumed above the DTS contract capacity will be allocated to DTS rather than DOS. For example, as shown in Figure 5 below, if the participant bids all MWs in block one, those MW remain out-of-merit and would not receive a dispatch on, assuming the price remains higher than $0.00/MWh. All energy consumed in this example would be assessed to Rate DTS.

Public

Figure 5: Using DOS capacity without a bid dispatch



Recalling DOS energy for constraint

If the participant has energy in the $999/MWh block and there is a need to recall the DOS capacity, the system controller would direct all or a portion of the $999/MWh block off by reducing the size of the block. The participant would receive a signal from the AESO's dispatch system (ADAMS) indicating the reduction in the available DOS capacity and a directive to only consume the remaining capacity, if any. When the capacity is restored the system controller will restore the volume in the energy merit order bid and the participant will be re-dispatched according to merit order.

The recall instruction is an instruction to not consume DOS capacity. It is not necessarily an instruction to reduce load. The participant load may already be below the DTS contract levels and there is no need to reduce load further. It will be the participant's responsibility to ensure the load is reduced to the appropriate level and sustained there. For example, if the directive was to no longer consume the entire 30 MW of DOS contract capacity the participant would need to ensure the total site load did not exceed DTS contract levels until dispatched to do so.

Recalling DOS energy for an EEA 1 alert

If the bid volume is priced at the top of the energy market merit order ($999.99/MWh) these are the last blocks dispatched before taking out of market actions to maintain system reliability during a supply shortfall. The instruction during an Energy Emergency Alert (EEA) 1 alert will be a dispatch off, to stop consuming energy in the $999.99/MWh block. Like the constraint recall example above, it will be the

Public

participant's responsibility to know whether they are consuming DOS energy at the time of the dispatch or not. The instruction is an instruction to stop consuming DOS energy and continue to not consume any DOS capacity until dispatched on (price drops below $999.99), which may or may not require a physical load reduction.

Failing to comply to DOS recalls

Failure to comply to an ISO directive to curtail DOS could result in suspension of DOS participation and a recalculation of the DTS contract capacity, administrative penalties, and the recovery of DTS revenue charged while under DOS.

Market terminology

Market terminology used in this document is defined in the *Consolidated Authoritative Document Glossary* located on the AESO website here:

https://www.aeso.ca/rules-standards-and-tariff/consolidated-authoritative-document-glossary/

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021 through May 31, 2021	**Contact:**	Colette Chekerda
Comments From:	Alberta Direct Connect - ADC	**Phone:**	780-920-9399
Date:	[2021/05/31]	**Email**:	Colette Chekerda

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable in that DOS required it's own session, however clearer examples and description of how the DOS is expected to work would have been helpful.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	The ADC supports the initiative of moderninzing DOS, however the AESO proposal for DOS apears unnecessarily complicated and will continue to be underutilized in it's proposed form. The energy market compliance requirement to reduce the total block of DOS energy, even where that means to interrupt "firm" DTS load is not consistent with the intention of the tariff design. The dispatch should be a "down to" DTS contract level – similar to what the capacity market envisioned for load resources. The AESO's additional information may suggest this is how it would work in practice, but customers would need to be clear on compliance requirments. Further, the basis for the 20% load factor seems arbitrary. It is unclear what the purpose of the load factor requirement even is. If the participant meets the eligibility criteria for DOS, then it would be in the best interest of other rate payers that the volume be maximized to provide incremental revenues.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	ADC recommends the following modifications: *1. Remove the maximum load factor requirement* If the opportunity meets the eligibility criteria, and would be foregone revenue if the DOS is not granted, then it is in the best interest of ratepayers to maximize the use of DOS. *2. Eligibilty criteria should include a. a credible by-pass opportunity and b. should be extended to price responsive load.* First: If a load can demonstrate they would exit the grid in the absence of DOS, then DOS should be granted in this circumstance. This would keep more load on the grid, and delay grid defections, hopefully to the point where CTI projects have been depreciated and DTS costs become more attractive than a bypass option. Once a load makes the decision to defect from the grid, they are not coming back and their future revenue contribution is gone. Most loads do not want to be generators and are only doing so to remain competitive in Alberta. Although many parties/agencies are going to extreme lengths to hold loads hostage to an overbuilt transmission system (self-supply and export restrictions, adjusted metering practice that would move existing net metered sites to gross metered sites with a SASR change, the proposed DTS tariff), these restricitons will only lead energy intensive loads to more extreme measures to remain competitive. This includes moving production to other more attractive provinces or completely defecting from the grid. This result will be detrimental to Alberta ratepayers, the Alberta economy, jobs and future investment in the province. Second: Loads that demonstrate consistent CPD and energy market response should have that portion of their load eligible for DOS. This would result in several key benefits to all ratepayers. • Load retention and revenue enhancement: Energy intensive and trade exposed loads respond to price signals in order to remain competitive in Alberta. The proposed DTS tariff renders these loads uncompetitive. The mitigation solution needs to be a permanent rate option. An interruptible tariff is preferrable, however DOS could serve as a proxy with changes. Having qualified price responsive load granted DOS will keep these loads on the grid and continuing to contribute to the transmission revenue requirement. • Energy market stability: The 400 MW of price responsivle loads are aggressively responding to coincident peaks. This response is not

		confined to one 15 minute interval, but happens many hours each month. This creates several inefficiencies in both productivity for industrial facilities designed to maximize output, and inefficiencies in the energy market. • Productivity improvement: Having price responsive loads operate under a DOS tariff instead of DTS will enhance productivity and economic output of manufacturing facilties. This may increase the revenue contributed from these customers compared to the current DTS tariff while keeping their facilties viable in Alberta. 3. Allow a standing DOS bid in the energy market for 7 min DOS with a down to DTS contract level requirement under tx constraints or EEA events. Loads paying for firm DTS service should not have to remove a block of energy to below this level. Energy market rules would need to be developed such that compliance is not an issue if the site load level was at or below the DTS contract level. This appears to be the direction the AESO is moving based on the recent published examples, further exploration of the standing bid concept is required for DOS not used for planned generation outages. 4. Remove the loss factor charge. Losses are the responsibility of Generators, it is unclear what the AESO would do to publish and determine the loss factor for qualifying DOS load.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	The AESO DX-TX meeting of May 26, 2021 indicated that the AESO is intending on publishing transmission and substation capability maps to assist generators in deciding where to connect. This same work could be used for DOS customers to understand the capability in their area as well as a future outlook.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	No further questions
6.	Additional comments	DOS could provide an opportunity to grow into Alberta's transmission system. Using DOS with some certainty allowing customers to continue contributing revenue requirement. ADC would appreciate a response to the suggestions as to whether the AESO will consider and provide an explanation of why not. The ADC has provided several prior comment matrices on the proposed tariff and have not received any feedback on our comments or concerns.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 28, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable in that the AESO presented their existing and proposed DOS tariff.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	See response below.
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	The transmission system should be used efficiently and where possible, an opportunity service makes sense – but only if customers find the rate easy to use and there is an overall benefit to the system.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	No.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	No.
6.	Additional comments	None.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 31, 2021	**Contact:**	Rick Cowburn
Comments From:	CWSAA			**Phone:**	(403) 397-8785
Date:	2021/05/31			**Email**:	rcowburn@vidya.ca

Instructions:

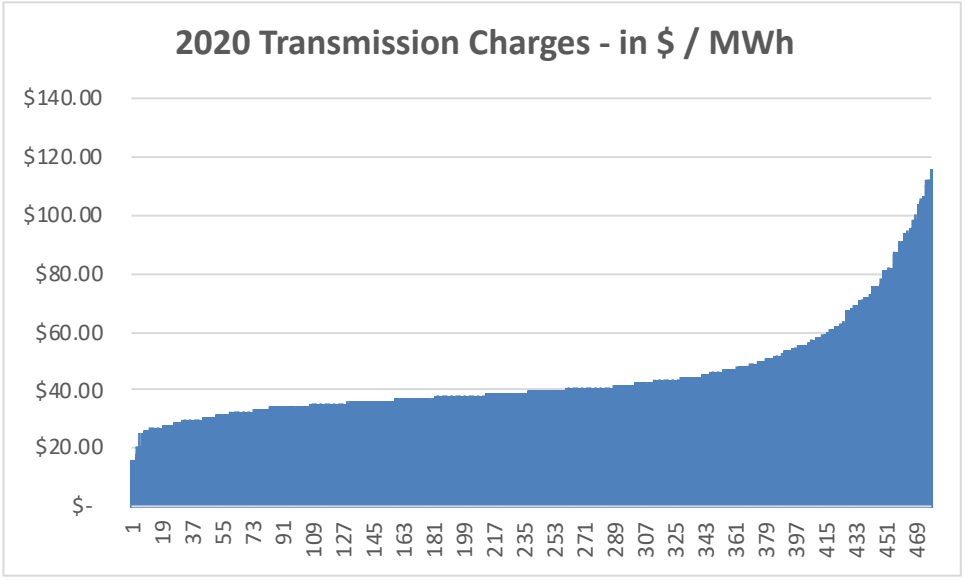
1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Yes, the session was valuable, and the AESO's presentation made the proposal reasonably clear for present purposes.

2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	No, this DOS recommendation cannot be supported as its paucity of clear, objective qualification criteria appears likely to further accelerate transmission revenue erosion and bring little if any net gain to customers. The original and enduring purpose of DOS is: "Available to customers who could clearly demonstrate that their use of the transmission system would not be economically viable at the rates otherwise applicable." [slide 16] As the Commission stated: "Consistent and reliable application of qualification criteria is essential to the success of opportunity rates. To improve the chances of the accrual of benefits to other customers, effective screening criteria and regular audits are required." [slide 17] What is the test for economic viability fundamentally about? < *Simplified Generator-Based Analysis* > Rather than getting lost in a theoretical ratemaking fog, consider a conceptual, simplified situation in which a customer has an inefficient generator that typically costs (say) $100 / MWh to operate (its capital costs are sunk and irrelevant to operations). We assume for discussion purposes that operating that generator would reduce transmission charges by $40 / MWh, for a net cost of $60 / MWh. If the Pool Price is over $60 / MWh, then it's cheaper to run the generator; if the pool price is under $60 / MWh, then it's cheaper to buy power from the pool and pay the transmission charges. The pool price determines when it is economically sensible to run the unit, as the market design intends. Now suppose that a DOS discount of $30 / MWh is offered on transmission charges, taking the marginal transmission cost down to $10 / MWh. The unit still costs $100 / MWh to operate, but doing so only saves $10 / MWh of transmission costs, for a net cost of $90 / MWh. So the effect of DOS is to move the pool price point at which the customer's generator would be operated. Without DOS, prices would have to be below $60 / MWh to turn on; with DOS, below $90 / MWh. In this simple situation, whether or not DOS has an overall customer benefit depends entirely on the pool price. When the pool price is in that $60 - $90 / MWh range, the DOS discount will turn off a unit that would otherwise have operated. Outside of that range, the DOS discount would have no impact on whether the unit should run.

		< Question: Overall Market Impact of DOS ? > Now comes an interesting question, which does not appear to have been recently considered: what is the **total** impact of DOS on customers? If the pool price is in the $60 - $90 / MWh range, the DOS discount could in effect shut down a unit which would otherwise have been run,and lead to taking more power from the pool (which after all is the whole point of DOS – to increase use of transmission, and hence to increase generation moving through the pool). Taking more power from the pool creates upward pressure on the pool price, so all Albertans taking power from the pool will tend to pay more as a result of the DOS discount. If this was a 10 MW generator, then using DOS to shut it down would add 10 MW X $13 / MWh = $130 per hour of additional transmission revenue. If shutting the unit down moved the pool price up by (say) $1, then the increase in pool prices could be on the order of 10,000 MW X 1 = $10,000 per hour. From a pool perspective, turning an on-site generator off has the same effect as turning a load on, and vice versa. A generator's economics are simpler than the economics of incremental customer production, but the question is the same. Seen holistically, it is not clear that DOS would bring an overall benefit to customers. It would be helpful if the AESO could consider this question and put the matter to rest – or raise it to consciousness. *< DOS Opportunities in a Market Context >* In practice, what is the magnitude of the DOS discount? Is it really significant enough to drive customers' production decisions, or is it just a subsidy? "The DOS rate is estimated to change from ~$5/MWh to ~$13/MWh under the preferred rate design." [slide 49] Analyzing the 2020 POD charge data provided by the AESO in Exhibit "25175_X0009_AppendixF-2020 Bill Impact Analysis", the average cost per MWh is distributed as follows:

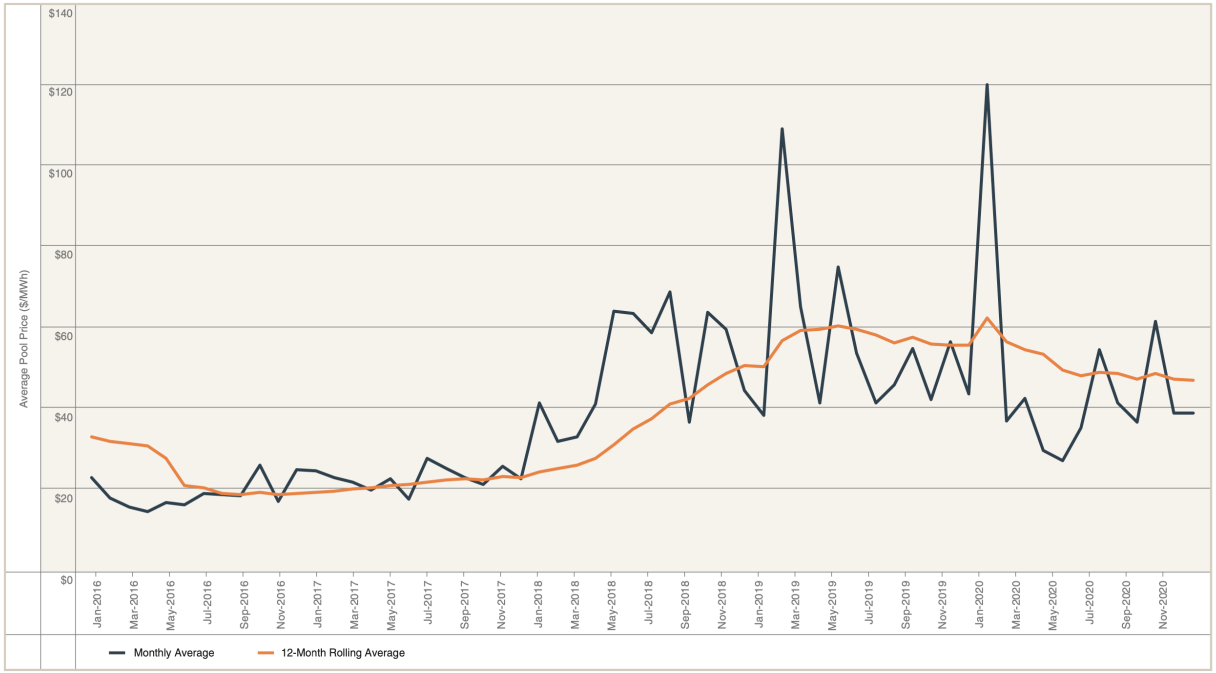


The median value is about $ 40 / MWh (omitting charges < $20/MWh and > $120/MWh), a rough high-level indicator of potential transmission savings. Of course in a real-world situation, the effective DOS discount could be much higher – or lower.

If DOS costs $13 / MWh, and transmission costs $ 40 / MWh, then DOS is providing a customer discount on the order of $ 27 / MWh.

The AESO's 2020 Annual Market Statistics report provides a context to consider such a DOS discount:

FIGURE 1: Monthly average pool price



It appears that month-to-month variations in pool price are often of the same order of magnitude as the example's DOS discount of roughly $27 / MWh.

"The original EAL* tariff application described opportunity service as

- A short-term temporary service, provided on an as-available basis
- Available to customers who could clearly demonstrate that their use of the transmission system would not be economically viable at the rates otherwise applicable
- Used for short periods, in order to avoid the impact of contract demand or ratchet charges that would otherwise result" [slide 16]

DOS is looking for situations in which a $27 / MWh short-term discount determines whether additional product will be produced – or not. Such situations will likely be very rare, as production which would be curtailed by a $27 / MWh transmission charge would presumably also be curtailed if pool prices increased by $27 / MWh. It is therefore not surprising that DOS has been little used over time, as in the

		scheme of things the discount offered is not that large and the economic qualification criteria will seldom be met. < *DOS Qualification Criteria* > It bears repeating that "the Energy & Utilities Board agreed and went further to state - Consistent and reliable application of qualification criteria is essential to the success of opportunity rates - To improve the chances of the accrual of benefits to other customers, effective screening criteria and regular audits are required" [Slide 17] The AESO has proposed a three-part qualification framework: i. Technical assessment, ii. Business case assessment and iii. Limited use. i. **Technical Assessment:** As a result of past government policy decisions, Alberta has a large, long-term surplus of bulk and regional transmission capacity. Physical supply will seldom constrain DOS; this test provides little if any protection against revenue erosion. It is good to know that DOS will not be considered in future system planning, but the problem is with the existing system, not future builds. ii. **Business Case Assessment**: It is profoundly concerning that this "will remain a qualitative assessment", that is to be "plausible" and "a convincing case." Determining whether a DOS discount really drives a production decision will generally be a profoundly difficult exercise, not unlike the analysis required in a rate regulatory proceeding. Where a facility produces a commodity whose prices are publicly visible, the **revenue** side of the business case can be objectively assessed, and should be a major driver of the qualification calculations. When commodity prices are low, there will be a flood of applications – but if commodity prices rise, will the AESO be watching, and rescind DOS 'deals' that are no longer economically necessary to justify additional production? Should the DOS discount not move when commodity revenues move? The **cost** side is much messier, as regulatory analysts know only too well. To objectively determine incremental productions costs requires 'picking out' all the incremental cost items and assessing them against reasonable norms. This is hard enough to do in the electric industry where business operations and costs are very well and publicly understood; in unfamiliar industries with multi-national reach and a broad range of activities, it would be extremely difficult except in rare, clear cases. The business case assessment also raises questions of competitive fairness. Facility A has high internal costs, and at current market revenues cannot operate its idle capacity without the DOS discount. But facility B down the road has lower internal costs,

		and does not really need the DOS discount to operate its idle capacity at a profit. So does the inefficient operator get the subsidy, while the efficient operator does not? Or do we subsidize an entire industry segment, treating all alike? And do we care at all about and seek to monetize the environmental impact of bringing old, inefficient facilities back into production? The fundamental premise of DOS is that customers maintain idle production capacity, ready to leap into action when a discount is offered. Really? The infrequent use of DOS suggests that this is a rare situation, as one would expect. There is no evidence that there are a substantial number of unrealized DOS-applicable situations. The anticipated increase in DOS applications has every appearance of a being a discriminatory 'giveaway' program whose specific qualification criteria are currently quite unknown. iii. **Limited Use:** The 20% load factor constraint supports the concern that there will be a "potential increase in the number of applications" [Slide 46] One would anticipate the appearance of a new cottage industry focused on fabricating credible DOS applications, leading to widespread and embedded dependence on this discount. (And to the same problems now being experienced in weaning customers off of the 12CP discount…) Rather than providing customers with reassurance that DOS 'giveaways' will be 'effectively secreened' with 'regular audits', this constraint highlights the potential for DOS to become a 'giveaway' program to provide relief from Alberta's high transmission rates. There may be merit in providing discounted transmission rates to certain types of customers – but that is a policy and legislative question, not a rates matter.
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	Whether or not DOS brings any customer benefits is entirely dependant on the qualification, screening and audit processes. Until and unless those processes are clearly defined, customers not using DOS cannot have confidence that DOS will not devolve into back-room deals designed to placate major users, and customers using DOS do not know the case they have to meet. Much attention has been given to the back end AESO administrative processes like dispatch, and comparatively little attention appears to have been paid to the critical up-front qualification processes. Meaningful, detailed analysis of production costs and product revenues will be vigorously resisted by customers, as it would imply disclosure of highly confidential competitive data. Vague, 'qualitative' assessments that open the door to transmission revenue erosion will be vigorously opposed by customers paying the bills, and would doubtless be of concern to the Commission. Difficult as it is, this impasse needs to be addressed in consultation, not brushed over until litigation begins.

4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	It is not clear how DOS modernization meaningfully addresses the specific situation of storage providers. Storage should be dealt with as a separate issue.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	Increasing transmission system use will necessarily place upward pressure on the pool price, offsetting customer benefits from increased DOS revenue. An assessment of overall impacts would be most useful in assessing in what circumstances DOS is indeed of overall benefit to customers. The detailed specifics of the DOS qualification process need to be clearly set out so that both prospective applicants and customers paying the bills are aware of the requirements and their required rigor (or lack thereof…).
6.	Additional comments	The AESO's efforts to develop this most challenging tariff application are recognized and appreciated. Onward!

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021 through May 28, 2021	**Contact:**	Leonard Olien
Comments From:	Canadian Renewable Energy Association	**Phone:**	587-971-0049
Date:	2021/05/31	**Email**:	lolien@renewablesassociation.ca

Instructions:

2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 28, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was helpful. It would have been more helpful if the AESO had prepared several examples to help focus the discussion on key issues and to illustrate how the modernized DOS will interact with the proposed market rules for energy storage. The examples provided by the AESO on May 26 may have reduced some of the confusion for load customers, however, examples specific to energy storage are required.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	In general, CanREA is supportive of the AESO recommendation for a modernized DOS as it may reduce the barrier to participation that results from the current DTS treatment. As detailed below, further details need to be discussed before CanREA can give unqualified support to the proposal, but there is the potential for the modernized DOS framework to result in a workable tariff treatment that would apply to energy storage technologies.

DRAFT

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	1) Qualification: The removal of the yearly qualification is very helpful for the participation of energy storage through a modernized DOS tariff. Regarding the need to submit a business case for storage, based on the AESO's own analysis, storage is eligible because storage projects will not be built under a DTS contract. CanREA suggests that there should be a simple, standard business case for storage qualification 2) DTS: The AESO stated in the session that they expected an asset using DOS to also have a DTS contract. This expectation is contrary to the rule that, to qualify for DOS, the asset must have a business case that the opportunity would not be economic under DTS. DTS is universally uneconomic in the case of energy storage technology. If having a DTS contract is essential for settlement reasons, then the minimum required DTS contract size needs to be less than 0.1 MW. 3) Must bid requirement: While we understand the motivation for the must bid obligation, there is considerable uncertainty about how this would work in practice. For example: a. For a stand-alone storage facility that does not want to charge in a given hour, is a bid still required? b. Are bids required to be submitted at T-2? CanREAS requests that the AESO provide a examples of expected bid behaviour for an energy storage facility that is participating in the ancillary services markets. 4) Hybrid Assets: The AESO stated that for facilities with a DTS and DOS contract, energy withdrawn from the grid would count towards DTS first and DOS second. A hybrid installation may require DTS capacity for station service, however using the DTS volume for energy storage may be un-economic. CanREA recommends that market participants with a hybrid installation be allowed to choose between adding DOS capacity to the station service DTS capacity or have DOS service as a separate asset within the AESO system. 5) Annual Capacity Factor: While CanREA recognizes the motivation for including a capacity factor limit, we are concerned that 20% is too low, especially for longer duration energy storage technologies, and is based on analysis of historical data that does not represent how energy storage technologies will operate. Long duration energy storage technologies, with the ability to store several days' worth of energy or more, will be

DRAFT

		increasingly useful as the penetration of wind and solar generation increases. CanREA requests that the AESO re-assess the need and level of the proposed capacity factor including an analysis of potential behaviour of long duration energy storage technologies.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	Global energy storage investments are experiencing exponential growth. CanREA is concerned that the proceeding to approve the Bulk & Regional tariff application could take considerable time and would result in delays to potential investments in energy storage technologies, with negative implications to both system reliability and system costs. The AESO should consider strategies that will allow for earlier approval of the modernized DOS. For example, the AESO could consider a separate submission to the AUC for modernized DOS or could ask for expedited consideration and ruling on DOS.

DRAFT

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	The AESO indicated that DOS volumes are not used for transmission system planning purposes because DOS loads can be curtailed if needed to manage system stability. The naïve conclusion is that there should always be "room" on the system for a particular DOS resource with the risk for curtailment carried by the market participant. However, the AESO has indicated that an assessment of available transmission capacity will be undertaken for a DOS application. CanREA would like to understand how the assessment will be made and what considerations will be used. CanREA would also like to understand the interaction between ancillary services participation and the must bid requirement. For example, if a 1-hour battery is providing spinning reserve, and is dispatched for one half of the capacity in a given hour, how would the facility manage bid volumes so as to be able to charge in the next hour so that the full facility capacity will be available for the remainder of the day?
6.	Additional comments	On May 26, the AESO provided several useful examples. Further storage specific examples would be useful to illustrate: 1) How the must-bid requirement for DOS operates with both full-range and half-range market participation for energy storage assets 2) How the must-bid requirement for DOS operates for hybrid assets that utilize the variable block mechanism.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 31, 2021	**Contact:**	Matthew Davis
Comments From:	Capital Power			**Phone:**	403.540.6087
Date:	2021/05/28			**Email**:	mdavis@capitalpower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable but would have benefited greatly from additional examples as much of the session was spent addressing industry understanding of the proposal. While the AESO's publishing of some examples on May 26th provided additional details, it did not provide sufficient details on many aspects of the AESO's proposal and fails to fully alievate the various questions that were posed in the stakeholder session.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	At this time, Capital Power is supportive of the general direction the AESO is taking with DOS modernization but believes that several details will require substantial review and consideration. These include, but are not limited to: • The 20% load factor limitation appears limiting for longer duration energy storage applications and those that may have frequent charge / discharge cycele. The following table illustrate this.

Figure 1 – illustrative comparison of load factors for different storage configurations

		"Typical" Daily Cycling 4:1 energy to capacity	"More Frequent Cycling" Twice Daily Cycling 4:1 energy to capacity	"Longer Duration" Daily Cycling 6:1 energy to capacity
Capacity	*MW*	1	1	1
Energy	*MWh*	4	4	6
Efficiency	*%*	20%	20%	20%
Cycles per year	*#*	365	730	365
Charging Energy	*MWh*	1752	3504	2628
Load Factor	*%*	20%	40%	30%

Notes: charging energy = energy x (1+efficiency) x cycles per year; load factor = charging energy ÷ (capacity x 8760)

While it appears that the AESO has based this only on past behaviour, in this instance, this is highly unlikely to be result in a good predictor on how new asset classes and use cases may utilize a modernized DOS framework. Capital Power would suggest that the AESO evaluate how future DOS users may use the tariff prior to determining a specific limit. Further, Capital Power requires more information around how the AESO would evaluate a load factor measurement across a year while settlement is performed monthly.

- The AESO has yet to present details on how DOS applications will be assessed. For Capital Power to better understand the proposal, the AESO needs to clarify at what stage of the connection process DOS will be assessed. The AESO also needs to articulate what is required in the business case, how it plans on assessing them in a consistent manner, and what recourse is available in the event of a disagreement. To reduce red tape, Capital Power suggests that the AESO's test be simple and clearly codified.
- Capital Power is concerned with AESO statements made in the May 20th session that energy storage assets must take out a DTS contract as well as a DOS contract. For no other generator does the AESO require a certain level of fuel supply reliability. The AESO should clarify its intent around requiring energy storage assets to also have a DTS contract, when one of the reasons for being granted a DOS contract, is that operating under DTS is infeasible for the project.

	Questions	Stakeholder Comments
		• The AESO's proposal appears to support a "may-bid" requirement for DOS. While this is in-line with current load requirements, the AESO did not clearly articulate how this would effectively work. Further, the examples provided on May 26th appear to indicate that the AESO could expect DOS units to submit a bid and move MWs into the bid and get dispatched when they elect to take DOS. More carification on how the AESO intends DOS participants to bid and how related market rules such as restatements and load outage reporting would assist market participants in better understanding the proposal. • The AESO appears to indicate that DOS capacity would be given its own bid capacity and will be able to participate in the operating reserve markets. Capital Power would like to better understand how this will work if only a portion of the load that participates in the operating reserves markets qualifies for DOS. • Further, given the importance of this rate for energy storage, Capital Power suggests that the AESO clearly articulate how its ES market participation rules will align with rules around DOS. The use of DOS appears to tangentially align with the AESO's full-range market participation option, in that charging under DOS would require a bid, but a full explanation would be useful to fully assess. Overall, while the AESO has identified the DOS framework as one that could be used for opportunity service, significantly more detail on the mechanics of DOS modernization will be implemented in the market is required for it to be fully tested by stakeholders. This includes additional clarity on qualification processes, energy and operating reserve market participation rules, and compliance and settlement procesess .
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	Please see Capital Power's response to question #2.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	Capital Power appreciates the AESO's description of how it accounts for controllable loads in its transmission planning. While useful, it is important that the AESO further explore how these loads would participate in the market and what level of transmission service they require so that the AESO can better reflect these

	Questions	Stakeholder Comments
		in their planning studies. Based on the interest in leveraging DOS modernization by both energy storage, and other loads that can be curtailed there appears clear interest in more than just a single firm service level for transmission access. While the AESO has stated that it will not "be prioritizing" development of additional information of location and available transmission capacity for DOS, Capital Power believes that the AESO should, at a minimum, provide a plan on when it intends to do so as it would be inconsistent with a technology neutral approach to provide a renewable capacity availability assessement while not providing a similar type of assessment for energy storage and other interruptible loads.
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	Capital Power has appreciated that the AESO has published prospective rates for DOS and DTS. To fully understand the DOS proposal relative to export opportunity service (XOS), Capital Power requests that the AESO publish a prospective XOS rate as well.
6.	Additional comments	While Capital Power is supportive of the AESO's timeline extension request, it is concerned that the AESO's presentation of materials at session 6B will be insufficient to properly engage stakeholders on the DOS modernization before preparing and submitting an application in front of the Commission. Given the expected timelines that the AESO presented, Jan. 1, 2024, Capital Power would be supportive of the AESO treating DOS modernization through a separate application so that changes to DOS do not get delayed with other changes.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 31, 2021	**Contact:**	Raj Retnanandan

4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was helpful

2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	We estimate that the DOS rate of $13 per MWh would amount to about a 67%($39.6/MWh-13.0/MWh)/$39.6/MWh) discount relative to average transmission costs of about $39.6/MWh (calculated). The above noted discount may be higher for industrial customers to the extent their firm rates are lower than average. As long as the customer's cost of production (say $100) exceeds the DOS rate of $13 plus pool price, the customer would buy energy from the pool. Conversely, if the DOS rate ($13) plus pool price (say $90) exceeds the customer's cost of production the customer would self generate. The threshold point the customer would curtail DOS would be when pool price is at $87 ($100-$13), in this hypothetical example. Assume the customer has a billing capacity of 100MW. To the extent the customer needs standby energy, that requirement is presently covered under the existing billing capacity. Under this scenario the customer pays no incremental transmission charges, on a $/MWh basis, for use of standby energy. Therefore the threshold point the customer would curtail the use of system energy would be when pool price equals or exceeds cost of self generation. In this example the thresholdpoint would be $100. Assume that the customer opts for the proposed DOS and assume that the customer chooses to reduce the billing capacity by 20 MW (MW reduction corresponding to 20% load factor DOS energy) in order to serve its standby requirements. In effect the customer would have replaced its firm billing capacity associated with standby load, with the non firm DOS. The intent of DOS however, is to facilitate incremental use of system energy. Would the customer draw incremental energy from the system as a result of the DOS rate? The answer appears to be no. This is because the pool price threshold point now drops to $87 and the customer would stop drawing energy from the system when pool price reaches $87. Compare this with the situation with no DOS, where the pool price threshold point of the customer was $100.00. In summary, the proposed DOS while contributing to erosion of firm billing determinants is unlikely to result in incremental use of energy as contemplated. For the above reasons CCA does not support the proposed DOS.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	For a DOS rate to serve its intended purpose the customer must demonstrate that the DOS consumption is truly incremental and the short term transaction would not occur if not for the DOS rate. The AESO has not established suitable criteria that would help identify and screen incremental use as above. Unless such criteria are established and implemented, the proposed DOS would contribute to erosion of firm DTS billing determinants. Shifting billing capacity associated with standby use to opportunity use would be contrary to the principles of cost causation because the fixed connection costs that have been put in place in order to accommodate a level of standby use are not going to be recovered by the heavily discounted DOS rate.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	Please refer to 3

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	It would have been useful for the AESO to explicitly outline how a modernized DOS helps interruptible loads whose use of the transmission system under the AESO proposed tariff re-design is no longer economically viable.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	DUC is supportive of the concept of modernizing DOS; however, DUC has concerns with regards to the actual plan to do so. This modernization proposal may work for some energy storage (ES) facilities, but it does not work for price responsive load and does not work for co-generators. The AESO should set out what it is trying to achieve with this DOS proposal. Is this supposed to be a tariff solution for price responsive load and/or co-generators? Optimally, DOS should help optimize wires utilization in Alberta, and contribute to lowering the wires costs for Alberta consumers, regardless of the end use customer characteristics. Are there metrics to determine whether DOS is successful? It would be helpful to communicate this in advance.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	The AESO is excluding high load factor loads, presumably because they are concerned that the use of DOS will simply be about tariff avoidance. Opportunity service was described as: *"Available to customers who could clearly demonstrate that their use of the transmission system would not be economically viable at the rates otherwise applicable".* The AESO's proposed tariff re-design is effectively creating a class of industrial customers whose use of the transmission system is no longer economically viable. The AESO should acknowledge that they are creating this issue via their proposed tariff design, it is not being created by industrial customers trying to avoid their transmission cost commitments. The AESO's proposed 20% load factor limit is excluding the use of opportunity service by the very consumers who are now faced with an uneconomic transmission system. The DUC's main concern is that DOS continues to be unavailable for unplanned generation outages. Few cogenerators utilize DOS for planned outages due to the program's inflexibility. There may be opportunities for increased transmission tariff revenue that is currently foregone. Since the AESO is looking to optimize utilization of the existing transmission infrastructure, why would the AESO not study available transmission capacity and publish it? We need more load on the system. This is a good opportunity to acquire more load.

4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	Alberta has a transmission system that is over-built. In its Long-term Outlook (LTO) of 2014, the AESO forecasted an AIL demand of 15,033 MW in 2021. In 2019, the AESO forecasted an AIL demand of 12,414 MW in 2021. Historical AIL Peak demand to date is 11,729 MW. There is over 3,000 MW of difference between forecast and actual which could be used to accommodate DOS. If we assume the current Alberta transmission system is designed to accommodate at least 17,000 MW of AIL (AESO's 2014 LTO forecast of 2027 AIL), there is at least 5,000 MW of difference available - a substantial portion of which can be used for DOS. The AESO needs to consider how to both retain existing load and attract new load investment to Alberta, without the need for additional large transmission build. Proper implementation of DOS can be a method to achieve both retention and expansion of load. The AESO is partially responsible for the transmission overbuild; we would like the AESO to propose solutions to utilize the excess transmission capacity available, even in the short to medium term. The DOS eligibility rules in 2021 may need to be different from 2010 and 2030. In addition, The DUC is concerned with how this proposed rate will translate from the AESO tariff level through to the distribution tariffs. If it is not a direct translation, we will be sending different price signals to ES facilities, in particular, connected at different voltage levels. This will create an unlevel playing field and possibly perverse outcomes. Does the AESO have a plan on how to resolve this?

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	Please see comments above re: examples. Settlement between DTS and DOS is confusing. The dispatch tolerance introduces another level of complexity. Market participants will need better explanations. It would help to show settlement.
6.	Additional comments	DUC is concerned that the AESO has not studied the stress conditions with and without the price responsive load. In the absence the study of the with and without the PRL at times of system stress, how can the value of the DOC charges be adequately determined? What is the AESO's rationale of charging any load a loss factor? In the Alberta design, losses are paid by generation.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 28, 2021	**Contact:**	Justin Rangooni
Comments From:	Energy Storage Canada			**Phone:**	647-627-1815
Date:	2021/05/28			**Email**:	jrangooni@energystoragecanada.org

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 28, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Energy Storage Canada (ESC) found the Session 5B valuable. The AESO appropriately provided an overview of the DOS rate, the modernization recommendations, provided responses to stakeholder comments and further details on the modernization recommendations. The session could have been more helpful if the AESO had provided insight and commentary on how DOS modernization recommendations linked with broader Alberta electricity market decisions. For example, including DOS in the energy merit order has impacts and interactions with the Alberta market design.

2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	ESC is encouraged that the AESO is proposing an opportunity service type for energy storage resources. A core function of energy storage resources is to seek opportunities to increase the utilization of the electricity system. Practically this means that energy storage will consume from the transmission system during hours when load customers use the system the least. There are a number of issues and outstanding clarifications that must be addressed before ESC can support the DOS modernization recommendations. • During the 5B session the AESO stated an assumption that energy storage under the modernized DOS must retain a certain amount of capacity under DTS for charging "to ensure capacity is available to charge". Energy storage participating under an opportunity rate must be willing to accept the risk that the transmission system may not have capacity available to allow the energy storage resource to charge. If energy storage resources require capacity to be available to charge (i.e., firm transmission service), then that energy storage resources should request DTS service for that capacity. The modernized DOS service should not arbitrarily mandate energy storage to reserve DTS capacity under an opportunity rate design. In previous sessions the AESO stated that they expect energy storage resource auxiliary service and/or station service should be covered under DTS rate. ESC agrees with this approach since this station service load is consistent and required to operate the energy storage system. The cycling of energy storage resources is performed for market opportunities and the cycling would not occur without unconstrained transmission system access. • The AESO has stated a concern of DTS cannibalization from DOS if a maximum annual load factor is not used. This approach may be appropriate for end-use customers but is not appropriate for energy storage resources. Energy storage will not cannibalize DTS since a requirement for firm capacity through DTS is a significant barrier to market participation in Alberta. In other words, without changes to bulk & regional rate design it is unlikely that significant energy storage facilities will be developed. AESO should be encouraging participation of energy storage since any payment through a DOS modernization rate would provide cost reduction for other customers. • The AESO has recommended a business case assessment to determine if a new connection can fairly use the opportunity service. The AESO admits that the business case application is subjective and increases the uncertainty of acceptability. The business case application for energy storage resources will be very similar regardless of technology type or market conditions.

		Assessing the business case each energy storage resource application is a barrier for energy storage development and unneeded administrative requirement. The AESO should provide a direct application path for energy storage resources recognizing that energy storage participation will not change and therefore has a common business case. ESC does support the following components of the DOS modernization recommendations • Removal of the term limit for DOS rate which provides certainty to energy storage assets that could operate for 20+ years • The capability of energy storage resources to offer ancillary services under DOS rate • Retaining the technical assessment for connection; any resource connecting to the Alberta transmission system should be assessed to determine if there are any negative impacts on reliability or system stability.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	• The DOS modernization recommendations create a dispatchable DOS that would have market participants bid for their energy consumption under the DOS rate. ESC is not opposed to exploring participation of energy storage resources in the energy merit order as ESC recognizes the benefits to system operation for the AESO (e.g., full range participation). Participation in the energy merit order carries additional risks and costs for energy storage that does not appear to have been considered in the DOS modernization recommendations. • Further, there are many additional considerations with respect to including energy storage in the energy merit order that are beyond the bulk & regional tariff design. Inclusion in the energy merit order requires an immediate and prompt review and assessment of Alberta electricity market design by the AESO and stakeholders to determine how storage participation may influence market outcomes and objectives. • In many ways energy storage resources are similar to interties for import and export purposes. ESC is interested in exploring XOS rate participation with similar modernization updates as the DOS rate (i.e., indefinite term, energy merit order participation, technical assessment for connection, etc.). It is not clear to ESC if the XOS rate will increase similar to the DOS rate increase or whether there are other barriers for energy storage participation.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	• The preferred rate design proposed by the AESO shifts a significant amount of transmission system costs to load on an energy basis. This increase in energy basis should not apply to the opportunity rate. The opportunity rate does not get firm transmission and the system is not built for opportunity rate participants. The transmission costs that have been shifted to be functionalized on an energy basis should not be included in the DOS rate. The system is designed to allow the flow of in merit energy and not for the flow of opportunity rate energy. Only costs associated with the flow of DOS energy should be included and these are not transmission costs (other than losses and variable O&M) by definition.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	See above discussion points
6.	Additional comments	None at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 31, 2021	**Contact:**	Mark McGillivray
Comments From:	ENMAX Corporation			**Phone:**	
Date:	2021/05/31			**Email**:	MMcGillivray@enmax.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable to understand how the AESO envisions expanding the eligibility of DOS to include other resources such as energy storage. ENMAX appreciates the additional examples provided by the AESO to illustrate DOS load bidding into the energy market. We are currently reviewing the document in more detail and anticipate we will have further questions. One main question we have is how would DOS work for an under 5 MW energy storage project and what controls and visibility would the AESO require on smaller energy storage projects?
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	At this stage, it would be helpful to understand what other options the AESO has considered outside of the proposal to modernize DOS and the justification behind its preferred option. Is there analysis available to compare the costs and benefits between the AESO's proposal versus other options such as creating a non-firm interruptible rate over the long-term? Are there examples of options in other jurisdictions that the AESO considered and reasons why they should not be pursued? It does not appear that DOS was that well received or utilized in the past and while it could be modernized regardless, it may not be the best long-term solution for energy storage.
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	ENMAX is currently reviewing the "DOS bid examples document" which was recently posted on the AESO's website. If the AESO were to move forward with having DOS load bid into the energy market, more consultation would be needed to understand how the market rules would work and address any secondary impacts. Given the various ways in which energy storage can be configured, the recommendation may not necessarily work in all circumstances and could be overly burdensome for smaller energy storage projects and participants. ENMAX is concerned that the AESO may be unintentionally creating challenges for stand-alone energy storage applications.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	As noted in our previous bulk and regional comments to the AESO, the potential for changes to be made to the transmission policy and regulation could help facilitate proper rates for energy storage.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	See comments above.
6.	Additional comments	None.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 28, 2021	**Contact:**	Jordan Balaban
Comments From:	Greengate Power			**Phone:**	403-630-4581
Date:	[2021/15/28]			**Email**:	jordan@greengatepower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 28, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Greengate Power appreciates the AESO's continued attempts to address stakeholder concerns related to the DOS modernization, and specifically its proposed use as a tariff for energy storage charging purposes.

2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	Overall, Greengate is supportive of a modernized DOS tariff and many of the recommendations proposed by the AESO. It is our opinion that modernizing DOS is a significant improvement to the existing alternative of DTS as the only charging option for energy storage assets; however, we have some specific concerns with AESO's proposed DOS Tariff: 1. **DTS Contract Amount.** There was a discussion worth noting from the AESO's May 20th DOS session. It is understood and accepted that an energy storage facility will have a DTS contract for the auxiliary loads required to operate an asset, which is common practice for generating facilities interconnecting into the AIES. However, the AESO verbally stated that there is an expectation, or potentially a requirement, for energy storage assets to include a portion of the energy storage asset's charging volume under the asset's Rate DTS contract. Chapman Ventures raised a question and subsequent concern that an energy storage asset, that qualifies as eligible for the DOS rate, should not be mandated to incorporate a portion of the charging capabilities under Rate DTS. The decision to include a portion of the charging capabilities for an energy storage asset under Rate DTS is a commercial and operational decision; therefore, this decision should be left to the discretion of the project proponent. Greengate acknowledges and accepts that DOS is an opportunity service and does not secure firm load service, as would be achieved through Rate DTS. However, Greengate requests that an assessment is conducted during the SASR process that identifies the quantity of additional rate DTS load that could be added prior to impacting the Rate DOS capacity request. Greengate respectively requests that the AESO clarifies its position regarding this topic in writing. 2. **DOS Price and Recall Rate.** The AESO concluded that there are neither drivers for a reduction in the 7-Minute DOS Rate cost nor exploring a faster responding DOS product. We would like to see the AESO explore both of these items more fulsomely. Greengate is not supportive of assigning variable cost to the DOS rate, with the exception of the variable costs associated with the provision of ancillary services. Fixed sunk transmission costs should not be recovered from Rate

		DOS customers. Because investments in the transmission system are not, and will not be, driven by Rate DOS capacity, a significant portion of the AESO's proposed Rate DOS costs (approximately $10/MWh) should not be assigned through Rate DOS. With this in mind, it is Greengate's position that the cost for Rate DOS should solely contain the ancillary services cost of approximately $5/MWh. Greengate supports the following DOS modernization modifications presented by the AESO: 1. **Annual Term for DOS**. We agree with the AESO's proposed change to remove the annual term requirement for DOS. We also agree with AESO's rationale that introducing dispatchable DOS removes the need for DOS to have a limited term. We agree that in order to qualify for DOS a participant must actively manage their assets through the offer / bid process. It is worth noting that this requirement (and the removal of the take-or-pay requirement) would force an energy storage asset to abide by "Full Range Participation" requirements; therefore, this would negate the "Half Range Participation" alterative proposed as optional under the AESO's Energy Storage Market Participation framework. 2. **DOS Take-or-Pay Requirement**. We agree with the AESO's proposed change to replace the take-or-pay requirement with an energy market bid. It is worth noting that this requirement (and the removal of the annual term requirement) would force an energy storage asset to abide by "Full Range Participation" requirements; therefore, this would negate the "Half Range Participation" alterative proposed as an optional under the AESO's Energy Storage Market Participation framework. 3. **Ancillary Services Provision**. We agree with the AESO position that DOS load would not be excluded from providing ancillary services.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	1. **DTS Contract Amount**. Greengate requests that the AESO permits all energy storage charging capacity to be classified under Rate DOS, assuming that the asset meets the eligibility criteria to qualify for DOS. The amount of Rate DOS requested by the project proponent, for a Rate DOS eligible energy storage asset, should be left to the discretion of the project proponent. It is understood and accepted that an energy storage facility will have a DTS contract for the auxiliary loads required to operate an asset, which is common practice for generating facilities interconnecting into the AIES. 2. **DOS Eligibility – Business Case**. Greengate supports a rigorous business case and quantification to test and approve Rate DOS eligibility. We support that the AESO implements fulsome requirements driving a quantitative business case for Rate DOS. A purely qualitative "rubber stamp" approval does not reflect the importance of a careful assessment to ensure ensuring that DTS contract amounts are properly maintained and not circumvented via Rate DOS. We recognize that there will be effort required to develop suitable business case requirements; however, quantitative standards and processes are necessary to ensure that the rate is neither misused nor terminated. If a Business Case is to be required to qualify for DOS, it is requested that the business case criteria for an energy storage asset is evaluated once (to determine eligibility) and is not revisited over the operating life of the asset, unless there is a revision to the DOS application. We support administration of DOS applications through the SASR process and request further clarity on how the DOS applications will be studied in the SASR process.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	**Timeline to finalize and approve modernized DOS Tariff**. Greengate is concerned that the proceeding to approve the Bulk & Regional tariff application could take considerable time and would result in delays to potential investments in energy storage projects. The AESO should consider strategies that will allow for earlier approval of the modernized DOS. For example, the AESO could consider a separate submission to the AUC for modernized DOS or could ask for expedited consideration and ruling on DOS. For additional considerations, please see the responses provided to Question 2 and Question 3.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	Yes. **DTS Contract Amount**. As expressed in our responses to Question 2 and Question 3, Greengate requests clarification and rationale regarding the AESO's comment that a portion of an energy storage asset's charging capacity would be required to fall under Rate DTS. If the AESO still stands behind this comment, it would be essential to understand whether the AESO's position is that an energy storage asset "should" or "must" allocate a portion of the charging capacity to Rate DTS. If this is proposed to be a requirement, we request that the AESO specifies what portion of the charging capacity (as a MW value, percentage value, or other stipulated measurable quantity) would be required under Rate DTS. However, Greengate reiterates our position that determination of whether a portion of the charging capacity is to be applied under Rate DTS should be left to the discretion of the project proponent. **DOS Applications via SASR**. As per our response to Question 3, we request clarity regarding how DOS applications will be administered and studied though the SASR process.
6.	Additional comments	We appreciate the continued stakeholder engagement and opportunity to provide feedback to this important process.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021 through May 31, 2021	**Contact:**	Kurtis Glasier
Comments From:	Heartland Generation Ltd. (“Heartland Generation”)	**Phone:**	(587) 228-9617
Date:	[2021/05/31]	**Email**:	Kurtis.Glasier@heartlandgeneration.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The presentation on May 20, 2021 could have been improved by including the examples (published on March 26, 2021) during the presentation itself. The explanation of the DOS modernization recommendation was not complete during the session.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	Heartland Generation is supportive of the intent to include bids from loads in the energy market merit order, and as proposed this change does not seem to affect the actual functioning of those customers. Further, Heartland Generation supports the simplification of rate DOS to a single type, with the removal of differentiated types (1 hour, 7 minute, and term) and the take-or-pay requirement. The AESO's intent of publishing available transmission capacity on the grid will be helpful for future citing decisions for both loads and generation.
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	Heartland Generation is unsure if the DOS modernization proposal will address the need for a differentiated rate classes, as expressed by multiple parties during the consultation. Customers have asked for an "interruptible rate" or "opportunity service" which would allow for the purchase of a lower level of reliability than a firm DTS rate customer; this opportunity service would impose less future transmission costs on the system and commensurately have less transmission costs allocated to the rate class. This opportunity service would be mutually beneficial in ensuring that transmission planning only incorporates those requesting firm service (i.e., rate DTS), and customers rate classes would be tied directly to cost causation principles. Heartland Generation understood that DOS modernization would include discussion on the formation of a new rate definition. Re-defining rate DOS should be the focus of forthcoming stakeholder consultation efforts. The AESO should work with stakeholders to modernize rate DOS, such that it will allow customers greater choice in determining their level of service (specifically how energy storage and price responsive load customers can benefit from a different rate class from DTS).

	Questions	Stakeholder Comments
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	As proposed, the administrative changes to the DOS rate seem straightforward to implement. Given the desire for more changes to the DOS rate to allow for greater flexibility and customer choice, the AESO should explore how an overhauled rate class for interruptible service could be implemented.
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	Asides from those concerns identified elsewhere in this document, Heartland Generation does not have any additional clarifying questions regarding the proposed DOS modernization recommendation.

	Questions	Stakeholder Comments
6.	Additional comments	Heartland Generation takes issue with the current and proposed eligibility criteria for DOS rate. The AESO includes an "economic test" to evaluate the opportunity, whereby a project only qualifies for DOS rate treatment if the opportunity would be uneconomic under rate DTS. This is an inappropriate consideration for the AESO, as sole seller of electricity, to require free market participants to disclose information in order to assess the economics of their business or operations. The AESO should not require an economic evaluation for a load customer to qualify for a DOS rate (or by extension any other System Access Service rate). Once the services are defined, the individual customer is in the best situation to assess the feasibility of that service for themselves, including any applicable terms and conditions of that agreement. **The AESO should remove all consideration of an economic test or evaluation from qualification for rate DOS**. The current DOS rate also includes a limitation on the ability of DOS energy to replace the energy provided by an on-site self-supplying generating unit on an unplanned outage or derate. The AESO has not provided sufficient justification for this limitation. It appears arbitrary for the AESO to prevent the usage of DOS energy if the transmission capacity on the line is otherwise unconstrained and DOS energy is available. If there is no constraint or otherwise limiting system condition, the effect from the load consuming DOS energy is the same regardless of the reason for the generator outage (planned vs. unplanned). The availability of DOS energy should be one of the only restrictions on when a load customer has access to the service. The AESO needs to look at the opportunity service currently being offered and how introduction of an opportunity service with a lower level of reliability could benefit the tariff design. Alberta electricity customers represent a diversity of load needs and flexibility, which is not currently reflected in the tariff rates offered. In general, customers wanting a lower level of reliability should receive an associated decrease in rate as the customer does not require firm service to the same extent as a DTS customer; on the flip side, the AESO would be required to reflect this desire for a lower level of reliability in its transmission planning and real-time constraint management. Once the opportunity service has been clearly defined, each customer can assess the correct balance of services (between DOS and DTS) that it will purchase from the grid.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021 through May 28, 2021	**Contact:**	Vittoria Bellissimo
Comments From:	Industrial Power Consumers Association of Alberta (IPCAA)	**Phone:**	403 966 2700
Date:	2021/05/28	**Email**:	Vittoria.Bellissimo@IPCAA.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 28, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was somewhat useful; however, it is very clear that we are at the beginning of a DOS design, not anywhere close to resolving outstanding issues or gaining market participant understanding of the DOS design. Loads, in particular, are very confused about how the 20% load factor works as well as how DOS can be used and how settlement works between DOS and DTS. It would be useful for the AESO to explicitly outline how a modernized DOS helps interruptible loads whose use of the transmission system under the AESO proposed tariff re-design is no longer economically viable. The explanations provided during the webinar were confusing. It would have been useful to have several load-only examples during the webinar. IPCAA appreciates that the AESO posted examples after the webinar; however, reviewing them live with stakeholders would be beneficial. This would be a welcome addition to the June 24th stakeholder session.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	IPCAA is supportive of the concept of modernizing DOS; however, IPCAA has concerns with regards to the actual plan to do so. This modernization proposal may work for some energy storage (ES) facilities, but it does not work for price responsive load. The AESO should set out what it is trying to achieve with this DOS proposal. Is this supposed to be a tariff solution for price responsive load? Is this supposed to be a tariff solution for ES? What does success look like for this DOS design? Optimally, DOS should help optimize wires utilization in Alberta, and contribute to lowering the wires costs for Alberta consumers. Are there metrics to determine whether DOS is successful? It would be helpful to communicate this in advance.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	The AESO is excluding high load factor loads, presumably because they are concerned that the use of DOS will simply be about tariff avoidance. Opportunity service was described as: *"Available to customers who could clearly demonstrate that their use of the transmission system would not be economically viable at the rates otherwise applicable".* The AESO's proposed tariff re-design is effectively creating a class of industrial customers whose use of the transmission system is no longer economically viable. The AESO should acknowledge that they are creating this issue via their proposed tariff design, it is not being created by industrial customers trying to avoid their transmission cost commitments. The AESO's proposed 20% load factor limit is excluding the use of opportunity service by the very consumers who are now faced with an uneconomic transmission system. IPCAA's main concern is that the 20% load factor condition effectively renders price responsive loads ineligible for DOS. IPCAA understands that the 20% level is based on historical information. Using historical behaviour as a predictor for the future, when the DOS design is changing, is not a recipe for success. This is particularly true when historical usage of DOS has been minimal. In addition, the 20% load factor is an annual condition, whereas settlement is monthly. On the ES front, ES investment is based on arbitrage, i.e., the price it can charge at versus the price it can sell at. This is good for the market and for consumers. Has the AESO modelled how this DOS rate would work for ES and how the AESO's proposed dispatch to gain the DOS rate would provide the flexibility ES needs? How does this serve consumers and optimize the delivered price of electricity? Since the AESO is looking to optimize utilization of the existing transmission infrastructure, why would the AESO not study available transmission capacity and publish it? We need more load on the system. This is a good opportunity to acquire more load. The AESO's preferred DTS rate design is uneconomic for many of the sites currently targeted for mitigation. Can the AESO provide more information on how this DOS rate will be modified for these sites? Will the 20% load factor requirement be lifted? Also, the must bid requirement is overly burdensome for consumers. Have any alternative options been considered?

4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	Alberta has a transmission system that is over-built. In its Long-term Outlook (LTO) of 2014, the AESO forecasted an AIL demand of 15,033 MW in 2021. In 2019, the AESO forecasted an AIL demand of 12,414 MW in 2021. Historical AIL Peak demand to date is 11,729 MW. There is over 3,000 MW of difference between forecast and actual which could be used to accommodate DOS. If we assume the current Alberta transmission system is designed to accommodate at least 17,000 MW of AIL (AESO's 2014 LTO forecast of 2027 AIL), there is at least 5,000 MW of difference available - a substantial portion of which can be used for DOS. The AESO needs to consider how to both retain existing load and attract new load investment to Alberta, without the need for additional large transmission build. Proper implementation of DOS can be a method to achieve both retention and expansion of load. In addition, IPCAA is concerned with how this proposed rate will translate from the AESO tariff level through to the distribution tariffs. If it is not a direct translation, we will be sending different price signals to ES facilities, in particular, connected at different voltage levels. This will create an unlevel playing field and possibly perverse outcomes. Does the AESO have a plan on how to resolve this?

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	Settlement between DTS and DOS is confusing. The dispatch tolerance introduces another level of complexity. Please see comments above re: examples at the June 24th session.
6.	Additional comments	IPCAA is concerned that the AESO has not studied the stress conditions with and without the price responsive load. In the absence of the study both with and without the PRL at times of system stress, how can the value of the CP charge be adequately determined? What is the AESO's rationale of charging any load a loss factor? In the Alberta design, losses are paid by generation.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 31, 2021	**Contact:**	Robert Stewart
Comments From:	RMP Energy Storage Inc.			**Phone:**	587-920-4833

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	It was unclear what the AESO was doing for load customers vs. energy storage participation. Load and energy storage are different as the business of energy storage is to provide the electricity back onto the grid at a later date and generates all revenue from energy market participation.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	We are supportive of discussions around removing tariff barriers for energy storage participation in the energy market. The DOS modernization as proposed does address a key issue with the current DOS rate namely the term changing from one year to indefinite but adds additional complexity, uncertain and cost to the DOS user. Therefore, significant modifications to the AESO's proposed DOS modernization would be required for us to it.. The modernization did not state explicitly that energy storage would be viewed as an acceptable business case for the DOS rate. This should be clearly stated to remove uncertainty for all market participants. The additions that the AESO has proposed including adding a load factor limit and an energy market participation requirement lack supporting information. The load factor limit appears arbitrary and should not be applied as the DOS rate already allows for interruption when the system is stressed. Unwarranted DOS applications should be screened using the business case. The exact load factor recommended does not clearly align with the system constraints outlined nor the available transmission in the future. Finally, the modification to having DOS customers participate in the energy merit order has implications beyond the tariff in the energy market. We note that current DOS customers are not required to bid a price for determining curtailment. Curtailment is related to system constraints only. Why the change? While we are open to discussing this, particularly for energy storage participation, it should be under a curtailable opportunity rate under a similar tariff to generation as the assets system impact, dispatch performance and obligations are the same as generation.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	The changes in billing functionalization percentages means the DOS rate is expected to increase significantly. Our understanding on the justification for shifting transmission costs into the energy functionalization in the DTS tariff is based on allocating a portion of the transmission cost to the flow of in-merit energy. This cost is incurred from a transmission requirement to alleviate a transmission constraint caused by in-merit energy flow. We note that the system planning used to determine transmission constraints does not include DOS customers. We also note that DOS customers do not cause a system constraint, either demand or energy flow related, as they would be curtailed prior to a constraint occurring. Therefore, allocation of these transmission costs for in-merit energy flow are not justified for DOS customers. This suggests that the DOS customer should pay for AS, losses, administration as it is not adding any other costs to the system. This tariff should be similar to STS + AS + Losses. The AESO should consider changing the DOS recall to 5 minutes to align with system marginal price intervals. This would allow for greater flexibility for the operators and energy storage asset participation.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	If a non-firm load has a must offer must comply within the energy market and is curtailable when transmission is constrained, then it is providing the same service as a generator in ensuring the lowest cost energy to firm load customers. This is particularly important to consider with increasing levels of intermittent generation. For example, if demand with firm and non-firm load energized intersects the merit order at $90/MWh and this non-firm load bid $30/MWh into the merit order, then dispatching this load off reduces the price towards $30/MWh for all other customers. This is the same as a generator of the same size bidding in $30/MWh. Consequentially, this non-firm load that is being treated the same as a generator and providing the same service to load customers should pay for the same transmission service as a generator (plus losses and appropriate AS). If this non-firm load is charging an energy storage asset then there are additional consumer benefits from increased competition when there are no additional non-firm loads to dispatch off.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	
6.	Additional comments	If there is no room for accommodating the modifications to the DOS rate as per items above we would recommend an energy storage rate based on Administration costs + losses + AS which should be equivalent to STS + AS + Losses be submitted in this tariff application for suitability to be determined by the AUC.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments

1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	On May 20, 2021, the DOS 101 discussion was valuable in ensuring everyone had the necessary background information and context. There were a number of inconsistencies that created confusion. At the start of the presentation, AESO members mentioned that a motiviation for modernizating the DOS was to expand eligibility, "including energy storage". The purpose of including energy storage was not clearly stated. However, during the modernization discussion, AESO acknowledged that: • it was made clear in the market participation engagement that energy storage has difficulty in bidding into the Alberta market, and • The load factor was assessed based on historical use and no modeling was done for the different energy storage technologies and how their charging/discharging characteristics (short versus long duration storage) might be affected by the 20% limit. • DOS should only be used as an opportunity service so any load (i.e energy storage) should have a base DTS. • The AESO has historically confirmed that the current DTS/STS costs create a barrier for investors of energy storage and deployment of energy storage. The comments noted above, illustrate the inconsistences in what AESO is saying is the motivation for the DOS modernization and where the proposed modernization has landed. The AESO has also confirmed that they have not completed any cases for economic evaluation of Energy Storage to determine if the new DOS proposed removes the identified barriers. How does the proposed DOS reduce the barriers identified by the AESO? Could AESO complete economic evaluation to determine if the proposed DOS for energy storage will alleviate the problem for Energy Storage identified by the AESO? The AESO appears to be focused on updating DOS rather than addressing the barriers for Energy Storage. AESO tried to provide examples of how the new DOS modernization would work related to bidding into the market, these examples created more confusion so a follow up on the bidding process for load and how this compares/differs from generation offers is needed. Further guidance on the business case assessment is also needed as this was explained as being quite subjective. Also it is concerning that the Energy Storage

		owner would be required to provide the AESO with commercially sensitive information. In no other case is commercial strategy required to be provided to the AESO for their adjudication.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	No, as illustrated above, there is inconsistencies in what AESO is saying is the motivation for the DOS modernization and the proposed modernization. It is not clear if the proposed DOS modernization solves the issue it was intended to.
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	Yes, modelling of charging/discharging behaviors of different energy storage technologies for short and long duration should be completed to help inform the load factor percent and the economics of Energy Storage. If DOS is still intended to be only an opportunity service and not a solution to the current economic challenges that energy storage faces, then additional work on how energy storage can participate in the market is needed.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	As acknowledged by AESO, the DOS modernization only supports the connection of energy storage on the transmission system, so more work on the impact this modernization will have on distributed connected energy storage is needed. Energy storage can provide a multitude of benefits to Alberta, including supporting the integration of greater amounts of renewable energy into the electric grid, deferring the need for new fossil-fueled power plants and transmission and distribution infrastructure, and reducing dependence on fossil fuel generation to meet peak loads. The AESO's role is to lower barriers and and enhance the ability of transmission grid-connected energy storage in the Alberta market given the barriers AESO has identified. The AESO's role is to provide a less restrictive market for energy storage participation. The AESO needs to provide a clear path for energy storage participation. For regulated assets, the AESO should ensure greater certainty of cost recovery for investments in energy storage technologies by developing a valuation method to help monetize the benefits provided by energy storage.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	1. What is the AESO trying to achieve by modifying DOS? 2. How does the proposed DOS reduce the energy storage barriers identified by the AESO? 3. What is the proposed DOS design based on? How does it compare with other jurisdictions? 4. How competitive is the overall DTS/DOS/STS rate compared with other jurisdictions for Energy Storage? 5. How does the process of dispatching charge/discharge compare with other jurisdictions for Energy Storage? 6. Why does the AESO require commercially sensitive information? Can access to DOS be provided without this information? 7. How does DOS rate fit with Energy Storage used for transmission and distribution deferral? 8. Can Energy Storage be seen by the AESO as a supercapacitor? (i.e. equipment used in a substation?) 9. Why is load now part of the market requiring bidding? 10. Does the AESO see energy storage moving to distribution and behind the meter transmission connection as a result of this proposed DOS approach? What will the impact to overall DTS revenues be as a result? 11. Could AESO complete economic evaluation to determine if the proposed DOS will alleviate the problem for Energy Storage identified by the AESO?
6.	Additional comments	Energy Storage is not generation and is not load. The current approach is shoehorning Energy Storage into a rate structure that is not suited for it. A new and fresh approach is required. The AESO has indicated that Alberta Energy needs to direct the AESO to create a new approach and the AESO will not create a new approach until this direction is given. Given that changes to tariffs and regulation require multiple stakeholder engagement and consultation, it is recommended that this is done specifically for Energy Storage rather than in a unsystematic approach where changes to regulations are limited to legacy structures.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021 through May 31, 2021	**Contact:**	Horst Klinkenborg
Comments From:	Suncor Energy Marketing Inc	**Phone:**	(403) 819-7125
Date:	2021/05/31	**Email**:	horst.klinkenborg@suncor.com

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Suncor does not believe that the session was particularly valuable because in hindsight, participants and the AESO had different objectives and expectations for the session. See Q&A 6 for further details.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	Suncor is not supportive of the fundamental premise of the current DOS. While the AESO's proposed modernization recommendation would likely improve DOS, it does not address the fundamental concern with the current DOS. See Q&A 6 for further details.
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	Suncor believe that the fundamental premise of DOS should be revised. See Q&A 6 for further details.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	Suncor believe that the fundamental premise of DOS should be revised. See Q&A 6 for further details.
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	In hindsight, a lot of confusion in Session 5B arose from a mismatch in expectations and objectives between the AESO and participants. Suncor understands the AESO's proposal, but believes that the proposal does not address the concerns of market participants. See Q&A 6 for further details.

	Questions	Stakeholder Comments
6.	Additional comments	The ISO is the sole provider of system access service (SAS) on the transmission system, and must provide SAS in a manner that gives all electricity market participants wishing to exchange electric energy and ancillary services a reasonable opportunity to do so. Further, the ISO must develop a tariff setting out the rates for each class of SAS, and the terms and conditions that apply to each class of SAS. The AESO currently provides system access service (SAS) by dividing customers into various groups, with each customer falling exactly into one group. For each customer group as defined by the AESO, the AESO offers exactly one SAS class. Customers within each class have the choice to accept that level of service and the associated costs or to not receive SAS at all. For example, if a customer wants to import power into Alberta, the customer has to take IOS, if a customer wants to supply power from a generating unit, the customer has to take STS; in either case, the customer's only choice is to take it or leave it. At first glance it might look like demand customers fare slightly better by having a choice between DTS and DOS, however, there is actually no choice. A customer either can afford DTS or not and this is what drives the outcome, not the customer's choice. If the customer can afford DTS, the customer must take DTS, and if a customer can't afford DTS, the customer inherently can't take DTS but *may* qualify for DOS. Not only does DOS not provide an additional rate choice, fundamentally it is an inappropriately delineated customer class. The AESO should not be concerned with a customer's economics. That is outside of the AESO's mandate and the AESO is not qualified to do so. This has been previously brought up in the Mothball Outage Reporting Rule consultation – a customer's economics are solely that customer's concern. The customer knows its assets, knows the industries they are involved in and make their decisions accordingly. At no point is it appropriate for the AESO to request and for a customer to have to provide any kind of information on the economics of the customer's operation. In short, the current DOS customer class should not exist. This gets to the heart of the issue: customers want the AESO to provide them with actual options. They are not interested in paying the price for a service level they do not want. Instead they want a service level that better reflects their needs and that they believe could be provided at a lower cost. In the current discussion there are various customer groups (notably price responsive loads, storage operators and customers with self-supply) asking for additional options. (In the past, some suppliers also made the case for additional options.) These groups have a broad range of flexibility and quite diverse needs with regard to their system access service. What they have in common, is the belief that their needs can be met at a lower cost and that such options should be pursued in order for them to then be able to also pay a commensurate lower price. Whether a single option could be sufficiently flexible to satisfy all these customers isn't clear yet. However, at least a single actual option is what customers expected to discuss in Session 5B. In summary, the AESO needs to abandon the current premise of DOS as a class of SAS available only to customers that "pass" an utterly inappropriate economic test and then the AESO needs to develop at least one SAS option for demand customers that reflects a lower level of service, therefore incurs less costs, and accordingly has a lower associated rate.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 31, 2021	**Contact:**	Mark Thompson

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	TCE appreciates all opportunities for stakeholder consultation. The bid examples published after the stakeholder session on May 26, 2021 were helpful. Ideally these examples would have been provided before the session, which would have allowed for a discussion to allow stakeholders to ensure the examples were understood. Further bid examples, particularly with respect to hybrid battery facilities that may choose to charge from the grid, would be helpful.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	TCE continues to support the application of an opportunity service rate for charging energy storage facilities. The AESO's recommended DOS modernization rate comes fairly close to meeting this objective. More specifically, there are certain elements of the AESO's DOS modernization recommendation that TCE supports and others for which we have concerns. TCE supports the removal of the annual term for DOS as it would have created a barrier to entry for energy storage. TCE also supports the provision that an energy storage facility operating under Rate DOS would not be excluded from providing ancillary services. In this regard, we request that the AESO clarify whether the DOS rate would be charged during the time when an energy storage facility is dispatched to provide ancillary services.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	<u>DOS Eligibility – Business Case Assessment</u> TCE is concerned that the AESO is proposing to administer a business case assessment for all Rate DOS applicants. We expect this would include all energy storage facilities. While we understand and agree with the AESO's objective to find an appropriate balance to enable DOS while ensuring that Rate DOS does not cannibalize Rate DTS, we expect the business case justifying Rate DOS for all energy storage facilities to be virtually the same. The effect will create unnecessary red tape and a barrier to entry. The AESO's proposal is subjective and lacks transparency, which could lead to inconsistent and discriminatory outcomes. For these reasons, TCE recommends that Rate DOS acknowledge that the business case justifying the use of Rate DOS has been met for energy storage facilities. <u>Load Factor</u> The AESO has proposed that Rate DOS incorporate a maximum annual load factor of 20 per cent to replace the current temporary and short-term use requirements. Energy consumed over the 20 per cent maximum would be charged at the DOS Term rate. The AESO arrived at the 20 per cent threshold based on historical load assessments of Rate DOS customers. TCE recognizes the concern that Rate DOS may cannibalize Rate DTS revenues and that high load factors may be an indicator for inappropriate use of Rate DOS. TCE requests that the AESO clarify why this threshold is needed in addition to the business case assessment. To the extent that the AESO concludes that this threshold is necessary, TCE recommends that the AESO not rely too heavily on the historical load assessments of Rate DOS customers when setting the threshold as it may not apply reasonably to future Rate DOS customers such as energy storage facilites. Care should be taken to ensure the load factor threshold is not too stringent such that it may restrict legitimate energy storage activities. TCE recommends that the AESO implement a more lenient load factor restriction in the range of 25 to 30 per cent. TCE anticipates that a threshold in this range would still satisfy the original need for the threshold. <u>Dispatchable DOS / DOS Transaction Request / Take-or-Pay</u>

		The AESO recommends that Rate DOS require full-range participation in the energy market and that this will replace the current transaction request requirement and the take-or-pay provision. For some parties, such as those that already actively participate in the market, this tradeoff may be worthwhile. For others, including current Rate DOS ratepayers, this tradeoff may preclude their ability to utilize Rate DOS. For this reason, TCE recommends that the AESO provide dispatchable DOS as an option. This would also be consistent with the AESO's prior recommendation that full-range participation be optional. <u>Minimum DTS Capacity</u> During the stakeholder session, the AESO stated it would require a Rate DOS ratepayer to contract for a Rate DTS capacity that was in excess of the facilities station load to ensure that the facility could charge in the event its transmission access was recalled. TCE strongly encourages the AESO to remove this requirement for several reasons. First, this requirement is inconsistent with the business case assessment that has already demonstrated that Rate DTS does not work for this facility. Second, the level of Rate DTS service is a business decision that should be at the discretion of the ratepayer. If the transmission access for the customer is insufficient, it should be up to the customer to determine whether it needs more Rate DTS capacity. Third, this requirement is discriminatory. No other Rate STS customer is required to have firm transmission service for its fuel delivery, nor should it.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	Rate Export Opportunity Service (Rate XOS) is another opportunity service that warrants consideration for energy storage facilities. In some ways the charging of energy storage facilities is more similar to exports than the current loads under Rate DOS. This would include the timing of the load. Like exports, the charging of an energy storage facility is expected to occur when the system is not under stress. The same cannot be said for the current DOS load. TCE requests that the AESO explain why Rate XOS is not being considered as an alternative for energy storage facilities. TCE further requests that the AESO publish what Rate XOS would be under its preferred bulk and regional rate design. This is needed by stakeholders not only for comparison purposes with Rate DOS, but also for stakeholders that are Rate XOS ratepayers.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	At slide 54 of the presentation, the AESO stated that it would not be prioritizing the publication of the location and availability of transmission capacity for Dos as part of the DOS modernization. TCE recognizes that the AESO may not have the time to include this information within the timeframe permitted for DOS modernization. Nevertheless, the publication of this information could improve the efficiency of the transmission system and significantly reduce future costs. Would the AESO agree to include this in future consultations?
6.	Additional comments	TCE has no additional comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 28, 2021	**Contact:**	Luis Pando
Comments From:	TransAlta Corporation			**Phone:**	403-267-3627
Date:	2021/05/28			**Email**:	Luis_Pando@transalta.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 28, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	**A better (more comprehensive) set of examples would be helpful and more information is required to fully understand the AESO's proposal.** TransAlta considers the session was valuable, particularly the discussion of the history of the current DOS process and requirements. However, some of the examples used during the presentation were very simplistic and it was evident that more analysis is required.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	**TransAlta is supportive of DOS modernization but has concerns with some elements of the recommendation.** TransAlta considers the modernized framework that incorporates interruptibility is an important advancement in the tariff, particularly the treatment of energy storage technologies. However, we need to understand the details of the implementation of this proposal before we can fully support it.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	**The business case requirement for DOS is not necessary and should be removed.** TransAlta considers that the condition of interruptibility (and this risk) is enough for the DOS applicant to make the decision to choose between DOS versus DTS. We do not agree that the AESO should have a role in reviewing this business case under a modernized design and the AESO should endeavor to remove this unnecessary requirement under its existing, administratively burdensome, process. **TransAlta is concerned that the penalty for exceeding DTS and DOS contract capacity is introducing a ratchet of the DOS rate.** It seems the AESO has designed two penalties as the DOS customer that consumes above the rate is curtailable/interruptible, and then also incurs the same cost as a DTS customer. Charging the customer DTS and making the customer curtailable would make this rate design discriminatory. **The AESO should providing details about its rationale and calculation of the maximum load factor.** It is unclear how this historical assessment of low usage of DOS is relevant to the conclusion that a 20% maximum load factor should apply. The historical data does not reflect the current market conditions or broader application of DOS under its modernized design. We are concerned that there have not been a lot of historical users of DOS and, consequently, the data set is not representative. As such, we struggle with historical data being useful or reliable enough to determine a maximum load factor. For example, we do not think that a 20% maximum load level is indicative of the load factor for energy storage. Moreover, we question how using an maximum load factor calculated annually can be applied on DOS settlements which are calculated on a monthly basis. We simply do not have enough information to have any confidence in the AESO's proposed maximum load factor or fully understand how it will be applied.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	While we see potential benefits behind a dispatchable DOS and the idea of moving the operation of DOS from the tariff to the energy market rules, the recommendation adds extra requirements regarding bid submissions.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	The AESO stated that historically very few customers on DOS, which raises questions about the robustness of the dataset of DOS customers historically and how big is that sample size. In addition, TransAlta questions the relevance of the historical DOS load in a period of time when no energy storage providers were present. The AESO is recommending that a participant can only get the DOS rate if they bid. Clarity is required on the must bid requirement and whether it applies to all circumstances or only when the intent is to use DOS. Clarity is also required about the ability to restate the bid within T-2. TransAlta also questions why the AESO is concerned about a load customer dispatch compliance and why is it an issue if the customer doesn't consume their full DOS.
6.	Additional comments	TransAlta considers that more discussion is needed about DOS participation on the energy market, with better examples that assess the impact on different types of load, including treatment of different energy storage configurations.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	Turning Point Generation (TPG) appreciates the continued engagement opportunity provided by the AESO on this matter. We continue to believe this is a valuable process for all stakeholders.
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	TPG has been supportive of AESO's development to date of an opportunity-type service for energy storage resources. However, based upon the details provided in the latest Engagement Session 5B (DOS), TPG is not supportive of the AESO's current DOS modernization recommendation. The two most problematic issues with the recommendation from an energy storage perspective are a) the Annual Maximum Load Factor provision, and b) the Business Case eligibility test. In both cases, the AESO has not provided enough analysis to warrant their application and therefore these items appear to be arbitrary and subjective in nature.
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	The AESO should exclude the two concepts noted above, being a) the Annual Maximum Load Factor provision, and b) the Business Case eligibility test. TPG believes that these concepts combine arbitrary and subjective aspects which will result in added uncertainty. TPG suspects that this added uncertainty will render the DOS modernization impractical and therefore limit energy storage market participants use of this rate class. In TPG's view, these proposals do not support a "red tape reduction" strategy nor due they adhere to fundamental FEOC principles.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	Through the DOS modernization, the AESO is proposing that energy storage resources be included as full-range participation in the energy merit order. The AESO has previously engaged on the question of full-range participation with the energy storage stakeholders outside of this current Bulk & Regional Tariff engagement. There are many additional considerations with respect to including energy storage in the energy merit order that are beyond the Bulk & Regional tariff design. Inclusion in the energy merit order requires a review and assessment of Alberta electricity market design to determine how storage participation may influence market outcomes and objectives.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	None at this time.
6.	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021 through May 28, 2021	**Contact:**	Megan Gill
Comments From:	The Office of the Utilities Consumer Advocate	**Phone:**	
Date:	2021/05/28	**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 28, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was a valuable review of the original intent and purpose of DOS and considerations of the pros and cons of any changes to the structure and conditions of access to this opportunity service.

2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	While the UCA is generally supportive of the intent of the proposed changes to DOS and the cost benefits it could theoretically yield to residential, farm, and small business consumers, we remain concerned about the potential for revenue loss and future DTS rate increases. This DOS was initially designed to address the following key objectives: 1. To maintain a clear *distinction* between the *regulated* tariff for using the "wire' system based on *cost recovery*, and the separate price-offer based *market* arrangements for energy and ancillary services.This translates into paying for the use of a pre-agreed amount of wire capacity regardless of load factor or the economics of market based energy consumption or supply of other services. 2.To provide reliable safeguards against the cannibalization of DTS revenues by attracting *only* incremental (or avoided decremental) use that would not otherwise have occurred in the absence of DOS. Limited terms are an important part of these safeguards. 3.Comparison with extra-provincial exports and import procedures is not relevant as inter-provincial tie-line transactons are *inherently* market based opportunity transactions where DTS would never have been applicable in the first place. In UCA's view, any changes to DOS must be carefully considered so that the door to revenue loss is not opened any wider than necessary. In our opinion the modernization reccomendations result in an uneccessarily complex rate that fails to meet the crucial objectives of an opportunity service and obscures the potential for revenue losses. The modernization would increase the risk of revenue loss as: 1.Linking DOS to offers in the energy markets and achieved load factors bases the rate on energy market dynamics instead of regulated transmission costs and Bonbright pricing principles. This change introduces unnecessary complexity and obscures the clarity of DOS purpose, increasing the risks of revenue losses. 2.The proposed energy market linkage and the removal of limited terms weakens the protections built into the existing DOS to lower the risks of revenue losses through cannibalization of DTS and opens the door to future increases in DTS. 3.Comparisons with import and export trading arrangements on interconnectors, and the provision of ancillary services used to justify the linkage to the energy or ancillary service markets are invalid and confuse the purpose of DOS and the very different purpose and basis of tie-lines and import/export transactions.

		The UCA is supportive of the intent behind the combination of qualitative and quantitative measures to evaluate DOS eligibility while avoiding DTS cannibalization, which is hoped to be achieved through increased oversight that will come from annual technical and business case assessments.
3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	If the intent of DOS modernization is to encourage energy storage developments we would recommend the introduction of a separate rate or arrangement. That is specific to new energy storage installations only. If the use of DOS is limited to recognized energy storage developments the potential to cannibalize DTS revenues could be limited. It will be increasingly important to have sufficient AESO oversight and scrutiny of DOS eligibility requirements to ensure the opportunity rate is being used as intended.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	Did the AESO consider restricting the use of DOS to specifc new energy storage installations? How will the AESO ensure transparency of DOS utilization and potential impacts on revenue loss? What metrics will the AESO use to determine if the changes to DOS eligibility needs to be reassessed?
6.	Additional comments	NA

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 13, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS)

Period of Comment:	May 13, 2021	through	May 31, 2021	**Contact:**	Colette Chekerda
Comments From:	West Fraser Mills Ltd.			**Phone:**	780-920-9399
Date:	[2021/05/31]			**Email**:	Colette Chekerda

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **May 31, 2021**.

The AESO is seeking comments from Stakeholders on its DOS modernization recommendation. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	Please comment on Session 5B hosted on May 20, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful?	The session was valuable in that DOS required it's own session, however clearer examples and description of how the DOS is expected to work would have been helpful. **The consultation and feedback timelines are very tight for this process. We do not believe that we have been given adequate time to review and respond to the consulation and the materials that have been provided.** **West Fraser (WF) is a forestry company, and does not employ tariff design professionals. As such, we must defer at our own expense to subject matter experts in this process. Loads pay for all of the transmission in Alberta, yet do not qualify for cost recovery as part of tariff consultations and proceedings. WF is both exposed to the cost of the tariff re-design and the cost to defend our company against this cost increase. This process is not fair, efficient or economic in our opinion.**
2.	Are you supportive of the AESO's demand opportunity service (DOS) modernization recommendation? Why or why not?	WF supports the initiative of moderninzing DOS, however the AESO proposal for DOS apears unnecessarily complicated. The dispatch should be a "down to" DTS contract level – similar to what the capacity market envisioned for load resources. The basis for the 20% load factor appears arbitrary and restricts usage by highly impacted loads. To mitigate increasing costs of rate DTS, DOS volumes should be based on economic necessity. If the participant meets the eligibility criteria for DOS, then it would be in the best interest of other rate payers that the volume be maximized to provide incremental revenues. WF sees the DOS modernization in it's current form as not being a good fit for the load type that is most affected by the tariff modernization. Price responsive loads must respond to price signals to mitigate costs to remain competitive. If DOS volumes are combined with DTS volumes for price responsive loads, then the price signal relating to coincident metered demand is affected.

3.	Are there considerations that the AESO should include, exclude and/or modify in its DOS modernization recommendation? Please specify and include your rationale.	WF requires the following modifications to support the DOS tariff proposal: *1. Removal of the maximum load factor requirement* If the opportunity meets the eligibility criteria, and would be foregone revenue if the DOS is not granted, then it is in the best interest of ratepayers to maximize the use of DOS. *2. Eligibilty criteria should include a. a credible by-pass opportunity and b. should be extended to price responsive load.* First: If a load can demonstrate they would exit the grid in the absence of DOS, then DOS should be granted in this circumstance. This would keep more load on the grid, and delay grid defections, hopefully to the point where CTI projects have been depreciated and DTS costs become more attractive than a bypass option. Once a load makes the decision to defect from the grid, they are not coming back and their future revenue contribution is gone. Most loads do not want to be generators and are only doing so to remain competitive in Alberta. It appears as though loads are being held hostage to an overbuilt transmission system (self-supply and export restrictions, adjusted metering practice that would move existing net metered sites to gross metered sites with a SASR change, the proposed DTS tariff), these restricitons will only lead energy intensive loads to more extreme measures to remain competitive. This includes moving production to other more attractive juristictions or completely defecting from the grid. This result will be detrimental to Alberta ratepayers, the Alberta economy, jobs and future investment in the province. Second: Loads that demonstrate consistent CPD and energy market response should have that portion of their load eligible for DOS. This would result in several key benefits to all ratepayers. • Load retention and revenue enhancement: Energy intensive and trade exposed loads respond to price signals in order to remain competitive in Alberta. The proposed DTS tariff renders these loads uncompetitive. The mitigation solution needs to be a permanent rate option. An interruptible tariff is preferrable, however DOS could serve as a proxy with changes. Having qualified price responsive load granted DOS will keep these loads on the grid and continuing to contribute to the transmission revenue requirement. • Energy market stability: WF's price responsivle loads are aggressively responding to coincident peaks. This response is not confined to one 15

		minute interval, but happens many hours each month. This affects facility performance, energy efficiency and output but improves stability of the grid. Since the Alberta system peaks in the winter and summer, having flexible loads respond in the shoulder months reduces WFs productivity without a commensurate benefit in the transmission system. • Productivity improvement: Having price responsive loads operate under a DOS tariff instead of DTS will enhance productivity and economic output of WFs flexible loads. This may increase the revenue contributed compared to the current DTS tariff while keeping WF's facilties viable in Alberta. 3. Ensure that PODs are maintained despite having DOS loads. Consider a modification to DOS 7 minute where POD charges are separated out and billed according to the import requirement at the site (DTS + DOS MW). In exchange for this consideration, WF's operations would have assurance that our substations continue to be maintained and repaired when required. Further, a reasonable expectation of period of DOS availability (i.e. 5 year notice to exit or return to DTS). This will allow WF's high load factor facilities to continue to plan their business in Alberta with a reasonable period to pivot to on-site generation or move production out of province when the system no longer has opportunity capacity. 4. Allow a standing DOS bid in the energy market for 7 min DOS with a down to DTS contract level requirement under transmission constraints or EEA events. Sites paying for firm DTS service should not have to remove a block of energy to below this level. Energy market rules would need to be developed such that compliance is not an issue if the site load level was at or below the DTS contract level.
4.	Do you have any additional implementation considerations for the DOS modernization the AESO should consider?	The AESO DX-TX meeting of May 26, 2021 indicated that the AESO is intending on publishing transmission and substation capability maps to assist generators in deciding where to connect. This same work could be used for DOS customers to understand the capability in their area as well as a future outlook.

	Questions	Stakeholder Comments
5.	Do you have additional clarifying questions that need to be answered to support your understanding?	No further questions
6.	Additional comments	DOS could provide an opportunity for high load factor flexible loads to continue to remain competitive in Alberta, even with the very high cost of delivered power. The forestry industry plans to operate it's facilities for 40 – 80 years, so a DOS or interruptible rate is required with enough certainty to allow WF to plan for the future, mitigate delivered power costs and continue paying for Alberta's overbuilt transmission system is needed.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS) hosted on May 20, 2021

I. Purpose and objectives of the session

The purpose of this session is to engage stakeholders in a discussion of the AESO's demand opportunity service (DOS) modernization recommendation to allow expanded eligibility (e.g., energy storage).

The session objectives include:

- Present additional background on the AESO's demand opportunity service – what it is, the service it provides, and how it operates today
- Share our learnings on DOS modernization stakeholder feedback
- Present and discuss the AESO's DOS modernization recommendation for the purpose of seeking takeholder feedback on the recommendation

II. Session agenda

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose, and session objectives including extension requestion on engagement and filing schedule	AESO / Stack'd
8:15 – 9:00	DOS 101 – describes how the current DOS rate works today • Origins of DOS • How the current DOS rate is derived • How DOS works ○ How to apply for it, use it, curtail it, how is it charged and what happens if you misuse it • Q&A	AESO
9:00 – 9:20	Recap of AESO conclusions on non-firm rates • Q&A	AESO
9:20 – 9:35	Break	
9:35 – 9:45	Key highlights of AESO's DOS modernization recommendation • Opportunity rate design principles • Proposed key changes to DOS	AESO
9:45 – 10:05	What we heard • DOS rate under preferred rate design • Fast recall rate • Annual term for DOS • DOS take-or-pay requirement • Provision of ancillary services as a DOS customer • Availability of capacity	AESO

Public

Alberta Electric System Operator
Calgary Place, 2500, 330-5th Avenue SW Calgary, AB T2P 0L4
Phone: 403-539-2450 | Fax: 403-539-2949

IV. Overall outcomes from the day

The main objective of the session was for the AESO to present its recommendations for DOS modernization. Participants engaged in discussion and overall, stakeholders agreed that more clarity was needed to achieve a better understanding of the modernized DOS.

V. Session highlights

Captured below are the highlights of the questions and discussion on a topic-by-topic basis. For a detailed review of the session, please refer to the session recording, posted at www.aeso.ca.

Topic 1: DOS 101 – how the current DOS rate works today

i. Stakeholder Commentary

- Clarifying comments:
  - *Solas Energy:* Does the AESO use economic thresholds for any other connection load or generation?
  - *ERCO:* Could you provide the timing of the AESO's review of the DOS application? Days? Weeks?
  - *AltaSteel:* Does the AESO have any historic numbers of MW applied for and granted in the DOS?
  - *Best Consulting:* On Slide 27 (Current DOS usage request process), how are there only two reasons for denial listed when there is supposed to be an economic case?
  - *CanREA:* Are there other services where a lack of compliance can result in loss of access to the service?
  - *TransAlta:* If the AESO disqualifies a DOS customer as a consequence of an audit, is there a dispute resolution mechanism in place?

ii. AESO Clarification

- Response to clarifying comments:
  - DOS is the only rate that requires economic thresholds.

Public

- Regarding application review, the AESO takes 30 days from receipt of the application to approval.
- Regarding the historic numbers of MW of applied for DOS, these numbers can be found on Slide 90 (Historical DOS statistics) of the presentation.
- Regarding Slide 27, this slide is not about eligibility, it is about transaction requests.
- Regarding lack of compliance within other services, there are provisions within the ISO tariff that allow the AESO to terminate Demand Transmission Service (DTS).
- The AESO has a process for dispute resolution set out in the ISO rules.

Topic 2: Recap of AESO conclusions on non-firm rates

i. Stakeholder commentary

- Clarifying Questions:
  - *ADC:* Has the AESO studied the stress conditions with and without the response of the price responsive load?
  - *IPCAA:* Is the AESO forecasting load on the system or is the new issue forecasting generation on the system? In 2014 the AESO was forecasting for 2025, 16,318 MW of Alberta Internal Load (AIL) on the system, in 2019 it was forecasting 12,803 MW of AIL on the System, a decrease of over 3500 MW of AIL.
  - *Weyerhaeuser:* Can the AESO provide their information for load forecasting at an individual point-of-delivery (POD)?
  - *Alberta Newsprint:* After listening to the AESO, there's a stronger case for an interruptible rate. What I'm hearing is that the AESO did not build the system for the average load during stress conditions. Then, the argument is that some loads should not be paying the average transmission charges because the AESO did not build the system for the average load.
  - *Solas Energy:* Does the extreme conditions include 24x7 solar production at max. capacity and wind at max. from all facilities on an 8760 basis?
  - *ADC:* It seems like the AESO is aligned with the concept of coincident peak (CP); the concern is then the value. In the absence the study of the system with and without price responsive load at times of system stress, how can the value of the CP charge be adequately determined? There is some real value that happens in real time with the behaviour of particular loads. What would happen without these price responsive loads behaving as they do today?
  - *Suncor:* The AESO takes into account the diversity of load and does not stack DTS capacities, which implies that some customers add to the transmission system stress more than others independent of their contract capacity or total energy consumption. Coincidence/correlation among customers is clearly a system planning driver and should therefore be a cost driver and be appropriately reflected in rates.

Public

ii. AESO clarification

- Response to clarifying questions:
  - The AESO continues to forecast both load and generation. Looking forward, we are not going to be seeing load growing as much. The reinforcements to serve load are very small regional developments.
  - One aspect of DOS is that there is mirror-type behaviour and capability on the system – customers will want to use that capability at peak.
  - Regarding POD level forecasting, the AESO provides some high-level details of POD level forecasting when we release the long-term outlook. However, at the level of individual PODs, there is some commercially sensitive information – that is why the AESO has not historically released POD information.
  - The AESO creates study conditions for a range of planning activities to drive longer term plans. The AESO sees interruptible rates as being locationally driven. If an interruptible rate was provided in a specific region, it would be locationally specific where providing the rate would relieve the constraint. The specificity of an interruptible rate does not align with the postage stamp constraints that the AESO is trying to operate within.
  - In creating study conditions, the likely output of solar and wind are included. We have to identify what the right combination for solar and wind snapshot conditions are.
  - Under the current embedded cost allocation method and the one the AESO is recommending, there are a set of costs that have been deemed prudent to recover. It is a construct that is looking to align cost recovery with billing determinants and rates that get as close as possible to cost causation principles.

Topic 3: Key highlights of AESO's DOS modernization recommendation

i. Stakeholder commentary

- Clarifying comments:
  - *CanREA:* On Slide 16 (The origins of DOS circa 2001), can the AESO explain using "Cost Causation" to determine the rate when the original principle was that the rate should be based on value not costs?
  - *Power Advisory:* On Slide 51 (Annual term for DOS) – any customer using DOS rate would have to have a must bid requirement. But your proposal for market participation said you could choose either to bid or not.
  - *ADC:* I would like to understand the second last bullet on Slide 51. If your load is 29 MW, would your load not be compliant?

ii. AESO clarification

- Response to clarifying comments:
  - Regarding Slide 16, this slide references that DOS is supportive of cost causation principles. DOS does not cause costs and therefore having a rate that is based on value, aligns with cost causation principles.

Public

- Regarding Slide 51, the AESO's proposal for energy storage market participation said customers could choose either to bid or not. But we believe the best way to modernize the transaction portion of DOS is to have DOS moved into real time operations.
- Regarding the second last bullet on Slide 51, what the AESO was trying to highlight here is that if your load was at 20 MW, the settlement of DOS relies on metered volume. So, if your metered volume never got up to your DTS contract capacity, that energy would still be charged under DTS. When responding to a bid, the dispatch instruction is based on where your load is currently at and where you were dispatched from a compliance perspective.

Topic 4: AESO's DOS modernization recommendation

i. Stakeholder commentary

- Some participants were concerned with the AESO's use of historical data:
  - *Capital Power:* Has the AESO looked at different energy storage configurations? There's a bit of concern with always using historical behaviour to predict what future behaviour will look like.
  - *ADC:* Given the lack of historical use of DOS, how is the historical assessment of usage relevant?
  - *TransAlta:* What relevance does historical DOS load have if there weren't any energy storage providers under DOS in this historical period?
- Some participants were concerned with the perceived penalization within the AESO's modernized DOS recommendation:
  - *TransAlta:* It seems like the AESO has designed two penalties – the DOS customer that consumes above the rate is curtailable/interruptible and then also incurs the same cost as a DTS customer. If you charge the customer DTS, why would they be curtailable today (isn't this rate design discriminatory)?
  - *TransAlta:* Why is the AESO concerned about load customer dispatch compliance (why is it an issue if the customer doesn't consume their full DOS)? I'm not understanding the penalty on the customer's ability to get DOS in the future if they have already been ratcheted in the past.
  - *ADC:* With respect to meeting the dispatch requirements, this is problematic because if you're paying for DTS service for 20 MWs, you are offered 10 MWs and only use 5 MW, why would you have to dispatch below your DTS capacity? You shouldn't be required to interrupt below your firm level.
  - *ASCENT Energy:* Regarding the energy market versus DOS tariff charge – is it fair to say that one can only get the DOS rate (and avoid a DTS ratchet) if they bid (rather than give notice)? In the current DOS tariff, you have to give notice that you're planning to access your DOS – that's being replaced by the bidding process. If you fail to bid, you'll just run over your DTS limit, set a new ratchet and your bill will be bigger?
- Clarifying comments:

Public

- *TC Energy:* On the business case piece, what I worry about is the subjectivity associated with it. Two parties might submit business cases that are similar and one might end up being eligible for DOS and the other might not be. How does the AESO plan to address that?
- *TC Energy:* If a new revenue stream becomes available for a facility that bumps you above 20 per cent, they might now get pushed off DOS to DTS, which means you'll have to forego the new revenue stream. Can the AESO bump it up to 25 per cent to allow for more flexibility?
- *Best Consulting:* What would your bid be at various points on the graph on Slide 63 (DOS maximum load factor – Example)?
- *Capital Power:* Given the 20 per cent load factor is an annual measure, and settlement is monthly. How will this be performed? Will the AESO have to retroactively adjust its billings if load exceeds the 20 per cent?
- *Solas Energy:* Would you expect energy storage to use Supply Transmission Service (STS) and DOS or would DOS be used for charging and discharging?
- *Capital Power:* At what stage in the AESO's connection process would it assess a DOS request?
- *CCA:* Given that DOS capacity is not planned, what is the mechanism for recall in the event of transmission stress situations? I note that energy market dispatchability is purely an energy market issue and not a transmission one.
- *Solas Energy:* What is the AESO trying to achieve with DOS? What's the design based on (i.e., other jurisdictions)? Why do you need the application with commercially sensitive information? Are you bidding in the rate of change of charge or are you bidding in the absolute?
- *Chapman Ventures:* If there was a limitation on the system that wasn't just related to having firm capacity, there would be instance where STS wouldn't be available as well. All things equal, would that be a decision left to the project proponent?
- *ATCO:* Looking for clarification on the maximum annual DOS limit of 20 per cent. For a load contracted at 10 MW DTS, is the maximum annual 20 per cent load factor calculated as: (a) 10 MW x 20% x 8760 = 17,520 MWh or (b) 10 MW x 80% x 8760 x 0.2 = 14,016 MWh? Is the annual DOS limit applied monthly as the above number divided by 12?
- *Alberta Newsprint:* We're making it very cumbersome on the load – we'll end up with a similar issue that we have now that not a lot of people will take to DOS.
- *ADC:* The DOS tariff was presented as a potential opportunity for the most impacted customers. But now that the AESO has introduced the 20 per cent load requirement, it would put DOS out of eligibility for those customers. Where did the 20 per cent come from?
- *ADC:* Would there be any possibility just for the DOS to be a standard bid in the energy market? Could you just not have the 10 MW bid in and when you use it you use it?
- *Best Consulting:* As DOS is an opportunity service and transmission won't be built for it, what would you do if a firm load showed up and wanted to use the capacity and are willing to pay DTS for it?

Public

- *Lionstooth Energy:* From a quick scan of the AESO's project list, there are about 14 storage projects in the queue. Over half (~eight) of these appear to be connecting via the Distribution system. Has the AESO had discussions with distribution facility owners (DFOs) for how DOS concepts would flow through to the DFO tariffs? Is there a concern that there will continue to be different tariff signals sent between ISO and DFO tariffs?
- *DePal Consulting:* It sounds like a storage proponent might want to have a certain level of DTS because that protects them. If that's the case, that's really up to the project proponent on how much risk they want to take?
- *Suncor:* Concerned about a subgroup of industry discussing rate alternatives, as rates classes should principally be open to everyone. Further, if there is financial mitigation, it will have to be financed by other ratepayers, so those ratepayers should be allowed to be at the table. Asked the AESO to consider opening up for participation outside of the targeted mitigation customers?

ii. AESO clarification

- Response to comments regarding the perceived penalization for DOS users:
  - The AESO is not going to force customers to consume their dispatch level.
  - If a customer doesn't bid and runs over their DTS, then their bill would be bigger.
  - Regarding the perception of "double penalties", when a customer is dispatched to provide the DOS and if they exceeded their 20 per cent, there would be no impact to their contract capacity for DTS, but the AESO would charge that portion to the DTS rate. If the customer is consuming above the DTS contract capacity outside of the DOS, that is a different assessment covered by other provisions in the ISO tariff.
- Response to clarifying comments:
  - The business case was always there for DOS. The AESO understands it is a qualitative assessment with some subjectivity. The current DOS heavily relied on the business case. We think that by adding the load factor, goes a long way to assessing the overall application and there's less emphasis based on the business case.
  - DOS is not a rate for only energy storage.
  - For energy storage there are a wide range of energy storage implementations and the AESO would have to consider these in the assessment of the business case.
  - The current bidding rules would allow you to submit the bid whenever you choose to bid. If you weren't above your DTS line and you submitted a bid, you would still have to respond to the dispatch even though it's not technically your DOS load. Settlement and dispatch aren't closely coupled because it allows customers to control both load and bid.
  - Regarding time periods, the load factor was to be an annual load factor and the settlement done on a monthly basis. There would be an adjustment made to the monthly bill to calculate that on a go forward basis.
  - The expectation is that you have to demonstrate you can operate the asset without DOS energy, under DTS. If you didn't have DOS energy, how would you ever charge your asset.

Public

- DOS is using capacity that is deemed excess, that capacity is recallable. You could not operate a site without at least some capability to charge and we think there's a minimum that should be chargeable by DTS if DOS was unavailable.
- The minimum charge to DTS is part of our assessment to determine whether you're relying on DOS completely.

- Regarding transmission stress situations, even for energy market assets, there is the possibility for constraint and the AESO has the ability to constrain down assets. We would apply the same tools to DOS loads if a local constraint were to happen.
- There's a distinction between dispatching and settlement. The way dispatching works today is on a merit order. The controller is looking for a delta change between the time you were dispatched and the time when they expect you to change your load. That load may or may not be DOS load.
- Regarding the targeted mitigation engagement, the AESO will be asking what parts of this proposal work and don't work for mitigation.
- The 20 per cent load requirement is included in the proposal here so we can find the right balance between DOS and DTS in order to avoid DTS cannibalization.
- Regarding the how DOS concepts would flow through to the DFO tariffs, the AESO hasn't completely thought through all of that, but depending on the right metering and ability to respond by the energy storage distribution connected, don't see major issues right away. There is more work to be done by the AESO on this.

Date: Wednesday, May 12, 2021

Subject: **AESO Request for Extension of Filing Date for Bulk & Regional Tariff Application**

On May 12, 2021, the AESO filed a submission with the Alberta Utilities Commission ("Commission") requesting an extension of the filing date for the Bulk and Regional Tariff Application from June 30, 2021, as follows:

> The AESO must file its Application by October 15, 2021, or within eight weeks of the AESO's last stakeholder session, whichever is later.

An extension would permit the AESO to better address recent stakeholder feedback on the AESO's currently preferred tariff design through additional engagement with stakeholders on discrete areas of concern, such as the proposed energy charge, incentives for self-supply and the modernization of Demand Opportunity Service ("DOS"), and to provide a response to some of the issues raised by the Commission staff questions. Taking this time to share additional information and engage in additional dialogue will build mutual understanding of the AESO's preferred design and stakeholder concerns, and should narrow issues within the Application and associated proceeding. A broader shared understanding of the AESO's preferred design and the problems and challenges it addresses will help both the AESO and stakeholders to participate in a more focused and efficient way in the upcoming proceeding. An extension to the June 30 deadline will also allow the AESO to continue to work with the most impacted stakeholders toward a mutually agreeable mitigation solution.

Please direct any questions to tariffdesign@aeso.ca.

Agenda

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Session purpose and objectives

The purpose of this session is to engage stakeholders in a discussion of Session 5 stakeholder feedback or follow-up and key questions raised by the Alberta Utilities Commission (AUC) staff, and to provide additional clarity and build mutual understanding of the AESO's preferred rate design and stakeholder concerns. The session objectives include:

- Share our learnings on Session 5 stakeholder feedback or follow-up
- Present and seek stakeholder input on additional information on preferred rate design, including analysis of the potential response to the incentives provided in the rate design
- Present responses to key questions raised by AUC staff
- Seek to understand outstanding stakeholder concerns

Date: **Thursday, June 3, 2021**

Time: **8:00 a.m. – 1:00 p.m.**

Location: **Zoom Webinar**

Facilitator: **Stack'd**

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose and session objectives • Application filing extension request	AESO / Stack'd
8:15 – 8:45	Recap of preferred rate design and summary of stakeholder feedback received	AESO
8:45 – 9:15	Appropriateness of the flat energy charge • Time of use and dynamic pricing • On-peak versus off-peak charges • Mix/max load factor energy charges • Q&A	AESO / NERA
915 – 10:15	Cost recovery through avoidable charges and efficiency • Avoidable and non-avoidable charges • Efficiency • Q&A	AESO / NERA
10:15 – 10:45	Break	
10:45 – 11:45	Analysis of self-supply in response to the preferred rate design • Self-supply analysis • Q&A	AESO / NERA
11:45 – 12:45	Analysis of the short-term impact of the preferred rate design on the energy market • Energy charge • Coincident peak charge • Q&A	AESO
12:45 – 12:55	Session close-out and next steps	AESO

Notice

To: AESO Stakeholders

Date: Tuesday, May 25, 2021

Subject: **NERA Economic Consulting Report on Estimated Customer Response to Preferred Rate Design**

Further to the AESO's presentation of its Preferred Bulk and Regional Tariff Rate Design at its March 25, 2021 Stakeholder Session 5, the AESO received stakeholder feedback and certain questions from the Alberta Utilities Commission ("AUC") staff with respect to self-supply response to the Preferred Bulk and Regional Tariff Rate Design. In response to this feedback and the AUC questions, the AESO has posted a report prepared by NERA Economic Consulting entitled: Estimating Customer Response to Our Recommended Bulk and Regional Tariff Design (the "Customer Response Report"). The Customer Response Report will be discussed as part of the AESO's upcoming Bulk and Regional Tariff Design Stakeholder Session 6A on June 3, 2021, where stakeholders will have the opportunity to provide feedback on the report during that session and afterwards. The AESO is providing the Customer Response Report in advance of Stakeholder Session 6A to provide stakeholders additional time to review the document in advance of providing Session 6A materials on May 27, 2021. This is consistent with the AESO's Transparent and Timely Stakeholder Engagement Principle to assist stakeholders in understanding and evaluating the AESO's Preferred Bulk and Regional Tariff Rate Design.

Please direct any questions to tariffdesign@aeso.ca.

1. Executive Summary

1. NERA Economic Consulting ("NERA") has been asked to estimate the likely customer response and potential changes in self-supply outcomes by load arising from the Bulk and Regional tariff design that we recommended to the Alberta Electric System Operation ("AESO"), as described at the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5. In this report, we describe our analysis of the anticipated customer response to the change in transmission tariff.

1.1. Our recommended tariff should encourage more efficient self-supply decisions by customers

2. Customers can reduce their costs of electricity by choosing to self-supply and generate power at their own premises instead of purchasing power from the grid. A customer's decision to self-supply balances the benefit associated with not consuming power from the grid with the additional costs that the customer incurs to self-supply power. A customer's choice to self-supply may be efficient and lower the total costs of electricity provision if the avoided system costs of serving that customers' self-supplied load from the grid exceeded the costs incurred by the customer to self-supply over the long-run.

3. However, customers cannot know the costs that their demand imposes on the grid. They rely on regulated transmission and distribution tariffs and wholesale market prices to signal, to the extent possible, the costs incurred to supply them. Therefore, transmission charges which are cost-reflective will tend to encourage overall efficient self-supply decisions by customers.

1.2. Marginal cost approaches to transmission tariff design may not promote efficient self-supply decisions without locational pricing

4. In theory, a marginal cost approach to transmission tariff design should send an efficient price signal, that reflects the costs imposed by incremental changes in demand on the system, through a charge which varies with customers' consumption behaviour. The remaining costs should be recovered in a way that avoids distorting the consumption decisions that customers take in response to the marginal cost component of the tariff.

© NERA Economic Consulting

5. Changes in customers' demands have different impacts on transmission system costs, depending on where they are located. The AESO provides transmission capacity to move electricity from areas where the supply of in-merit energy exceeds demand, to areas where demand exceeds supply. Therefore, increasing demand in areas of surplus in-merit energy may reduce transmission costs (implying a negative marginal cost), while higher demand increases transmission costs in areas where demand exceeds supply (implying a positive marginal cost).

6. In developing our recommended Bulk and Regional tariff methodology, we have been asked to assume that rates do not differ based upon the location of load on the transmission system. In the absence of the ability to differentiate the marginal cost component of the tariff by location, a tariff that reflects the marginal cost of transmission would be unable to account for the fact that the marginal cost of accommodating demand in some areas is likely to be positive, while the marginal cost of accommodating demand in other areas may be zero or even negative.

7. Therefore, a marginal cost-based tariff that applies in all areas cannot reflect these differences and therefore cannot send efficient signals regarding the marginal transmission costs associated with accommodating changes in demand in Alberta.

1.3. An embedded cost approach encourages efficient, long-run self-supply decisions

8. By contrast, an embedded cost methodology seeks to signal to customers the long-run costs of providing transmission, in a way that identifies which costs have been incurred historically to accommodate (or have been caused by) particular patterns of usage, particular customers and/or particular services. By ensuring that the structure of tariffs (the balance between fixed, demand-related, and energy-related tariffs), reflects the cost structure of the transmission grid, the tariff can encourage efficiency in users' self-supply decisions.

9. In the AESO's case, it is currently charging for the majority of transmisison costs through a 12CP charge, to an extent that is not justified on grounds of cost causation as explained in the Stakeholder Session 5 presentation. The current tariff is therefore promoting inefficient self-supply decisions aiming to avoid 12CP charges. By

contrast, our recommended tariff better reflects the dual purposes of transmission in Alberta: to meet peak demand and accommodate the flow of in-merit energy.

10. However, even if the tariff is designed to reflect the cost structure of the transmission system, and therefore promote efficient decisions to use the grid or self-supply in the long-term, there remains a possibility that a tariff set to recover historical costs will cause customers to inefficiently self-supply in cases where those customers make lower contributions to historical costs. We therefore estimate customer response to our recommended tariff using a modelling procedure.

1.4. We estimate that customer response to our recommended tariff is likely to be extremely limited

11. In order to better assess how customers may respond to our recommended transmission tariff, we model the optimal self-supply decisions for industrial sites in Alberta. Our approach follows three steps:

    A. Step 1: We construct a model that estimates the optimal self-supply decisions for industrial sites across Alberta, based on a simple comparison of the costs of purchasing power from the grid and self-generation costs.

    B. Step 2: However, this optimisation model overstates the actual self-supply for customers because we do not model other costs associated with self-supply such as costs and risks associated with business complexity or financing. To estimate how customers' actual self-supply decisions will be affected by a change in the transmission tariff, we estimate a regression equation to capture how likely customers are to self-supply, given the economic incentive to self-supply identified in Step 1.

    C. Step 3: We then use our regression to predict customers' response to the change in incentive to self-supply under our recommended tariff.

12. We estimate that self-supply could increase under our recommended tariff by up to 2,801 GWh which is equivalent to a shift in costs from self-supplying customers to other customers of approximately 1.90 per cent of the total revenue requirement for bulk and regional costs in 2019. Our estimate of customer response is a total effect

that includes any dynamic responses[1] by customers to self-supply decisions of other customers.

13. Our estimate of customers' response is conservative because it ignores the potential for customers to increase purchases of power from the grid in response to lower 12CP charges in our recommended tariff relative to the current tariff.

14. Hence, we predict an extremely limited increase in self-supply by industrial customers under our recommended tariff, and any change in customers' self-supply decisions that does arise will tend to result in more efficient patterns of electricity usage than under the current methodology.

1.5. The economic case for self-supply is likely to significantly worsen in the next decade due to rising gas and carbon prices

15. While the impact of our recommended tariff on self-supply is likely to be limited given the current costs of self-supply, the economic case for self-supply in Alberta is likely to worsen in the next decade, even under a low energy consumption growth scenario. Both carbon and gas prices are forecast to rise over the next decade. For instance, we understand that the Federal Government has announced that, under its carbon tax regime, taxes will increase from $30 per tCO2 to $170 per tCO2 in 2030.

16. The impact of future growth in gas and carbon prices on incentives to self-supply depends on how the costs of self-supply change relative to the pool price. Higher carbon and gas prices will increase the pool price for power, as generators incur higher costs to produce power, thereby increasing the cost savings associated with self-supply. On the other hand, rising gas prices and carbon prices will also result in higher costs of self-supply using gas-based generation, decreasing the cost savings associated with self-supply relative to purchasing power from the grid.

17. Gas-based generation options available for self-supply are generally smaller and therefore less efficient (requiring more gas to produce one unit of electricity) than grid-level generation plants. Consequently, the costs of self-supplying power will

[1] By the term "dynamic response", we refer to our modelling procedure accounting for some customers' decisions to self-supply pushing up tariffs for other customers, leading them to self-supply too. Our reported results consider these knock-on effects of the initial change in the tariff to our recommended design.

increase more than the pool price in response to higher carbon and gas prices, because self-suppliers require more gas (and release more emissions) to generate one unit of electricity.

18. We estimate that rising carbon and gas costs will make self-supply technologies more expensive over time, when compared to the cost of purchasing power from the grid. For two representative self-supply technologies, we estimate that by 2030, the fuel and carbon costs of producing one MWh using self-supply plant will be $25.40 or $32.47 per MWh (in real 2019 terms) more expensive respectively than producing a MWh using grid technology, relative to around $10 per MWh today. Therefore, we expect that upward pressure on fuel and carbon prices is expected to further reduce the incentive to self-supply.

© NERA Economic Consulting

2. Introduction

19. We have been asked by the Alberta Electric System Operator ("AESO") to estimate the likely customer response and potential changes in self-supply outcomes by load arising from our recommended Bulk and Regional tariff design, described at Bulk and Regional Tariff Design Stakeholder Engagement Session 5. In this report, we describe our analysis of the anticipated customer response to the change in transmission tariff.

20. Our report is structured as follows:

    A. In Section 3, we discuss the factors that may influence a customers' decision to self-supply including the costs of self-supply options and the costs of purchasing power from the grid, and determine whether such decisions are efficient:

        i. In Section 3.1, we discuss the definition of efficient and inefficient self-supply decisions.

        ii. In Section 3.2, we discuss the ability of marginal and embedded cost tariff methodologies to promote efficient self-supply decisions in the Alberta context.

        iii. In Section 3.3, we provide a short discussion of current self-supply choices made by customers in Alberta under the current tariff.

        iv. In Section 3.4, we analyse the impact of our recommended tariff on the decision to self-supply. We provide the results of our modelling procedure developed to examine how changes in the AESO's tariff affect self-supply decisions by industrial customers. Overall, we find that any reduction in energy demand from the transmission system resulting from changing to our recommended tariff design is likely to be extremely limited, based on the current costs of self-supply.

        v. In Section 3.5, we examine how incentives to self-supply are likely to change in the future due to forecast changes in the economics of self-supply. We find that the economics of self-supply are set to worsen in the future, even under a low consumption growth scenario, because self-supply technologies are

impacted by rising carbon prices to a greater extent than grid level technologies.

B. In Section 4, we summarise our findings.

C. In Appendix A, we provide a detailed description of our modelling procedure used to estimate customer response, as reported in Section 3.4.

© NERA Economic Consulting

3. Customer Response to the Tariff

3.1. The Decision to Self-Supply

3.1.1. A customers' decision to self-supply

21. Customers can reduce their costs of electricity by choosing to self-supply and generate power at their own premises instead of purchasing power from the grid. A customer's decision to self-supply balances the benefit associated with not consuming power from the grid with the additional costs that the customer incurs to self-supply power.

22. Customers that choose to self-supply incur costs to do so. The costs of self-supply may include:

    A. The upfront **capital costs** associated with building or procuring a generator to use for self-supply, which would usually be depreciated and financed over the useful life of the generator;

    B. The **fixed annual operating and maintenance (O&M) costs** of generating power using the installed generator;

    C. The **variable costs** associated with generating power which may include the variable O&M costs of the generator, the costs of fuel for the generator, and the carbon costs associated with using fossil fuel generation; and

    D. **Other costs** associated with self-supply such as the costs of land for the generator, personnel, administrative costs, and costs associated with any additional complexity and risk to business operations relative to purchasing power from the grid.

23. The costs of self-supply may also be offset if an industrial customer uses a bi-product from generating its own power in its industrial processes. For instance, industrial customers that self-supply power using cogeneration technology may also benefit from using heat and/or steam in industrial processes.

24. A customer that chooses to self-supply also avoids the costs of purchasing that self-supplied power from the grid. A customer that chooses to consume power from the grid incurs multiple costs, that primarily consist of:[2]

    A. **Energy costs** associated with purchasing energy from the pool;

    B. **Transmission charges** as defined by the ISO tariff for use of the transmission system;

    C. **Distribution charges**, paid by distribution connected customers, for the use of the distribution system;

    D. **Local access fees** which are fees charged by municipal districts to customers in those service areas; and

    E. **Administrative charges**, for customers which purchase energy through an electricity retailer, associated with the billing and administration of the customer's account by the retailer.

25. The costs that customers avoid from self-supplying and incur from purchasing power from the grid depend on how and when they use electricity:

    A. Depending on their connection to the system, customers may not have to pay all of the above charges when consuming electricity from the grid.

        i. A transmission connected, industrial customer purchasing power from the grid would incur energy costs and transmission charges.

        ii. An industrial customer purchasing power from the grid but connected to a distribution system might incur energy costs, transmission charges, and distribution charges.

    B. Customers pay different amounts in energy, transmission, and distribution charges depending on when they purchase electricity from the grid. For instance, customers consuming at peak times will likely pay higher energy costs because the pool price tends to be higher and may also pay more in transmission charges if they consume during times of coincident peak. Other charges, such as a flat

[2] AESO (31 May 2020), Delivered Cost of Electricity Report, p. 15.

rate energy charge would be incurred irrespective of when customers consume from the grid.

C. Charges levied per customer do not vary depending on how much or when the customer consumes energy from the grid. Such charges are difficult to avoid through self-supply decisions, unless customers disconnect from the grid entirely.

D. Charges levied on billing capacity do not vary with customers' energy consumption across all hours, but do vary with customers' contracted capacity or peak energy consumption across the year. However, customers choosing to self-supply may reduce their contracted capacity as having generation on-site may reduce their reliance on the grid for peak requirements.

26. Therefore, customers incur different costs to self-supply and avoid different costs associated with purchasing power from the grid, depending on how and when they choose to self-supply.

27. A customer's decision to self-supply is not a binary decision. There are multiple different ways that a customer could self-supply that each result in a different net consumption profile from the grid. We distinguish four approaches and technologies that could be used to self-supply:

A. **Intermittent generation:** Customers could install intermittent generators to self-supply such as rooftop solar photovoltaic (PV) generators. The profile of such generation is not controllable by the customer and therefore the customer would still need to connect to the grid or install other forms of on-site generation that could run when the intermittent resource is not available. The customer would avoid paying some costs when it was generating, such as energy charges in the transmission tariff and the pool price. However, it would tend not to avoid peak charges, except to the extent that the generator happens by chance to be producing at peak time.

B. **Peaking generation:** Customers could install peaking generators characterized by low capital costs but high variable costs of generation. Customers can choose when to run peaking generation and would likely use it to reduce their consumption during peak periods, when they can avoid network charges linked to

coincident peak load, energy charges, and energy costs associated with higher pool prices. However, peaking generators will be less economic to run in off-peak periods meaning customers would likely remain connected to the grid and consume power from the grid during those times.

C. **Baseload generation:** Customers could install baseload generators, characterized by higher capital costs but lower variable costs of generation relative to peaking generators. Baseload generators will be economic in more hours than peaking generators, and could be used to self-supply in all hours throughout the year. However, customers deploying baseload technologies for self-supply would still need to be connected to the grid as they would be reliant on the grid for back-up in cases where their generator suffers a forced outage. Customers with baseload generation would avoid most energy costs and charges, apart from the occasions where it relied on the grid for back-up, and peak charges, unless it needed to use the grid for back-up during a peak period. However, customers would remain liable for any per customer, per connection, or contract capacity charges as they would remain connected to the grid. As we discuss above, customers may also utilise baseload generation to produce bi-products for use in industrial processes.

D. **Disconnection or grid defection:** Lastly, customers could completely disconnect from the grid, and rely entirely on their own power generation capacity. Customers that disconnect from the grid would avoid all energy costs, transmission charges, and distribution charges. However, they may incur higher costs to self-supply, as they would need to have technology in place to operate in an "islanded" mode of operation, without the ability to draw on the grid for support.

28. Customers can also avoid taking power from the grid at certain times to avoid charges, but without investing to self-supply. Management of load, by reducing or eliminating power consumption, can be used to avoid coincident peak charges which are levied on consumption during small time intervals throughout the year, or the purchase of energy at relatively high pool prices. However, customers would need to be able to predict when such time intervals occur. In management of their load at any

moment in time, customers face a trade-off between the opportunity cost of using power and the savings associated with avoiding the charges levied.

29. Customers may also invest in energy storage options to complement self-supply technologies or to help them manage their load and avoid periods of time associated with relatively higher costs of purchasing power from the grid.

30. Customers' decisions on how and whether to self-supply depend on their individual circumstances, namely how and when they consume power from the grid. A customer considering whether to self-supply could choose a combination of the approaches to self-supply (listed in Paragraph 27 above) to best meet its energy requirements.

31. In making self-supply decisions, a customer's load size is also an important determinant of the self-supply options available to it. The upfront capital costs of some self-supply options, e.g. baseload generators, often make them uneconomic for customers with smaller loads. Customers with smaller loads may be limited to smaller back-up/peaking plant, intermittent generation options, and load management. On the other hand, larger industrial and commercial customers are more likely to be able to pursue a wider range of self-supply options, including peaking and baseload generation or disconnection from the grid.

32. Customers are also constrained in their decisions to self-supply by other factors. Space and land availability may constrain the use of some self-supply options, such as the use of solar PV for larger industrial loads. Local emissions limits may also restrict the self-supply options available to customers. Lastly, industrials may face capital constraints in funding the upfront capital costs of self-supply options.

33. From the customers' perspective, optimal decisions to self-supply balance the costs incurred to generate their own power with the avoided costs of purchasing power from the grid. We would expect customers to take a holistic decision of whether to self-supply based on all the benefits and avoided costs of purchasing power from the grid (i.e. not just the transmission tariff).

    A. If the customer incurs fewer costs to self-supply than it would to purchase power from the grid (accounting for any associated benefits of self-supply, such as heat supply), then the customer would optimally choose to self-supply.

B. If the customer incurs more costs to self-supply than it would to purchase power from the grid (even after accounting for associated benefits of self-supply), then the customer would optimally choose not to self-supply.

34. Given that self-generation decisions typically involve investment in long-lived generation assets, we would expect a customer's decision on whether to self-supply to consider a forward-looking assessment of the costs of self-supply relative to the avoided costs of consuming from the grid.

3.1.2. Efficient and inefficient self-supply decisions

35. Economics defines a concept named "productive efficiency".[3] A market is productively efficient when it meets the demand from customers at lowest possible cost. The power market would achieve productive efficiency if customers' loads are met at lowest possible system costs, irrespective of which parties incur those costs.

36. It is not necessarily inefficient for the system if customers choose to self-supply. In fact, a customer's choice to self-supply may be efficient and lower the total costs of electricity provision:

A. A customer choosing to self-supply would improve productive efficiency if the avoided system costs of serving that customers' self-supplied load from the grid exceeded the costs incurred by the customer to self-supply over the long-run (net of any other costs and benefits from doing so, such as the value of heat); whereas

B. A customer choosing to self-supply would reduce productive efficiency if the avoided system costs of serving that customers' self-supplied load from the grid are less than the customer's incurred costs to self-supply over the long-run (net of any other costs and benefits from doing so, such as the value of heat).

37. Customers cannot know the costs that their load imposes on the grid. They rely on regulated transmission and distribution tariffs and wholesale market prices to signal, to the extent possible, the costs incurred to supply them. Therefore, transmission

[3] See for instance, Michael. J. Farrell (1957), The Measurement of Productive Efficiency, Vol. 120, No. 3, p. 253-290.

charges which are cost-reflective will tend to encourage overall efficient self-supply decisions by customers.

38. Following a change in the transmission tariff, customers may make different, and *more efficient*, self-supply decisions in response to a transmission tariff that itself better reflects the costs of transmission incurred to serve that customer's load. For instance, compared to the current tariff, our recommended tariff reduces costs recovered through a charge on 12CP in order to better meet principles of cost causation. Consequently, customers are more incentivised to consume power from the grid during times of coincident peak, thereby reducing inefficient self-supply decisions relative to the current tariff.

39. In its Distribution System Inquiry, the Alberta Utilities Commission (AUC) distinguishes customers' decisions to self-supply by whether they constitute "economic" or "uneconomic bypass" from the grid.[4] The AUC defines uneconomic bypass:[5]

> *"uneconomic bypass describes a situation where a customer's bypass decision (i.e., supplying its needs through other means) shifts fixed cost recovery, whether in whole or in part, to other customers. This occurs when a customer's decision to self-supply electricity does not change (or even increases) system costs, but results in that customer paying a smaller share of the fixed costs. This unrecovered fixed cost must then be collected from other customers"*

40. The AUC defines "economic bypass":[6]

> *"In contrast, economic bypass occurs when a customer supplying its needs through other means results in reduced costs for other customers. This happens when a customer's decision to self-supply electricity lowers system costs; so it is not only the self-supplying customer who is paying less for the system costs, but the costs for other customers are also reduced"*

4 AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 97 and 98.

5 AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 97.

6 AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 98.

41. As we discuss above, our recommended tariff seeks to more accurately signal the long-run costs of providing transmission in Alberta. Self-supply decisions in response to cost reflective tariffs promote efficiency in the overall supply of electricity, and will tend to reduce the costs faced by the customers who purchase energy from the grid. Changes to customers' self-supply decisions in response to our recommended tariff should therefore tend to be more efficient than under the current tariff, resulting in incentives that will encourage what the AUC terms economic bypass (and discourage uneconomic bypass) in the long-run than the current tariff design.

42. However, even though our recommended tariff seeks to better reflect the cost structure of the transmission system than the existing tariff in order to promote efficient decision-making on customers' usage of the grid or self-supply decisions, there remains a risk of inefficient self-supply decisions. Specifically, any tariff has to recover the current operating and historically incurred capital costs of the transmission system in Alberta. If the costs incurred historically are higher than the costs that would be associated with the costs of meeting customers' demands for electricity in the future, then there is a risk that any tariff set to recover historical costs will cause customers to self-supply.

43. In other words, customers that respond to the price signals sent by the recommended tariff design might make lower contributions to historical costs, thereby shifting recovery of those costs to other customers. As explained below, marginal cost pricing provides a potential solution to this challenge that has been discussed in the context of distribution tariff reform in Alberta.

3.2. Marginal Cost Tariffs as a Possible Means of Promoting Efficient Self-Supply Decisions

3.2.1. Theory suggests marginal cost tariffs promote efficient self-supply decisions

44. Economic theory, and the practical application of rate design in North America and elsewhere, sometimes uses a "marginal cost approach" as a potential solution to this problem of historical costs exceeding the forward-looking costs associated with future changes in demand for electricity. The marginal cost approach sets tariffs based on an

estimate of how a change in demand from a customer will affect the future costs of the utility.[7]

45. A theoretical advantage of a marginal cost approach is the ability to send an efficient price signal that reflects the costs imposed by incremental changes in demand on the system. This price signal should be sent through a charge which is "avoidable" or varies with customers' consumption behaviour. In theory, these prices promote efficiency by allowing customers to trade-off the benefits they derive from consuming electricity drawn from the transmission system, which may include the value derived from consumption or the costs of alternative self-generation options, against the transmission costs their consumption creates (as well as other costs such as the wholesale market price).

46. The concept of marginal cost-based pricing is discussed in the context of distribution network rate design in the AUC's Distribution System Inquiry:[8]

> *"distribution rates should contain a variable component to provide a forward-looking price signal to customers to manage their use of distribution system services that will affect the future costs of the network. This forward-looking component is based on variable charges (volumetric charges or avoidable demand, such as CP charges)"*

47. However, setting prices equal to an estimate of marginal cost will not usually (except by coincidence) generate enough revenue to recover the revenue requirement.[9] The difference between the revenue earned under marginal cost prices and the revenue requirement is often called the "residual" costs.

48. Consequently, in order to recover the revenue requirement efficiently, the marginal cost methodology prescribes that the residual should be recovered in a way that avoids distorting the consumption decisions that customers would take in response to the

---

7 National Association of Regulatory Utility Commissioners (NARUC), Electric Utility Cost Allocation Manual, January 1992, pp. 12-14.

8 AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 311.

9 NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 147.

efficient price signals conveyed by marginal cost component of the tariff alone. As explained in the AUC's Distribution System Inquiry:[10]

"Whenever an attempt is made to recover embedded or sunk costs (also referred to as "residual costs" in the quote above) through charges that customers can avoid (such as volumetric charges or CP demand charges), improper incentives (i.e., incentives contrary to the public interest in the least cost provisioning of electricity) arise to invest in self-supply, resulting in (i) under-recovery of fixed system costs; (ii) cost shifting to other customers; and (iii) uneconomic bypass"

49. In light of the above, methods to recover residual costs in a marginal cost-based tariff include:

A. Ramsey pricing, which recovers residual costs based on the relative elasticities of demand for different classes of customers.[11] Those classes with the highest price sensitivity will be charged the price closest to marginal cost (hence recovering less residual cost) while those that are least likely to respond to price will be charged the price that deviates the most from marginal costs (reflecting more residual costs).[12]

B. However, recognising that it can be challenging to identify the price elasticity of demand for all customers, the tariff could recover residual costs based on a charge levied on a billing determinant which is least likely to distort customer behaviour (and the price signal sent by the marginal cost component of the charge).[13]

C. Another method to recoup residual costs is to apply a proportional mark-up to the marginal-cost component of the charge.[14] While this approach is simple to administer, and can result in a similar outcome to Ramsey pricing if customer classes that impose the highest marginal costs also have the least price elastic

[10] AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 310.

[11] The elasticity of demand describes the extent to which customers can and are willing to change their behavior to avoid the charge. A higher elasticity of demand refers to a customer that is more willing to change their behavior to avoid the charge.

[12] NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 155-160.

[13] NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 162.

[14] NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 160-162.

demand, this methodology distorts the marginal cost price signal, and so undermines the efficiency properties of marginal cost pricing.

50. The choice of methodology to recover residual costs should also consider the equity of the tariff design.[15] For instance, levying a fixed charge per customer may disproportionately impact smaller customers relative to larger ones.

3.2.2. Challenges of applying a marginal cost approach to set the AESO's tariff

51. While the marginal cost approach is theoretically appealing as a means of encouraging efficient self-supply decisions, the current legislative framework in Alberta significantly limits the potential benefits of using a marginal cost approach in the AESO's tariff.

52. The efficiency of a marginal cost approach to set a regulated utility tariff that will apply to a wide set of customers (e.g. across a whole "class" of ratepayers) relies on the assumption that all such customers' consumption decisions would have a similar impact on the utility's costs. For instance, in a distribution system, it is reasonable to assume that changes in customers' consumption decisions (or growth in the number of customers) will have a similar effect on the distribution utility's costs because the majority of residential electricity customers have similar sized connections and are served with similar types of infrastructure.

53. In a transmission system, by contrast, it is not safe to assume that changes in all customers' demands have the same impact on the transmission system's costs:

A. New demand connecting to the system in a location that is close to new generation may help the AESO to avoid the need to reinforce the transmission system to evacuate power from the new generation facility. As such, the marginal cost of accommodating this particular change in demand would be negative.

B. On the other hand, additional energy consumption in locations near generators due for retirement, or in locations where demand is already high relative to the

[15] NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 164-165.

generation located nearby, may increase transmission costs. The marginal cost of accommodating such changes in demand would be positive.

54. In practice, the investments that the AESO identifies in the 2020 Long Term Plan (LTP) suggest that changes in customers' consumption decisions (e.g. demand, energy) in different locations of the network could be associated with different amounts of avoidable costs. For instance, while the AESO is currently only planning a single investment in the Northeast planning region to support voltage, it is planning multiple new single-circuit lines to alleviate *load* thermal constraints in the Northwest, two new bulk line circuits in the Central planning region to alleviate *generation* thermal constraints, and a new regional line in the Calgary planning region to alleviate *load* thermal and voltage constraints. Hence, changes in customers' consumption decisions in Calgary are unlikely to drive the same change in transmission costs associated with the identified investments in the Northwest as changes in customers' consumption decisions in the Northwest.

55. In developing our recommended Bulk and Regional tariff methodology, we have been asked to assume that rates cannot differ based upon the location of load on the transmission system. In absence of the ability to differentiate the marginal cost component of the tariff by location, a tariff that reflects the marginal cost of transmission would be unable to account for the fact that the marginal cost of accommodating demand in some areas is likely to be positive, while the marginal cost of accommodating in other areas may be zero or even negative.

56. Therefore, the marginal cost component of the tariff would inevitably differ from the marginal cost of transmission investment associated with accommodating an additional unit of demand at that particular location of the network. As such, a tariff set using a marginal cost approach would not necessarily lead to an efficient outcome.

57. To take a practical example, the electricity transmission pricing methodology in Great Britain sets tariffs that seek to approximate the long-run marginal cost of transmission, such that transmission users receive a forward-looking signal regarding the costs they impose on the grid. However, the primary purpose of these forward-looking signals is to send locational signals regarding the long-run investment cost

users impose on the grid in different *locations*, with charges for demand customers varying from £20.38 to £61.68 ($35.33 to $106.91) per kW per year, depending on location.[16] Customers also pay a non-locational charge per kW to cover residual costs.

58. Hence, even if marginal cost-based distribution tariffs may have the potential to encourage the efficient use of distribution systems in Alberta, the legislative framework in Alberta limits the potential benefits of a marginal cost methodology to set *transmission* tariffs. The relative importance of locational signals at the transmission system level compared to the distribution system level is recognised in the Distribution System Inquiry:[17]

> *"experts indicated that while there may be merits of locational pricing on the transmission system, there probably is much less value in locational pricing on the distribution systems, at this time"*

59. Whilst we assess that the use of a marginal cost-based approach for transmission pricing in Alberta is principally limited by the inability to vary the marginal cost component of the tariff by location, using such a methodology to set transmission tariffs would also entail challenges associated with the recovery of the remaining residual costs:

    A. The large increase in transmission investment seen since 2014 has not been accompanied by significant growth in coincident peak demand.[18] Over this historical period, load growth has also been relatively low. Consequently, we would expect a tariff based on a marginal cost approach to have a small marginal cost component and large residual cost component. Large residual cost components of the tariff create challenges for the recovery of those costs, whilst

[16] Half-hourly demand tariff reported for zones in Northern Scotland and South Western in Transmission Network Use of System Tariffs in 2021-22. See: National Grid (January 2021), Final TNUoS Tariffs 2021-22, Table 9. Currency converted using current exchange rate of GBP 1: 1.73 CAD.

[17] AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 317.

preserving the efficient price signal sent by the marginal cost component of the tariff.

60. As we explain above, under a Ramsey pricing approach, residual costs could be recovered from customers in proportion to their estimated price elasticities of demand (higher charges levied on customers with lower price elasticities of demand). However, estimating the price elasticity of demand for different customer groups is difficult in practice. Moreover, it involves levying costs on customer classes based on their willingness and/or ability to respond to charges. This approach would not seek to follow principles of cost causation but instead target the minimal customer response to the residual component of the tariff. The approach may also raise equity concerns.

61. Hence, a more practical implementation might be to levy the residual costs on billing determinants that are less likely to produce a response from the customer. For instance, the Distribution System Inquiry states that residual costs should be recovered from billing determinants that are non-avoidable, or difficult to avoid, such as fixed monthly charges or "non-bypassable demand charges" such as non-coincidental peak demand or contract capacity charges.[19]

62. However, unlike distribution systems, a relatively small number of customers are connected to the transmission system, and they vary materially in terms of their size usage of the system. For instance, transmission customers comprise small and large industrials, some of which make very little use of the grid except as a back-up to on-site generation, as well as distribution systems. Therefore, levying a fixed fee per customer or connection point to recover transmission residual costs would not follow principles of cost causation, and is likely to lead to inequitable charges as small customers would make the same financial contribution to residual costs as much larger customers.

63. In addition, it is not clear whether any billing determinant would be truly "non-avoidable" for many transmission customers. As explained above, large industrial customers that connect directly to the transmission system can choose to reduce their coincident or non-coincident demand by self-generating, or disconnecting from the

[19] AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 309.

grid and self-supplying the entirety of their energy needs. High transmission charges could also make it uneconomic to operate within Alberta. Hence, even a fixed charge per customer per month may be avoidable for a large industrial customer connected to the transmission grid.

64. As noted above, as an alternative to recovering residual costs from the customers with least price elastic demand or the billing determinants that are least avoidable, an alternative approach would be to use proportional mark-ups to uplift marginal cost-based tariffs. In this case, it is likely that proportional mark-ups would need to be large given the relative size of residual costs relative to marginal costs. Therefore, proportional mark-ups will likely significantly distort any price signal sent by the marginal cost component of the charge.

65. However, as noted above, the limitations associated with efficient recovery of residual costs are secondary to the limitations associated with the inability of the transmission tariff to accurately reflect marginal cost unless it has locational differentiation.

3.2.3. The lack of locational pricing would restrict or negate the efficiency benefits from the AESO introducing a marginal cost methodology

66. Economic theory shows that marginal cost prices may send more efficient signals to consumers of the impact of changes in load on the costs of transmission. However, these theoretical benefits of a marginal cost approach cannot be realised in the AESO's context, if rates of the transmission tariff do not differ based upon the location of load on the transmission system.

67. In simple terms, the AESO provides transmission capacity to move electricity from areas where the supply of in-merit energy exceeds demand, to areas where demand exceeds supply. Increasing demand in areas of surplus in-merit energy may therefore reduce transmission costs (implying a negative marginal cost), while higher demand increases transmission costs in areas where demand exceeds supply (implying a positive marginal cost). A marginal cost-based tariff that applies in all areas cannot reflect these differences and therefore cannot send efficient signals regarding the marginal transmission costs associated with of accommodating changes in demand in Alberta.

© NERA Economic Consulting

3.2.4. An embedded approach will tend to promote more efficient self-supply decisions than a marginal approach in the Albertan context

68. The AESO's current tariff methodology is an embedded cost approach. In contrast to the marginal cost approach, which aims to set a forward-looking signal regarding the additional costs that would be associated with future load growth, the embedded cost approach designs tariffs based on historical spending on capital investment and operating expenses during a specific time period.[20]

69. In this context, the embedded cost methodology seeks to signal to customers the long-run costs of providing transmission, in a way that identifies which costs have been incurred historically to accommodate (or have been caused by) particular patterns of usage, particular customers and/or particular services. Embedded methodologies need to be designed to achieve this objective, and thereby send signals to users regarding the historical costs associated with their usage of the transmission grid.

70. By setting charges to reflect the costs incurred historically to serve particular customers or types of grid usage, the embedded methodology can send signals through tariffs that reflect such patterns of cost causation. By ensuring that the structure of tariffs (the balance between fixed, demand-related, and energy-related tariffs), reflects the cost structure of the transmission grid, the tariff can encourage efficiency in users' self-supply decisions.

71. The embedded cost approach is commonly criticized for sending less efficient price signals to consumers, because prices may not reflect the cost of consuming the next unit of electricity. Instead, prices reflect the historical, average cost of service, so consumption decisions made in response to the tariff may be less efficient than if the tariff were set equal to marginal cost. However, in this particular context, i.e. electricity transmission in a jurisdiction where locational differentiation of transmission tariffs is not permitted, this common criticism of the embedded methodology would be unjustified. As we explain above, the AESO's Bulk and

[20] National Association of Regulatory Utility Commissioners (NARUC), Electric Utility Cost Allocation Manual, January 1992, pp. 12-14.

Regional tariff cannot accurately reflect the marginal cost of transmission without differing rates based upon the location of load on the transmission system.

72. Given this limitation of marginal cost-based pricing in this context, an embedded methodology provides a reasonable guide to the costs associated with particular customers' usage of the transmission system. We therefore recommend that a tariff based on an embedded cost approach is more likely to promote efficient self-supply decisions than a tariff based on marginal cost pricing principles.

73. Nonetheless, we quantify the likely effect of our recommended tariff design (as outlined in the presentation delivered at Stakeholder Session 5) on self-supply decisions by customers, as described further below.

3.3. Self-Supply in Alberta

74. As we discuss in Section 3.1.1, industrial customers tend to have a larger number of options to self-supply than residential or small commercial customers because they have larger loads. Industrial customers account for approximately 65 per cent of annual Alberta Internal Load ("AIL"). The remaining load comes from commercial customers (20 per cent), residential customers (13 per cent), and farms (3 per cent).[21]

75. Some industrial customers are already self-supplying under the current tariff. Approximately 24 per cent of annual AIL is self-supplied, or roughly 37 per cent of industrial load.[22] We understand that industrial customers choosing to self-supply include those with petrochemical facilities, pulp/paper and forestry facilities, and oil sands customers. In particular, we understand that oil sands industrial customers have invested in cogeneration self-supply options, and benefit from the production of heat for use in their production processes.[23]

76. The majority of remaining industrial customers which are not pursuing self-supply options are distribution-connected. Approximately 6 per cent of total AIL comes

[21] AESO (31 May 2020), Delivered Cost of Electricity Report, p. 9.

[22] AESO (31 May 2020), Delivered Cost of Electricity Report, p. 9.

[23] AESO (31 May 2020), Delivered Cost of Electricity Report, p. 9.

from transmission-connected industrial customers which are not currently self-supplying.

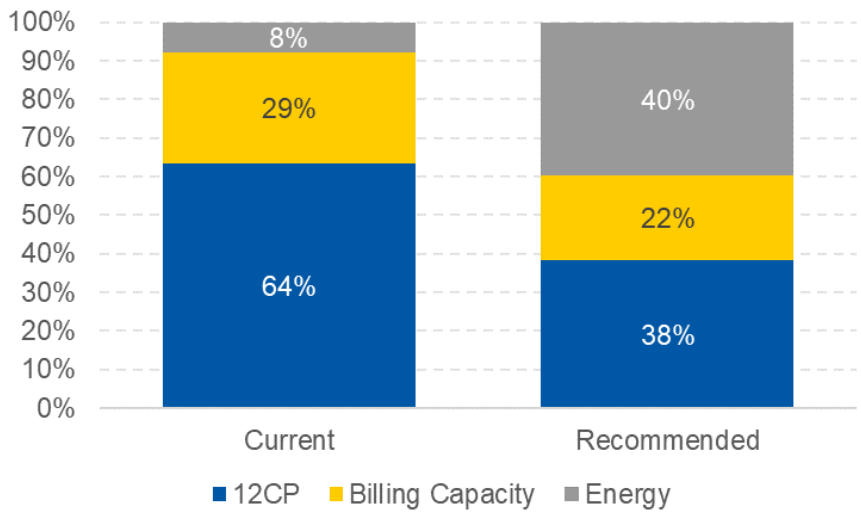
77. In addition to those industrial customers that have already invested in self-supply, other customers are responding to the current transmission tariff by reducing their load at times of 12CP.

3.4. The Recommended Tariff and Self-Supply

3.4.1. Impact of the change of tariff on customers

78. Our recommended tariff design recovers more costs from energy-based charges, and fewer costs from charges levied on billing capacity and 12CP, as illustrated in Figure 3.1 below.

Figure 3.1: Recovery of Bulk and Regional Costs Under Current and Recommended Tariff



Note: Based on 2020 data provided by the AESO. Excludes POD costs. Source: NERA analysis.

79. The change in tariff from the current methodology to our recommended methodology affects what customers pay for electricity in different ways depending on how and when they draw power from the grid.

80. In the panel chart below, we illustrate how our recommended tariff affects the amount that four illustrative customers would pay in transmission charges, assuming no other changes in their consumption behaviour.

A. In Panel A, we illustrate a baseload industrial customer. We construct its load profile from the assumptions used in the AESO's Delivered Cost of Electricity Report, and assume the customer has peak load of 6.77 megawatts (MW) with an average annual load of 4.97 MW (i.e. a load factor of 73 per cent). We assume the customer draws 6.77 MW of energy during times of coincident peak, and also has contract capacity of 6.77 MW.

B. In Panel B, we illustrate a baseload industrial customer, with similar characteristics to that in Panel A, but with average annual load of 6.77 MW (a load factor of 100 per cent).

C. In Panel C, we illustrate an industrial customer using the grid for back-up. The customer has very low average load of 0.35 MW (a load factor of 5 per cent). However, the customer may draw up to 6.77 MW of load at times when it needs to use the grid for back-up. We assume the customer does not use the grid for back-up during times of coincident peak, as defined by the 12 CP hours.

D. In Panel D, we illustrate an industrial customer with the same characteristics as the industrial customer in Panel A, but which avoids paying charges during the 12 CP hours through load management.

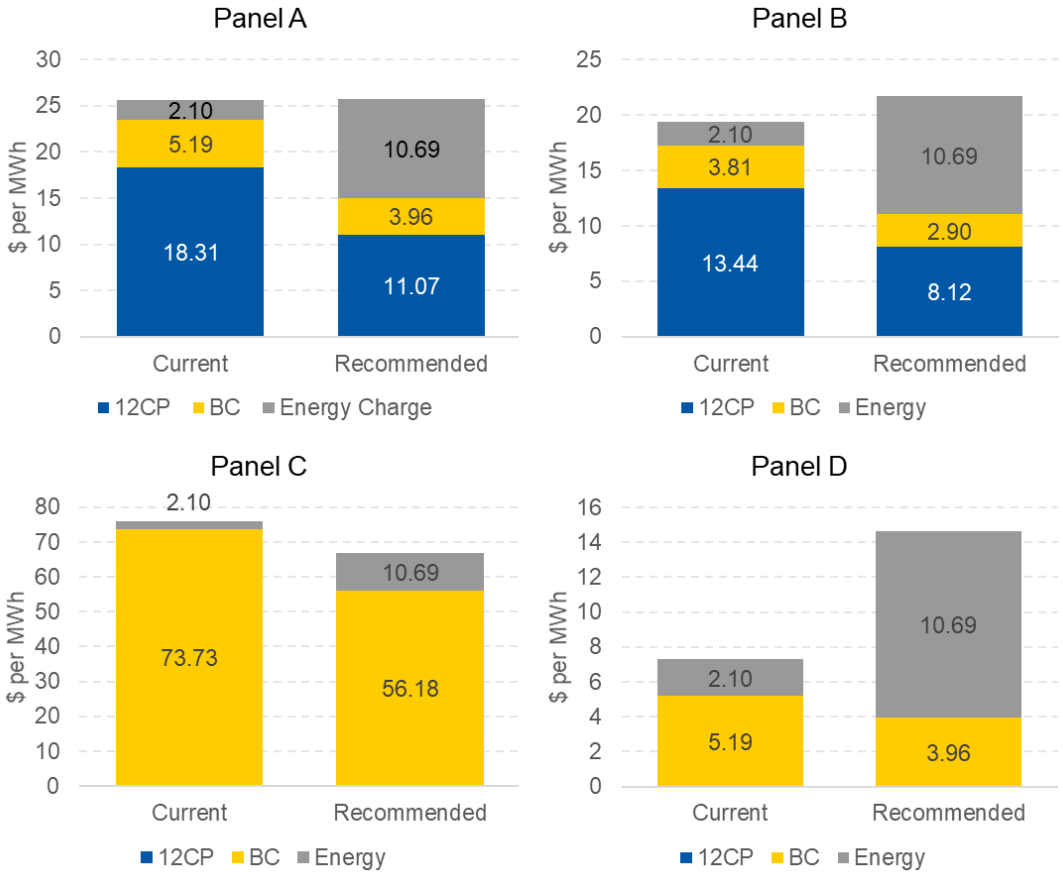
Figure 3.2: Change in Tariffs for Illustrative Industrial Customers



Note: Based on 2020 data. For simplicity, we assume a customers' consumption during coincident peak does not vary across years and therefore the movement to a five-year average 12CP charge does not impact customers charges. Excludes POD Costs. Source: NERA Illustration.

81. Implementing the classification and functionalization of costs envisaged by our recommended tariff design using data for 2020, our recommended tariff design would recover more costs from energy-based charges than the current tariff. Therefore, transmission charges for customers with high load factors and high energy consumption, such as the customer in Panel B would tend to increase under our recommended tariff. Also, customers which have previously avoided 12 CP hours, such as the customer in Panel D, could see a rise in charges under our recommended tariff, which recovers more costs from energy in all hours and fewer costs from charges levied on 12CP.

82. However, because our recommended tariff recovers fewer costs from the 12CP and contract capacity charges, customers with lower load factors that consume at these

© NERA Economic Consulting

times, such as customers in Panel A and Panel C, tend to have lower charges under our recommended tariff.

83. Our analysis suggests that some customers' incentives to self-supply would increase, while other customers' incentives to self-supply would reduce following our recommended change in the tariff.

84. However, our analysis above assumes customers' consumption behaviour does not change in response to the change in tariff. In reality, our recommended tariff design may incentivise customers to change how and when they use the grid:

A. The reduction in the 12CP charge may reduce customers' incentive to avoid consumption at times of coincident peak, thereby increasing usage of the grid at these times;

B. The reduction in the charge on contracted demand also increases customers' incentive to hold contracted capacity to the grid to use the grid as back-up, which may reduce incentives for grid defection; and

C. The increase in the energy charge may decrease customers' incentive to take energy from the grid across the year.

85. Such changes will tend to be efficient in the long-run, because our recommended tariff is more cost reflective than the current tariff for the reasons explained above and in the Stakeholder Session 5 presentation. The more cost reflective price signal will therefore promote more efficient decisions as to whether to self-supply. However, to help the AESO and stakeholders quantify the likely impact of the change in tariff on self-supply decisions, we have performed quantitative analysis to estimate the likely impact on industrial customers' decisions to self-supply resulting from our recommended tariff.

3.4.2. Incentives to self-supply under the current and recommended tariff

86. As explained below in Section 3.4.3, we have considered in detail how the change in tariff will affect all industrial customers' self-supply incentives. However, by way of an example, consider the case of the customer in Panel B above. This customer has a 100 per cent load factor, consuming 6.77 MW in all hours of the year. We assume

this customer is directly connected to the transmission system, thereby incurring only transmission charges and the cost of energy to purchase power from the grid.

87. For the purpose of this illustration, we assume that the customer could choose to self-supply using a baseload gas generator. We adopt the costs of a aeroderivative combustion engine ("ACE") plant with cost assumptions as detailed in the AESO's Cost of New Entrant Analysis.[24] We outline the cost assumptions for this plant in more detail in Appendix A.2.4. Given the customer has a load factor of 100 per cent, we compare the cost per MWh of self-supplying all of its energy with an ACE plant of capacity 6.77 MW relative to purchasing its power from the grid. We assume the customer remains connected to the grid for back-up but does not draw any energy.

88. We illustrate the costs of self-supply relative to purchasing power under the current and our recommended tariff per MWh of consumption across a year in Figure 3.3 below. The figure uses a baseload pool price of $49.39 per MWh, based on the average pool price in 2020.[25]

89. Our analysis suggests that the costs of self-supply across the year for the Panel B customer are below the costs of purchasing power from the grid under both the current and recommended transmission tariff designs. This finding corroborates the AESO's Delivered Cost of Electricity Report, see Figure 3.4 below.[26] The AESO identifies, using a different customer load profile and self-supply technology, that the delivered cost of electricity through self-supply (the purple, yellow, and blue bars) is lower for the illustrative, transmission-connected industrial customer than the costs of purchasing energy from the grid under the current tariff (the purple and yellow bars).

© NERA Economic Consulting

90. However, as we discuss in Section 3.3, only 37 per cent of industrial load is currently self-supplied, despite the suggestion from the analysis above that the economics of self-supply is favourable under the current tariff:

A. Industrial customers with different load profiles have different costs of purchasing power from the grid or self-supplying, as compared to the baseload customer used in the example above.

B. Industrials incur additional costs to self-supply beyond the capital and operating costs required to build and operate self-supply generation units. Other costs may include the costs of land (which may not be available at all close to industrial sites), costs of personnel, and the costs/risks associated with additional business complexity or administration. These costs are additional factors not captured in the above analysis which can lead to industrial customers continuing to purchase power from the grid, even if a simple cost comparison suggests it may be cheaper to self-supply.

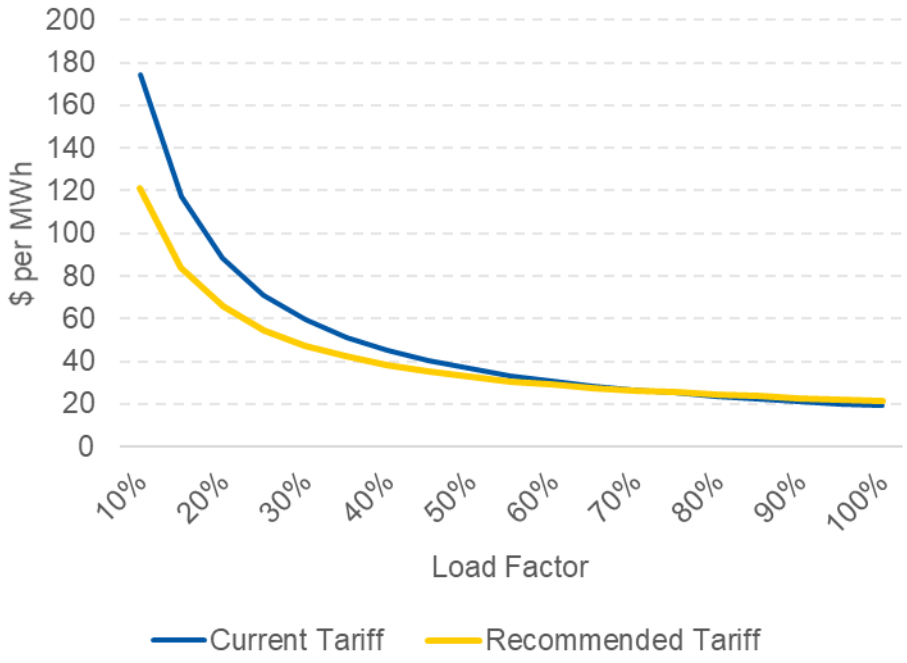
C. On the other hand, the options for customers to self-supply are more diverse than in our analysis above, as customers can choose from an array of technologies to self-supply such as baseload or peaking generation. It is reasonable to assume that customers will choose the least-cost self-supply option across technologies when considering the costs of self-supply compared to purchasing power from the grid.

91. As well as showing that self-supply appears cheaper than purchasing power from the grid, our analysis in Figure 3.3 suggests that the self-supply incentives for customers with a high load factor do not change materially following the change in tariff. Therefore, this illustrative analysis suggests that the increase in costs associated with purchasing power from the grid for a customer with a high load factor is likely to be small.

92. Moreover, for customers with lower load factors like those in Panel A and Panel C, we would expect the customers to face a lower incentive to self-supply, as the cost of purchasing power falls under our recommended tariff relative to the current tariff. In Figure 3.5 below, we illustrate transmission charges for customers with the same

characteristics as the customer in Panel B, with billing capacity and 12CP consumption of 6.77 MW, but with varying load factors. We do not illustrate the costs of purchasing energy from the grid in the Figure. Transmission charges are lower under our recommended tariff for this illustrative customer up to a load factor of between 70 to 75 per cent.

Figure 3.5: Illustrative Transmission Charges for Illustrative Customers with Varying Load Factors Under Current and Recommended Transmission Tariff (2020 C$)



Note: POD Costs Excluded. Source: NERA Illustration.

93. For customers currently avoiding 12CP, such as in Panel D, it is more difficult to determine the impact of the change in tariff on their incentive to self-supply. Whilst these customers face a lower incentive to self-supply during times of coincident peak under the recommended tariff, they face higher costs of purchasing energy from the grid during times other than coincident peak.

3.4.3. Our modelling procedure to estimate the customer response to our recommended tariff

94. In reality, customers' optimal decisions to self-supply are more complicated than the illustrative customer in Figure 3.3 above. Customers with high load factors rarely have 100 per cent load factors, which means their incentives to self-supply depend on cost savings that vary by the hours in which they are consuming power from the grid.

Moreover, because customers take different amounts of energy across hours, it may be optimal for them to install generators that allow them to self-supply all or part of their load, or a combination of types of generators to use in different hours of the year.

95. Therefore, to better assess the potential customer response to the change in tariff we conducted quantitative modelling to analyse how self-supply decisions may change for industrial sites after the introduction of our recommended tariff, which we explain in more detail in Appendix A.

96. Our modelling procedure uses hourly load data provided by the AESO for 133 industrial sites in 2018 and 2019 to assess whether and to what extent it would be economic for each site to self-supply rather than purchase power from the grid across the year, considering both wholesale prices and transmission tariffs. For each customer, we estimate the optimal amount of self-supply under both the current and our recommended tariff to examine how self-supply will change in response to our recommended tariff.

97. However, because our modelling procedure predicts the amount of self-supply based on whether it would be cheaper to self-supply or buy power from the grid, it significantly overstates the tendency for customers to deploy self-supply options. As we discuss in Section 3.1.1, this arises because we do not account for other costs customers face to self-supply that we cannot observe, such as land costs or capital constraints.

98. To address this, we introduce a statistical procedure to estimate how likely customers have been in the past to self-supply, as a function of the potential cost savings a customer could make from self-supplying, based on each customers' characteristics. We assess the performance of our statistical approach by using it to predict existing actual self-supply under the current tariff. We find our approach accurately predicts self-supply (see Appendix A.3.2).

99. We then use our statistical approach to predict actual customer responses to the change in the incentive to self-supply under our recommended tariff.

100. Our analysis focuses on the likely customer response to the increase in the energy charge under our recommended tariff relative to the current tariff. We do not consider

customer response to the decrease in 12CP charges under our recommended tariff relative to the current tariff, except through the extent to which it changes their decisions to optimally self-supply. In other words, we do not consider how decreases in the 12CP charge under our recommended tariff may increase customers' gross load during times of 12CP, and therefore our analysis is conservative with respect to self-supply by customers during times of coincident peak.

101. Overall, our approach predicts an extremely limited increase in self-supply by industrial customers under our recommended tariff. We estimate that self-supply could increase under our recommended tariff by up to 2,801 GWh which is equivalent to 4.69 per cent of the total metered energy billing determinant, used to calculate the transmission energy charge, in 2019.

102. As we explain in Appendix A, our estimate of customer response is a total effect that includes any dynamic responses by customers to self-supply decisions of other customers. This "dynamic response" accounts for the effect of higher self-supply pushing up tariffs levied on the remaining demand, which may increase further the incentives customers have to self-supply.

103. It is also equivalent to a total cost shift of C$ 29.92 million (in real 2019 terms) from self-supply customers to other customers, which is approximately 1.9 per cent of the total revenue requirement for B&R costs in 2019.

104. Therefore, whilst, in Section 3.1.2, we identified the possibility that a tariff set to recover historical costs will cause customers to self-supply, despite sending efficient price signals over the costs of providing transmission in the long run. Our modelling approach suggests that under current system conditions, any reduction in energy demand from the transmission system resulting from our recommended tariff design is likely to be extremely limited.

3.5. Future Trends in the Economics of Self-Supply

105. While the impact of our recommended tariff on self-supply is likely to be limited given the current costs of self-supply, the economic case for self-supply in Alberta is likely to worsen in the next decade.

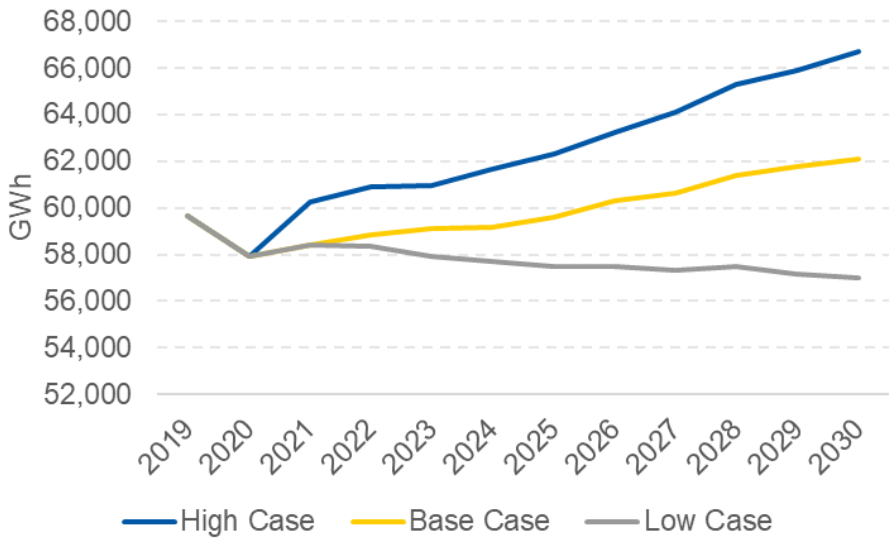
106. As we discuss in Section 3.1.1, customers' decisions to self-supply will necessarily be forward-looking because the upfront capital costs of investing in generators are offset by savings relative to purchasing power from the grid over future years (i.e. over the useful life of the generator). Therefore, not only do the current incentives to self-supply affect a customer's decision to self-supply, but also their expectations regarding future cost savings relative to purchasing power from the grid.

107. We identify two potential drivers of the future costs that customers would incur (and benefits they would obtain) by self-supplying power rather than purchasing it from the grid: future trends in transmission charges and future trends in the variable costs of self-supply.

3.5.1. Future trends in transmission charges

108. The AESO's low growth sensitivity projection of demand transmission service load in Alberta shows declining forecast energy consumption through to 2030, as shown in Figure 3.6. We focus on the low growth scenario to ensure we do not understate the potential for transmission tariffs to rise, and therefore avoid understating customers' incentive to self-supply.

Figure 3.6: AESO's Forecast of Total Energy Consumption



Source: NERA Analysis of AESO Data.[27]

[27] AESO data sourced from its 2020 Q4 Update – Transmission Rate Projection.

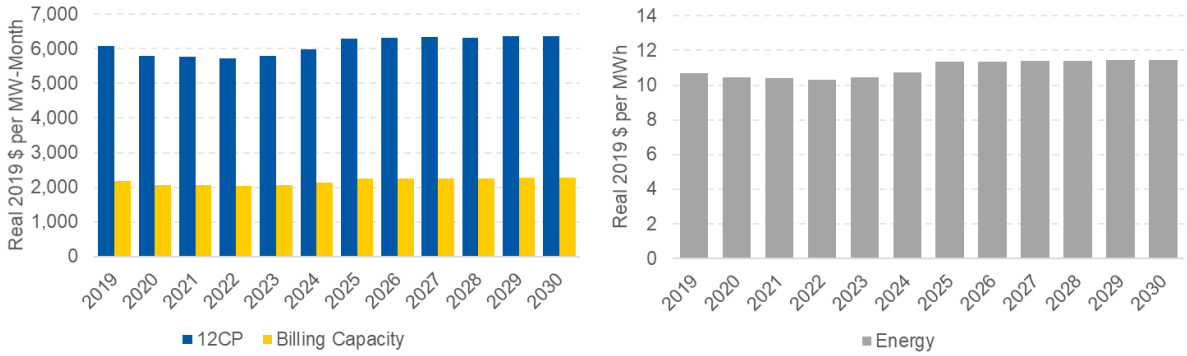
109. Reductions in demand which are coupled with the same revenue requirement can lead to a rise in transmission charges in order to ensure cost recovery. Using the low growth sensitivity forecast, the AESO's forecast revenue requirement, and the same percentage recovery of costs by billing determinant as 2020, we forecast transmission charges under our recommended tariff design.[28] Our forecast is an approximation because, amongst other reasons:

A. We assume the same revenue requirement forecast under the baseline demand projection is appropriate for the low demand forecast projection.

B. We do not account for changes in the classification of costs in our methodology in light of the changing use of the system over the forecast horizon.

110. We illustrate our forecast of transmission charges (in real 2019 C$) in Figure 3.7 below.

Figure 3.7: Forecast Transmission Charges Under Our Recommended Tariff in the AESO's Low Energy Growth Scenario



Note: Source: NERA analysis of AESO data. Inflation forecast from 2020 taken unchanged from the AESO's Rate Projection, and originally sourced from Statistics Canada Table 326-0020, Data Vector V41692327, and Conference Board of Canada Data Vector RPCPIA.

111. Our forecast suggests that transmission charges will rise slightly as energy consumption falls over the period to 2030. In absence of a reduction in other costs of purchasing power from the grid, such as the pool price which may fall with lower energy consumption, higher transmission charges will increase the costs of purchasing

[28] We also construct a low growth sensitivity forecast of coincident metered demand that forms the charging basis of the 12CP billing determinant, and billing capacity. To do so, we examine the ratio of total annual energy consumption and coincident metered demand and billing capacity in the AESO's central projection. We then apply the same ratio to forecast the coincident metered demand billing determinant and billing capacity billing determinant from the low growth forecast of energy consumption.

© NERA Economic Consulting

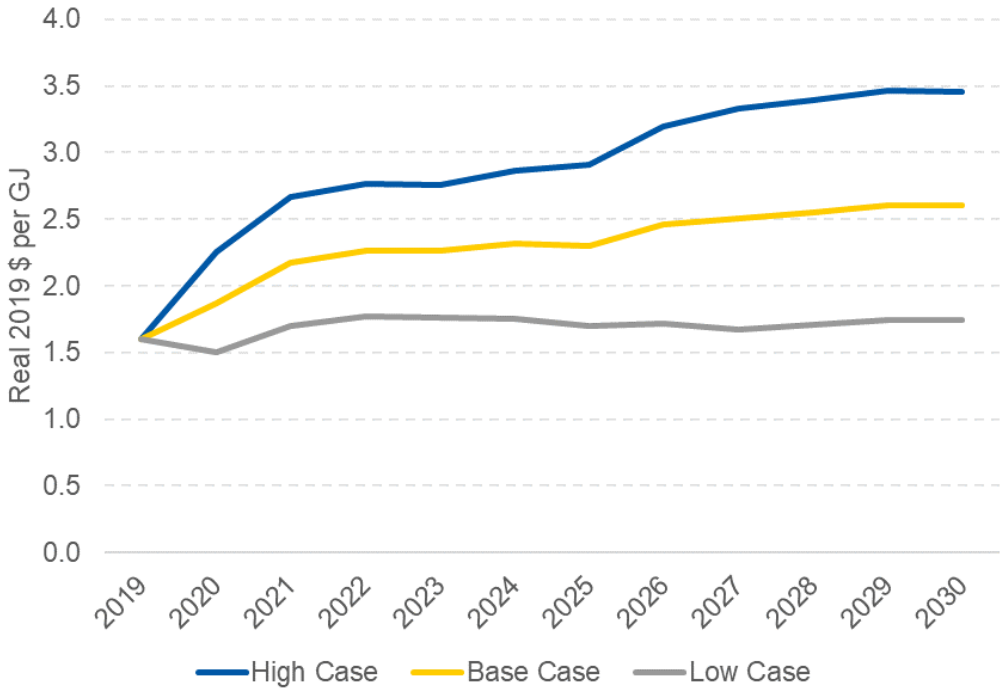
power from the grid for some customers thereby, in theory, increasing the cost savings associated with self-supply.

3.5.2. Future trends in the fuel and carbon costs of self-supply

112. However, the costs of self-supply are also likely to change over this timeframe. Higher costs of self-supply reduce the cost savings associated with self-supply relative to purchasing power from the grid. We identify two key drivers of the costs of generating power to self-supply that are particularly likely to change in the coming years: fuel costs and the carbon price.

113. We have examined the forecast annual average AECO-C natural gas price from 2019 to 2030 as published by the Alberta Energy Regulator (AER).[29] We show the forecast in Figure 3.8 below. As shown, the gas price is forecast to rise in real terms relative to 2021.

Figure 3.8: AER's Forecast AECO-C Natural Gas Price

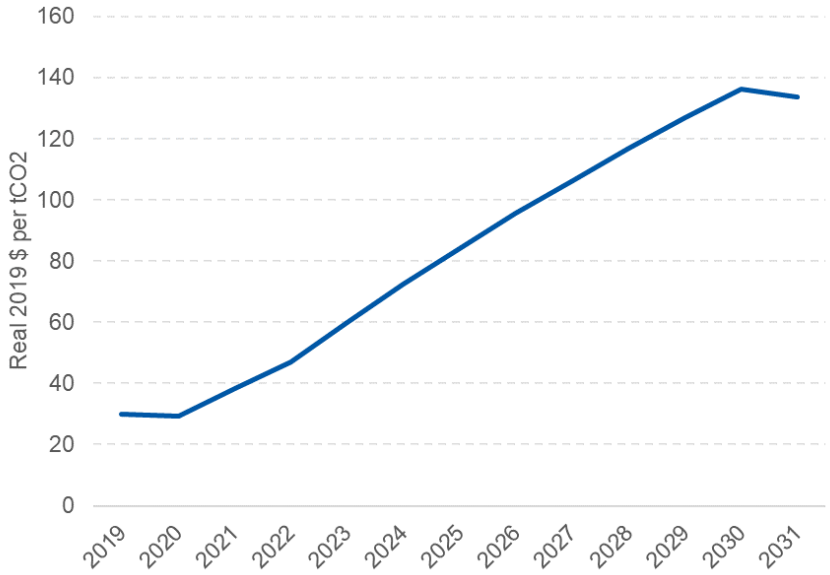


Source: NERA analysis of AER data.

[29] Alberta Energy Regulators Forecast of AECO-C gas prices updated June 2020 and accessed here: https://www.aer.ca/providing-information/data-and-reports/statistical-reports/st98/prices-and-capital-expenditure/natural-gas-prices/aeco-c-price. Last Accessed 12 May 2021.

114. We also examine forecast annual carbon prices. The Federal Government implemented a federal carbon tax through the Greenhouse Gas Pollution Pricing Act in 2018.[30] We understand that under this regime the carbon tax, which is currently $30 per tCO2, is intended to rise to $170 per tCO2 in 2030, with a $10 per tCO2 rise in 2021 and 2022, and a $15 per tCO2 rise per year starting from 2023. We illustrate this rise (in real 2019 C$) in Figure 3.9 below.

Figure 3.9: Forecast Federal Carbon Tax



Source: NERA analysis.

115. The impact of future growth in gas and carbon prices on incentives to self-supply depends on how the costs of self-supply change *relative* to the pool price. Higher carbon and gas prices will increase the wholesale price for power, as generators incur higher costs to produce power. Higher pool prices increase the costs of purchasing power from the grid, and thereby increase the cost savings associated with self-supply. On the other hand, rising gas prices and carbon prices will also result in higher costs of self-supply using gas-based generation, decreasing the cost savings associated with self-supply relative to purchasing power from the grid.

116. To the extent that gas-fired generators are the marginal source of in-merit energy in the wholesale market, the relative efficiency of grid-connected and gas generators

[30] *Greenhouse Gas Pollution Pricing Act*, SC 2018, c 12, s 186.

used to self-supply will drive whether changes in the carbon or gas price will impact the pool price more or less than the costs of self-supply. Customers installing gas generators to self-supply will likely not require, or be able to install, generators of the scale used to generate power for the grid. The smaller generators used to self-supply are likely to be less efficient than the larger generators used to generate power for the grid. Using more inefficient generators means that self-supplying customers will need to use more gas to generate energy relative to grid-serving generators, resulting in higher gas costs and carbon costs per unit of energy generated.

117. To examine this, we compare the heat rates of representative plants that customers could use to self-supply with the heat rates of representative gas plants used to generate power for the system.[31] More specifically, we compare the heat rates of a combined cycle gas plant (CCGT) that we assume would be used to generate power for the grid with the heat rates of an ACE plant and a gas-fired reciprocating internal combustion engine ("RICE") which could be used to self-supply. We detail the assumptions and sources of costs of each plant in Appendix A.2.4. We compare the heat rates in Table 3.1 below.

Table 3.1: Comparison of Heat Rates Across System and Self-Supply Plant

		CCGT	ACE	RICE
Heat Rate	GJ per MWh	6.72	9.68	10.50
Additional Heat Rate Relative to CCGT	*GJ per MWh*		*2.96*	*3.78*

Note: Heat Rates Treated as Net HHV, underlying sources do not specify. Source: NERA Analysis.

118. As the table shows, both ACE and RICE plants require more fuel relative to a CCGT to produce one MWh of electricity. We convert the additional energy requirement per MWh shown in the table to an additional gas requirement per MWh, and then an additional gas cost per MWh using the AER Low Case. We select the Low Case to ensure we do not understate the economic case for self-supply.

[31] The heat rate of a plant specifies how much gas is required to generate a unit of power. Whilst peaking, simple cycle gas plants also generate power for the system, they do so in fewer hours of the year than baseload, combined cycle gas plants which is why we consider baseload plants in our analysis.

119. Given the ACE and RICE plants require more gas to produce one MWh, self-suppliers will also incur more in carbon costs to run the plant. To calculate the additional carbon costs, we assume the ACE and RICE plants are subject to the federal carbon tax, and are also part of Alberta's Technology Innovation and Emissions Reduction ("TIER") regulation, meaning that they only pay carbon taxes on emissions above the "best in gas" standard. We assume the CCGT in our analysis has emissions that meet the best in gas standard.[32] Therefore, because we are examining the carbon costs associated with the *incremental* costs incurred by self-supply technologies relative to a best in gas CCGT, we assume all of the additional gas used by ACE or RICE technologies relative to CCGT will be subject to carbon taxes.

120. To calculate the additional carbon emissions associated with the additional gas required by self-supply technologies, we calculate the extra emissions associated with the higher gas requirement for ACE and RICE technologies relative to CCGT plants, as shown in Table 3.2 below. We then calculate the carbon costs for alternative technologies by multiplying this extra volume of emissions by the carbon price shown in Figure 3.9 above.

Table 3.2: Additional Emissions Associated with Self-Supply

	Units	System CCGT	ACE	RICE
Heat Rate (Net HHV)	GJ per MWh	6.72	9.68	10.50
Emissions Rate	t per MWh	0.338	0.486	0.527
Additional Gas Use Per MWh	GJ per MWh		2.96	3.78
Additional Emissions Per MWh	t per MWh		0.1485	0.1898

**Note: As we discuss in Appendix A.2.4, we recalculate the emissions rate for all plants using (i) tCO2/therm = 0.0053[33] (ii) Btu/therm = 100,000;[34] therm/GJ = 0.105506.[35] Source: NERA Analysis.*

[32] Whilst we recognise that the current "best in gas" standard corresponds to an emissions rate of 0.37 CO2t per MWh, we also understand that the threshold rate should fall over time. Therefore, we assume self-suppliers pay carbon taxes on all fuel use above the emissions rate of the system CCGT of 0.338 CO2t per MWh from the EIA in our analysis.

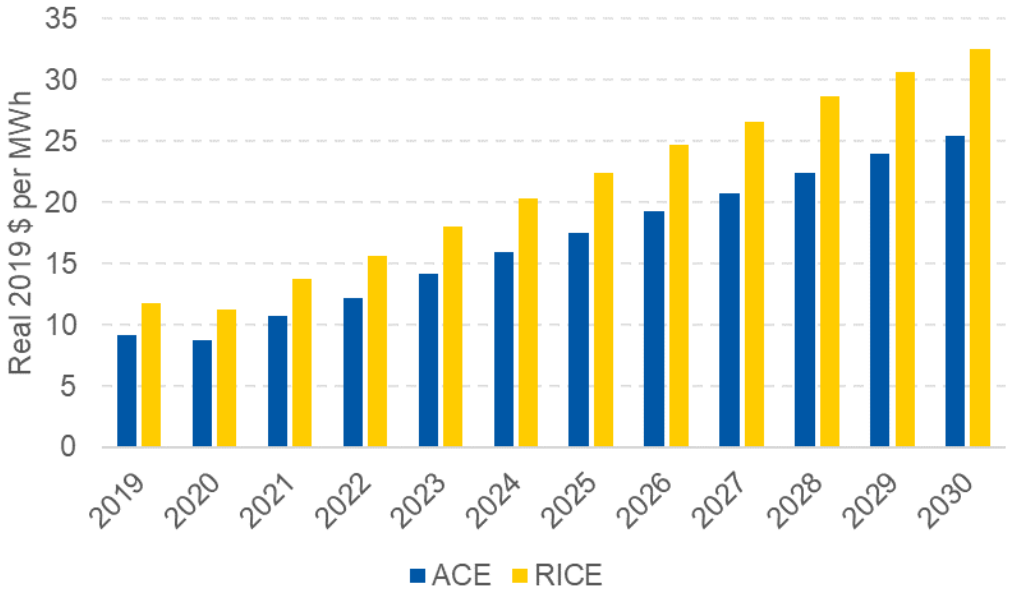
121. We illustrate the additional variable costs of self-supply using the ACE and RICE generator relative to a system CCGT in Figure 3.10 below. The figure shows the additional costs to generate one MWh using self-supply technologies rather than purchasing energy generated using a CCGT, supplied to the customer via the transmission grid.

122. The figure shows that we expect rising carbon and gas costs will make self-supply technologies more expensive over time, when compared to the cost of purchasing power from the grid:

A. By 2030, the fuel and carbon costs of producing a MWh using an ACE or RICE generator will be $25.40 or $32.47 per MWh (in real 2019 terms) more expensive, respectively, than producing that MWh using grid technology, relative to around $10 per MWh today.

B. Therefore, upward pressure on fuel and carbon prices is expected to reduce the incentive to self-supply.

Figure 3.10: Forecast Additional Fuel and Carbon Costs of Self-Supply Relative to CCGT Technology



Source: NERA analysis.

3.5.3. Future trends in the economics of self-supply

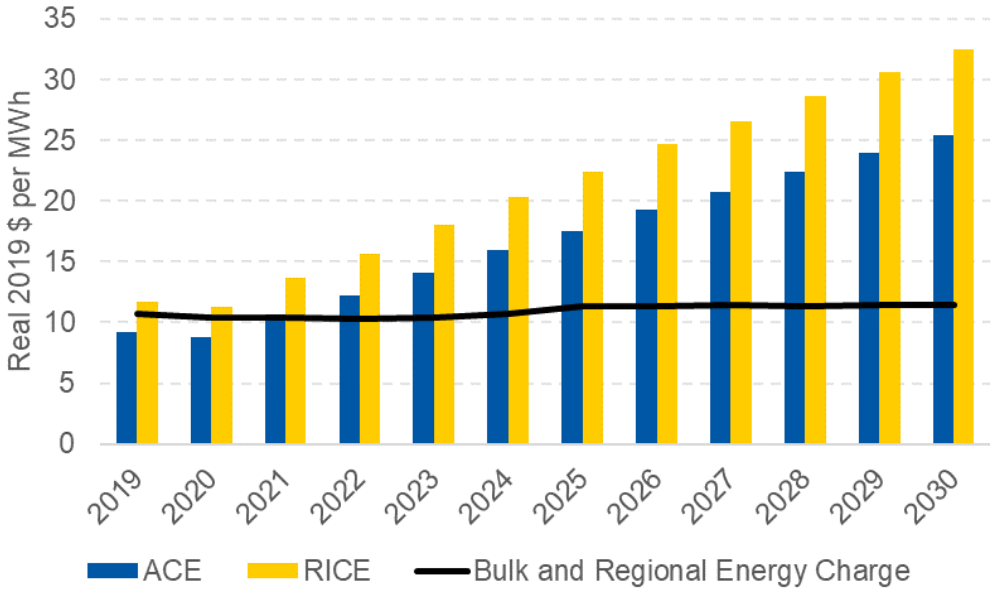
123. We illustrate in Figure 3.11 below the two drivers of future trends in the economics of self-supply:

A. Changes to the energy component of the transmission tariff under our recommended tariff structure,[36] and assuming the AESO's low demand growth scenario (see also Figure 3.7); and

B. The additional fuel and carbon costs of self-supply, driven by changes in gas and carbon prices (see also Figure 3.10).

124. The figure illustrates the additional costs incurred to self-supply one MWh using self-supply technology instead of purchasing that power from the grid (where it is generated by a CCGT), compared to the energy component of the transmission tariff.

Figure 3.11: Future Trends in the Economics of Self-Supply



Source: NERA analysis.

125. While we show above and in Appendix A that in current cost conditions, we estimate that our recommended tariff will not materially increase self-supply, the projection in Figure 3.11 shows that the economics of self-supply for industrial customers is also

[36] We focus on the energy charge of the transmission tariff because it is the component that increases in our recommended tariff relative to the current tariff.

set to worsen in the coming years due to the effects of carbon pricing. In other words, even though we estimate that our recommended change in the tariff will have a small effect on self-supply volumes, the incentives to self-supply are set to worsen materially in the coming years which means we expect an increase in energy charges will not cause significant reductions in the volume of energy supplied from the grid.

4. Summary

126. Some electricity industry participants (both in Alberta and globally) may have legitimate concerns about the risks of grid bypass and grid defection, especially in relation to transmission and distribution companies that already recover all (or the majority of) their costs from tariffs levied on energy consumption.

127. A proportionate response to these concerns is to adjust tariffs to ensure they have a cost structure that reflects the cost structure of the service in question as closely as possible, which we strive to do through our recommended tariff design.

128. Designing a tariff with the intention of minimising self-supply would be a disproportionate response. In fact, customers should be encouraged to self-supply when the costs they incur to do so are below the costs of supplying them from the grid. Self-supply decisions in response to cost reflective tariffs promote efficiency in the overall supply of electricity, and will tend to reduce the costs faced by the customers who purchase energy from the grid.

129. In the AESO's case, it is currently charging for the majority of its costs through a 12CP charge, the extent to which is not justified on grounds of cost causation as explained in the Stakeholder Session 5 presentation. The current tariff is therefore promoting *inefficient* self-supply decisions aiming to avoid 12CP charges. By contrast, our recommended tariff better reflects the dual purposes of transmission in Alberta: to meet peak demand and accommodate the flow of in-merit energy.

130. Therefore, customer response to the change in transmission tariff through different self-supply decisions will improve efficiency because the new transmission tariff is more cost reflective. However, even if a tariff is designed to reflect the cost structure of the transmission system, and therefore promote efficient decisions to use the grid or self-supply in the long-term, there remains a possibility that a tariff set to recover historical costs will cause customers to inefficiently self-supply in the short-term in cases where those customers make lower contributions to historical costs.

131. We therefore estimate customer response to our recommended tariff using a modelling procedure. We estimate that self-supply could increase under our recommended tariff by up to 2,801 GWh which is equivalent to a shift in costs from

self-supplying customers to other customers of approximately 1.90 per cent of the total revenue requirement for bulk and regional costs in 2019. Our estimate of customer response is a total effect that includes any dynamic responses by customers to self-supply decisions of other customers.

132. Our estimate of customer response ignores the potential for customers to increase purchasing of power from the grid during times of coincident peak in response to lower 12CP charges in our recommended tariff relative to the current tariff.

133. Hence, we predict an extremely limited increase in self-supply by industrial customers under our recommended tariff, and any change in customers' self-supply decisions that does arise will tend to result in more efficient patterns of electricity usage than under the current methodology.

Appendix A. Estimating Customer Response to Our Recommended Tariff

A.1. Overview of Our Approach

134. As we discuss in Section 3.4, our analysis of customers' decisions to self-supply using illustrative consumption profiles simplifies the self-supply decision. Customers' actual self-supply decisions depend on how and when they use electricity, which for most customers vary across hours of the year (and is rarely at a 100 per cent load factor as we assume for the customer in Panel B in Figure 3.2).

135. Customers consider different self-supply technologies, and different ways of optimally self-supplying using those technologies, depending on their consumption profile. For instance, as we discuss in Paragraph 27, customers can consider peaking generators for use during hours of the year when the costs of purchasing power from the grid are highest, or baseload generators for use during a larger number of hours of the year.

136. The choice of self-supply technology depends on the individual circumstances of the customer, and balances the fixed and variable costs of operating the self-supply technology with the avoided costs of purchasing power from the grid, which vary across hours of the year with the customers' consumption profile.

137. In order to better assess how customers may respond to our recommended transmission tariff, we model the optimal self-supply decisions for industrial sites in Alberta. Our approach is formed of three steps:

    A. ***Step 1:*** We construct a model that estimates the optimal self-supply decisions for industrial sites across Alberta, based on a simple comparison of the costs of purchasing power from the grid and self-generation costs. The model allows different customers (industrial sites) to use different self-supply technologies, and operate those technologies in different ways to optimise their decision to self-supply or purchase power from the grid. By performing this optimization for each customer, we estimate the optimal amount of self-supply across Alberta under the current and our recommended tariff.

B. ***Step 2:*** However, this optimisation model overstates the actual self-supply for customers because we do not model other costs associated with self-supply such as costs and risks associated with business complexity or financing. Consequently, actual self-supply by customers will be lower than the optimal self-supply identified by the model in Step 1, or "incentive to self-supply", that we model. To estimate how customers' actual self-supply decisions will be affected by a change in the transmission tariff, we estimate a regression equation to capture how likely customers are to self-supply, given the economic incentive to self-supply identified in Step 1. This regression also controls for customers' characteristics such as size, location, and industry.

C. ***Step 3:*** We then use our regression to predict customers' response to the change in incentive to self-supply under our recommended tariff.

138. In this Appendix, we detail our modelling approach and results from each of the above steps in more detail.

A.2. Step 1: Modelling the Optimal Self-Supply Decision for Customers

139. We examine the optimal self-supply decision for customers using site-level, hourly gross load data in 2018 and 2019.[37] Of the 564 sites for which we have load data, 133 are sites with only load from industrial customers. We use the 133 industrial-only sites in our analysis.

A. We assume that there is a single industrial customer at each industrial-only site that is responsible for the entire load at that site.[38]

B. Sites which are not industrial-only, are often constituted by a mixture of industrial, residential, commercial, or other customers. We are unable to use these sites as we cannot distinguish the profile of consumption belonging to industrial customers from residential customers.

[37] By gross load, we mean total consumption of power at the site, irrespective of whether that power is sourced from the grid or through self-supply. We use net load to refer to the site's purchase of power from the grid, in other words, its gross load less any self-supply it chooses to undertake. We rely on AESO site-level load data in our analysis.

[38] Our assumption likely leads us to overstate self-supply, assuming a single industrial customer at each site means self-supply may be more economic than if the site comprised multiple, smaller customers.

140. For each industrial customer (site), we calculate both the costs of purchasing power from the grid without self-supplying and the customers' optimal self-supply decision in 2018 and 2019. To perform these calculations, we use the procedure described below.

A.2.1. We group hours of the year to reduce the computational requirements of the model

141. In order to reduce the computational requirements of the model, we group similar hours of the year together using a Price Duration Curve approach. In total we define 53 groups of hours that are similar in terms of the costs that would be incurred to purchase power from the grid.

142. We define separate groups of hours for 2018 and 2019 based on the pool price in 2018 and 2019 respectively. More specifically:

A. The first 51 groups of hours are defined by percentiles of the distribution of hourly pool prices observed during the year in question.[39]

B. The 52nd group of hours is defined to capture rare incidences of scarcity pricing in the pool, where the pool price equals the price cap of $1000 per MWh. If we did not define the 52nd group of hours in this way, the average price of the 51st group of hours would be high as it would be influenced by these rare occurrences of scarcity pricing, which would distort our estimate of the self-supply decision in the hours in the 51st bucket.

C. The last group of hours is defined to contain 12CP hours only.[40] We separate 12CP hours to allow customers' self-supply decisions to change in 12CP hours in order to avoid the 12CP charge. Our model likely overstates customer response, because we assume that all customers can perfectly predict hours of 12CP.

143. Having grouped the hours of the year in this way, we calculate the average pool price and each customers' average gross demand in each group of hours. The average pool

[39] This corresponds to prices every 2nd percentile, with an additional price group to capture prices close to zero.

[40] Whilst in reality, 12CP is defined by a fifteen-minute interval, we are restricted by the data to look at hours of 12CP. We levy the 12CP charge on customer consumption during the hour of 12CP.

price and average demand during each group of hours defines a "representative hour" that applies to all hours within this group.

144. The tables below show the Price Duration Curves used by the model to characterise the costs of purchasing electricity from the wholesale market in 2018 and 2019.

Table A.1: Price Duration Curve (2018)

Note: Billing capacity charge not shown in transmission tariff. Source: NERA Analysis of AESO Data. Note: some "groups" appear to have zero hours because pool prices are only specified to 2 decimal places, so hours are allocated to a single group where two or more groups have identical prices.

145. The Price Duration Curves above use historical hourly pool prices from 2018 and 2019.[41] They also use actual bulk and regional transmission charges in 2018 and 2019 to calculate transmission tariffs under the current tariff design.

146. We calculate transmission costs under our recommended tariff design using the approach described in the Stakeholder Session 5 presentation, using historical data on billing determinants, the total revenue requirement, and allocation factors calculated from hourly demand and generation data by area in each year.

147. We summarise the transmission charges that are used under our recommended tariff and the current tariff in 2018 and 2019 in Table A.3 below.

[41] Data provided by the AESO.

Table A.3: Bulk and Regional Transmission Charges Under Current and Our Recommended Tariff in 2018 and 2019

Current Tariff	2018	2019
12 CP ($ per MW-month)	10,177	10,524
BC ($ per MW-month)	2,281	2,359
Energy ($ per MWh)	2.04	2.13
Recommended Tariff	**2018**	**2019**
12 CP ($ per MW-month)	5,093	6,065
BC ($ per MW-month)	1,816	2,180
Energy ($ per MWh)	8.80	10.68

Note: Billing determinants sourced from AESO data. They may differ to those presented at the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5. Billing determinants are 96,044 (2018) and 97,698 (2019) MW-months for 12CP, 154,214 (2018) and 156,984 (2019) MW-months for billing capacity, and 61,000 (2018) and 59,678 (2019) GWh for energy consumption. Source: NERA Analysis.

A.2.2. We calculate how much each customer would pay if it did not self-supply

148. For each industrial customer, we calculate how much the customer would pay to purchase all of its gross demand from the grid under the current and recommended tariff in 2018 and 2019. We use the Price Duration Curves shown above and each customer's total gross demand (in MWh) within each group of hours.[42]

149. We summarise the costs of purchasing power from the grid across all customers under the current and recommended tariff in Figure A.1 below. The total cost that all industrial customers would have incurred to purchase their gross energy requirement from the grid would have increased slightly under our recommended tariff in 2019 relative to the current tariff, but decreased slightly in 2018.

A. The costs of purchasing power from the pool do not change between the two tariff scenarios, as we assume the pool price remains unchanged.

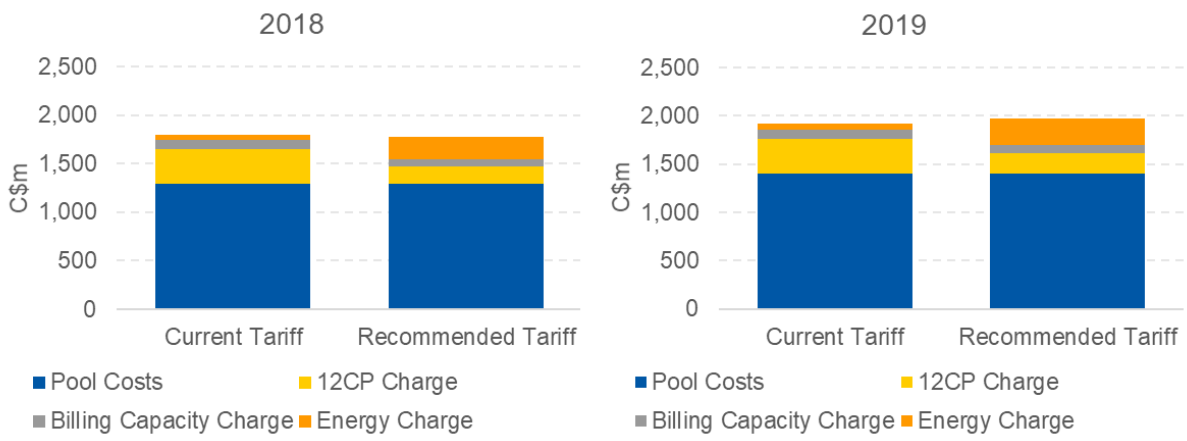
[42] Whilst our use of gross load data allows us to control for customers' existing self-supply decisions, we are unable to control for their load management decisions. In other words, a customer currently avoiding 12CP by reducing or eliminating its load during the 12CP hour, but without self-supplying, appears as if the customer has zero load in the hour. This means that we assume that the customer always chooses to avoid 12CP, if it is currently choosing to do so under the current tariff. Given our recommended tariff reduces the costs recovered by 12CP, our approach is likely to overstate the degree of 12CP avoidance under our recommended tariff.

B. The cost of 12CP charges falls under our recommended tariff, as the 12CP charge is lower under our recommended tariff design.

C. The cost of billing capacity charges falls under our recommended tariff. In our modelling, we assume customers' contract capacity is unchanged irrespective of its self-supply decision, as we assume the customer always relies on the grid for back-up.

D. The costs of paying the energy charge of the transmission tariff rise under our recommended tariff, as the energy charge is higher.

Figure A.1: Costs of Purchasing Power from the Grid Under the Current and Our Recommended Tariff



Note: POD costs not shown. Source: NERA analysis of AESO data.

A.2.3. We perform modelling to optimise the self-supply decision for each customer

150. We then perform optimisation modelling to identify the self-supply decision for each customer that would minimise its energy costs.

151. The model allows customers to choose to self-supply from two different technologies, or types of plant that we discuss in Appendix A.2.4 below. We do not constrain the capacity of plants that customers can build to be above a particular size, or the mix of the two alternative technologies. Hence, customers can build any amount (in MW terms) of either or both types of plant. This conservative assumption makes the costs of self-supply appear more attractive than they would be in reality, as generation units

typically come in standardised sizes, so each unit installed cannot be below a certain size.

152. Our model assumes that, if customers invest in plant, they incur capital costs and fixed O&M costs irrespective of how they subsequently use the plant. Having built a plant, the model optimises when the plant should be dispatched for self-supply, up to the capacity of the plant. When a customer self-supplies power from its plant:

A. It incurs variable O&M costs, fuels costs (natural gas costs), and carbon costs.[43]

B. It avoids serving its gross load from the pool, which would incur costs as per the Price Duration Curves shown above.

153. The model assumes that each customer chooses how many MW of each generation technology to build and the hours in which to run it, to minimise its total costs of meeting its gross load. The total cost function, which the model minimises using a "linear program" approach, constitutes the costs of purchasing power from the grid (pool price plus transmission costs) and the costs associated with self-supplying through investing in and running on-site plant.

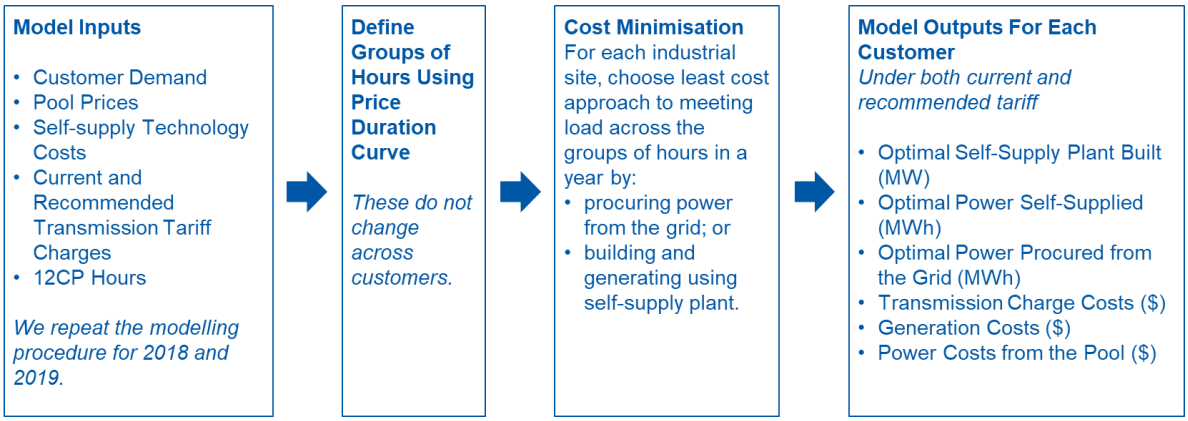
154. The model chooses how much capacity of each type of plant to build, and how much power to self-supply from each plant in each representative hour. It cannot produce more than the capacity of its plant in each representative hour, and the model is constrained to either use self-supply or power from the grid to meet the customer's gross load.[44]

155. We solve this linear programming problem for each customer (industrial site), under the current and recommended tariff, and separately for both 2018 and 2019. The solution of the problem for each customer defines its optimal self-supply under each tariff and in each year. We illustrate our modelling approach in Figure A.2 below.

[43] Throughout our analysis we source gas costs and forecasts from the Alberta Energy Regulators Forecast of AECO-C gas prices updated June 2020 and accessed here: https://www.aer.ca/providing-information/data-and-reports/statistical-reports/st98/prices-and-capital-expenditure/natural-gas-prices/aeco-c-price. Last Accessed 12 May 2021.

[44] We assume that customers cannot use self-supply technology to export power to the grid.

Figure A.2: Illustration of Our Modelling Approach



Source: NERA illustration.

A.2.4. Assumed self-supply technologies

156. We allow the model to choose between two technologies for self-supply:

A. An aeroderivative combustion engine ("ACE") fuelled by natural gas. The costs and assumptions of the ACE are derived from an AESO-commissioned study on the Cost of New Entry Analysis: Combustion Turbines and Combined-Cycle Plants.[45]

B. A reciprocating internal combustion engine ("RICE") fuelled by natural gas. The RICE costs and assumptions are derived from the AESO Delivered Cost of Energy Report.

157. We summarise our assumptions and sources for costs and operating conditions of each technology, the ACE and RICE, in Table A.4 and Table A.5 below respectively.

Table A.5: RICE Plant Cost Assumptions and Sources (2019 C$)

	Units	**RICE**	**Assumption/Source**
Initial Capex	*$/kW*	2,200	AESO Delivered Cost of Electricity Report 2020.
Heat Rate	*GJ/MWh*	10.50	AESO Delivered Cost of Electricity Report 2020.
Variable O&M	*$/MWh*	9.77	AESO Delivered Cost of Electricity Report 2020.
Fixed O&M	*$/kW-year*	0.00	AESO Delivered Cost of Electricity Report 2020. No fixed O&M costs mentioned in report so assumed to be zero. The risk with our assumption is that we understate the costs of self-supply technologies.
Lifetime	*years*	25	NERA assumption based on lifetime of plants cited in other sources. The AESO cites a 25-year asset life for a simple cycle gas plant in its Summary of Integrated Capacity and Energy Revenue Modelling, but a 20-year asset life for the ACE in the Cost of New Entry Analysis. In order to ensure we do not overstate the costs of self-supply, we assume a 25-year asset life.
Build time	*years*	2	Based on an internal combustion engine as cited by the EIA.
Emissions Intensity	*t/MWh*	0.53	NERA Calculation using (i) tCO2/therm = 0.0053[49] (ii) Btu/therm = 100,000;[50] therm/GJ = 0.105506.[51]
Rate of return	*%*	8.20%	NERA assumption based on rate of return cited by AESO for a simple cycle gas turbine in its Summary of Integrated Capacity and Energy Revenue Modelling.

Source: NERA Analysis of AESO (31 May 2020), Delivered Cost of Electricity Report; and Energy Information Administration (February 2021), Assumptions to the Annual Energy Outlook 2021: Electricity Market Module.

158. As can be seen in the above tables, the ACE and RICE have different cost profiles. The ACE has higher fixed costs each year than the RICE. However, the ACE has lower variable costs of generation than the RICE. We summarise the fixed and variable costs of each technology in Table A.6 below.

[49] EIA, Greenhouse Gases Equivalencies Calculator - Calculations and References, Last Accessed 17 May 2021, Link: https://www.epa.gov/energy/greenhouse-gases-equivalencies-calculator-calculations-and-references.

[50] EIA, FAQs, Last Accessed 17 May 2021, Link: https://www.eia.gov/tools/faqs/faq.php?id=45&t=8

[51] EIA, Energy Conversion Calculators – Natural Gas, Last Accessed 17 May 2021, Link: https://www.eia.gov/energyexplained/units-and-calculators/energy-conversion-calculators.php

Table A.6: ACE and RICE Variable and Fixed Costs (2019 C$)

	ACE	RICE
Fixed Cost ($/kW/yr)	228	210
Variable Cost ($/MWh)	23.35	31.29

Source: NERA Analysis

159. Therefore, the ACE is a self-supply option similar to the baseload generation option that we outline in Paragraph 27 above. Whilst it is more expensive to build, it is more economically viable than RICE technology when run for more hours of the year, due to its lower variable costs. On the other hand, the RICE is similar to the peaking generation option that we outline in Paragraph 27 above. Whilst it is cheaper to build, it is only more economic than the ACE in fewer hours, due to its higher variable costs.

160. We considered a range of potential self-supply technologies in our analysis, drawing on both AESO studies as well as studies from the US Energy Information Administration ("EIA"). We summarise the characteristics of some of the alternative options we considered in Table A.7 below.

A. A key component of our assumption of available self-supply technologies is the size of the plant. For instance, whilst grid-scale CCGTs are more efficient than our chosen technologies, in practice, most industrial customers are unable to install a CCGT to self-supply because the minimum size of the plant is too large relative to an industrial customers' typical load.[52]

B. Therefore, we focus our analysis on plants with smaller minimum sizes for use in self-supply. In our optimization of the customers' self-supply decision, we do not constrain the minimum size of plant that the customer can build, and therefore our choice of self-supply technology should be appropriate for small-scale plant. Hence, we do not consider CCGT, Frame Combustion Turbine ("Frame CT"), and Simple Cycle Gas Turbine ("SCGT") technologies. Whilst the SCGT plant is similar in size to the ACE plant that we adopt, we consider the ACE plant to be

[52] For similar reasons, we assume that industrial customers cannot utilise intermittent technologies (combined with battery storage) because these technologies require significant land and therefore cannot be used to materially offset load. The AESO states, for industrial and large commercial customers, that "area available for PV arrays is likely insufficient to offset load" in its discussion of self-supply technologies in its Delivered Cost of Electricity Report. Source: AESO (May 2020), Delivered Cost of Electricity Report, p. 28.

more representative of the costs of installing self-supply technology, as the fixed cost estimate also includes other costs that merchant generators would incur in Alberta e.g. including an indicative cost of land.[53]

C. We considered using plant assumptions as detailed by the EIA in its Assumptions to the Annual Energy Outlook 2021.[54] More specifically, we considered utilising a distributed generation baseload gas plant ("DG Base"), and a distributed generation peaking gas plant ("DG Peak"). Both of these plants have small sizes of 2 MW and 1 MW respectively, and are therefore suitable for self-supply. The EIA also provides data for an Internal Combustion Engine ("ICE") which has a size of 21 MW which is likely more appropriate for self-supply options compared to the ACE which has a size of 93 MW.

D. However, these plants are not cost competitive compared to the ACE and RICE plants. To illustrate this, we calculate a screening curve for the remaining self-supply technologies. The screening curve illustrates, for each technology, the total costs of building a 1 kW plant and then operating that plant for various hours of the year, generating 1 kWh per hour that it operates. We illustrate our screening curve in Figure A.3 below. It shows that either ACE or RICE technologies are the least cost technologies, across any amount of running hours.

53 The AESO source for the CCGT and SCGT were also cited in the context of the proposed capacity market which was not enacted. Source: AESO (January 2018), Summary of Integrated Capacity and Energy Revenue Modelling.

A.2.5. Additional model assumptions

161. We also make assumptions relating to inflation, exchange rates, gas costs, and carbon costs. We detail these assumptions and our sources in Table A.8 below.

Table A.8: Overview of Model Assumptions

Assumption	Units	2018	2019	2020	Source
Exchange Rate	US$ to C$	1.2957	1.3269	1.3415	Bank of Canada, Annual Average Exchange Rates, Link: https://www.bankofcanada.ca/rates/exchange/annual-average-exchange-rates/, Last Accessed 05/05/2021.
Inflation Rate	%	1.40%	2.40%	1.84%	Inflation calculated as YoY percentage change in CPI from January each year. Source: Bank of Canada, Consumer Price Inflation, Link: https://www.bankofcanada.ca/rates/price-indexes/cpi/, Last Accessed 05/05/2021.

Source: NERA Analysis.

A.2.6. Estimating optimal self-supply for customers

162. We run the model to estimate each customer's optimal self-supply decision using data for both 2018 and 2019 under both the current and recommended tariff designs. Our optimization model chooses the least cost combination of self-supply and purchasing of power from the grid across the year for each customer to meet its load.

163. In Table A.9 below, we outline the optimal investment in ACE and RICE plant resulting from our model of optimal self-supply decisions across customers under the current and recommended tariff. We find that most customers in our model build ACE plant, which has higher fixed costs than the RICE plant but lower variable costs. Under the recommended tariff, customers invest in more ACE plant but less RICE plant, suggesting that customers find it optimal to self-supply in more hours of the year due to the higher energy charge, thereby opting for the baseload instead of peaking technology.

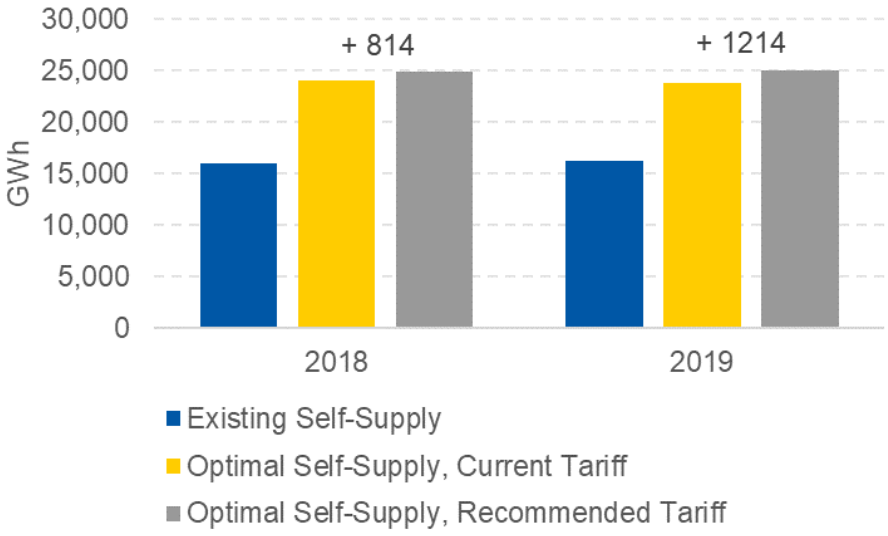
Table A.9: Modelled Optimal Self-Supply Plant Under Current and Recommended Tariff in 2018

	Capacity (MW)	ACE Capacity	RICE Capacity
Current Tariff	2,872	2,850	22
Recommended Tariff	2,893	2,887	6
Difference	21	37	-16

Source: NERA Analysis.

164. We illustrate the total change in energy self-supplied under the current and recommended tariff in Figure A.4 below. Our model suggests that optimal self-supply under the current tariff (yellow bars) is slightly lower than under our recommended tariff (grey bars). We find that moving from the current to the recommended tariff marginally increases optimal self-supply for customers in our sample by 814 GWh and 1,214 GWh in 2018 and 2019 respectively.

Figure A.4: Modelled Optimal Self-Supply Under Current and Recommended Tariff in 2018 and 2019



Source: NERA Analysis.

165. However, as can be seen in the figure, our model suggests much higher optimal self-supply under the current tariff (the yellow bars) than actually observed self-supply in 2018 and 2019 (the blue bars). Our model suggests optimal self-supply is approximately 50 and 47 per cent greater under the current tariff than actual self-

supply under the current tariff. This finding is similar to the AESO's finding in the Delivered Cost of Electricity Report, as we discuss in Section 3.4.2 above.

166. We would expect to observe this result for two key reasons:

A. Our model understates the cost of self-supply technologies. As we discuss in Appendix A.2.3, our model allows customers to build increments of capacity of self-supply technologies as we do not restrict the customer to a minimum size of plant. We also choose technologies available for self-supply that are more cost competitive than smaller plants appropriate for distributed generation but with higher operating costs.

B. Our model only considers the costs of self-supply associated with the fixed and variable costs of operating self-supply generators. In reality, customers incur other costs in their decision to self-supply, such as the costs and risks associated with business complexity and financing. Other industrial customers may not be able to self-supply due to their location in the province or lack of available land. We cannot directly observe these other costs associated with self-supply in the data available.

167. Therefore, to account for the additional costs associated with self-supply, we examine how customers' actual decisions to self-supply are linked to the incentive to self-supply identified by our optimisation modelling, as explained below.

A.3. Step 2: Estimating the Actual Self-Supply Response by Customers

168. We estimate a statistical relationship between actual self-supply decisions and the incentive to self-supply (as measured by the optimal self-supply generation amount predicted by our model in Step 1).[58]

169. We use an Ordinary Least Squares regression procedure to estimate the statistical relationship between actual self-supply and the incentive to self-supply across customers. In our regression, our dependent variable (the variable we are explaining)

[58] We could have utilized data for both 2018 and 2019 to estimate the statistical relationship. However, we only use data in 2018 so that we can test the performance of our model in predicting actual self-supply in 2019, as we discuss in Appendix A.3.2 below.

is total actual self-supply by customer across 2018 (in MWh), defined by the difference between each customer's metered gross demand and its metered net demand.

170. We use the total optimal self-supply by customer across 2018 (in MWh), taken from our model as our measure of the *incentive* to self-supply as an explanatory variable (the variable we are using to predict actual self-supply) in the regression. We illustrate our approach in Figure A.5.

Figure A.5: Illustration of Our Regression Approach

$$\text{Actual Self-Supply} = \alpha + \beta * (\text{Incentive to Self-Supply}) + \varepsilon$$

Where:

$$\text{Incentive to Self-Supply} = \text{Modelled Optimal Self-Supply}$$

α and β, are constants to be estimated, ε is an error term.

Source: NERA illustration.

171. Put simply, this procedure allows us to predict how much a customer would typically self-supply, as a function of how much an optimisation model suggests the customer should self-supply if it were making a least-cost trade-off between self-generation costs and purchasing power from the grid, as shown above.

A.3.1. We include a number of explanatory variables in our regression

172. We include a number of other explanatory variables that allow different customers to respond to the incentive to self-supply in different ways, depending on their characteristics. Formally, we use "interaction terms" in our regression which allow the statistical relationship between actual self-supply and the incentive to self-supply to change depending on customer characteristics. We include the following customer characteristics in our regression:

A. Contract Capacity: We allow the response of customers to the incentive to self-supply to change with contract capacity. As discussed in Appendix A.2, we assume each site contains a single industrial customer.

B. Industry Type: Customers' response to the incentive to self-supply might change depending on its industrial processes. We allow the response of customers to change with each customer's industry type. More specifically, we estimate different customer responses for the wood industry (pulp and paper or wood production), oilsands industry, pipeline industry, or other industry (chemical, steel, cement). We estimate a different customer response for customers with no listed industry.

C. Location in a City: We allow the response of customers to change if the customer is located in the Calgary or Edmonton planning region. Customers in more densely populated areas may have less land available for self-supply technology, reducing their responsiveness to the incentive to self-supply.

D. Industry System Designation ("ISD"): We allow the response of customers to change if the customer already has ISD status. We would expect customers with ISD status to be more responsive to the incentive to self-supply.

173. Formally, our regression is written in Table A.10 below.

Table A.10: Our Regression Approach

Type of Variable	Variable
Dependent Variable	Actual Self-Supply (MWh)
Constant	Constant
Explanatory Variable 1	Incentive to Self-Supply (MWh)
Explanatory Variable 2	Incentive to Self-Supply (MWh) x Contract Capacity (MW)
Explanatory Variable 3a	Incentive to Self-Supply (MWh) x Wood Industry (1/0 Dummy)
Explanatory Variable 3b	Incentive to Self-Supply (MWh) x Oilsands Industry (1/0 Dummy)
Explanatory Variable 3c	Incentive to Self-Supply (MWh) x Pipeline Industry (1/0 Dummy)
Explanatory Variable 3d	Incentive to Self-Supply (MWh) x Other Industry (1/0 Dummy)
Explanatory Variable 4	Incentive to Self-Supply (MWh) x Located in City (1/0 Dummy)
Explanatory Variable 5	Incentive to Self-Supply (MWh) x ISD (1/0 Dummy)
Residual	Residual Term

Note: A dummy variable takes the value of 1 if true for a customer or 0 otherwise. For instance, if a customer has an ISD then the dummy variable will equal 1, otherwise it will equal 0. Source: NERA Analysis.

A.3.2. We estimate our regression and analyse its predicative power using 2019 data

174. We estimate our regression using 2018 data and present our results in Table A.11.

Table A.11: Our Estimated Regression Using 2018 Data

Dependant Variable: MWh of Actual Self-Supply	Coefficient	p-Value
Incentive to Self-Supply *(MWh of Optimal Self-Supply as Estimated by Model)*	0.174	0.106
Interaction with ISD	0.485	0.000
Interaction with Contract Capacity	-0.001	0.000
Interaction with City	-0.301	0.185
R-Squared	0.9696	
Number of Observations	133	

Notes: Interactions with Industry Types Not Shown but Included in Model. All industry interaction explanatory variables are statistically significant with the exception of "pipeline". Incentive to self-supply is statistically significant when tested across all interaction terms. Source: NERA Analysis.

175. Our estimated regression suggests that as the incentive to self-supply increases, as measured by a 1 MWh increase in the optimal amount of self-supply identified by our model, actual self-supply by customers increases. We estimate how this relationship is affected by the characteristics of the customer:

    A. A customer with an ISD is found to be more responsive to the incentive to self-supply, increasing its actual self-supply by 0.485 MWh more than a customer without an ISD in response to a 1 MWh increase in the amount of self-supply that the optimisation model in Step 1 suggests is least cost.

    B. A customer located in the Edmonton or Calgary planning regions is found to be less responsive to the incentive to self-supply, increasing its actual self-supply by 0.301 MWh less than a customer outside these regions in response to a 1 MWh increase in the amount of self-supply that the optimisation model in Step 1 suggests is least cost.

    C. Contract capacity has a statistically significant and negative impact on the customer response to the incentive to self-supply. However, the size of this impact is very small.

176. Our regression also has a high degree of statistical fit, meaning that it explains the majority of the variation in actual self-supply across customers. Formally, the R-squared of our regression is 0.9696, meaning our regression explains 96.96 per cent of the variation in actual self-supply across customers in 2018 using the explanatory

variables. This is reassuring as it means our model has a strong predicative power to estimate actual self-supply from the amount of self-supply that the optimisation model in Step 1 suggests is least cost.

177. To further assess the predicative power of our regression, we use it to predict self-supply in 2018 and 2019 across industrial customers. We would expect our regression to perform well at predicting 2018 actual self-supply, because we estimate the regression using 2018 data. However, in this calculation we are particularly interested in the performance of our regression at predicting 2019 self-supply decisions, because this data is not used to calibrate the regression equation. We detail our results for our sample of customers in Table A.12 below.

Table A.12: Analysis of the Predicative Power of Our Regression

	2018	**2019**
Modelled Incentive to Self-Supply (GWh)	24,114	23,851
Actual Self-Supply (GWh)	16,055	16,245
Predicted Self-Supply Using Regression (GWh)	**16,624**	**16,534**
Difference Between Predicted and Actual Self-Supply (GWh)	570	289
Prediction Error Relative to Actual Self-Supply (%)	**3.55%**	**1.78%**

Source: NERA Analysis of AESO Data

178. Our regression performs well in predicting actual self-supply by customers in 2019. It predicts a volume of self-supply in 2019 within 2 per cent of the actual self-supply volume observed in that year. Therefore, we are reassured that our regression performs well at predicting actual self-supply based on data that is "out of sample", i.e. data that is not used to initially estimate the regression such as 2019 data.

179. Consequently, we are content that our regression predicts accurately the actual self-supply response by customers.

A.3.3. We considered alternative specifications of our regression

180. We considered an alternative specification of our regression which uses the cost savings associated with optimal self-supply relative to purchasing all power from the grid as a measure of the incentive to self-supply (rather than the MWh of optimal self-supply as in the "MWh Regression" above).

181. Similar to our "MWh Regression" our "Cost Regression" uses the same interaction terms to allow customers' responsiveness to the incentive to self-supply, as measured by our modelled costs savings associated with self-supply, to differ with their characteristics.

182. We estimate our "Cost Regression" using 2018 data and present our results in Table A.13.

Table A.13: Our Estimated "Cost Regression" Using 2018 Data

Dependant Variable: MWh of Actual Self-Supply	**Coefficient**	**p-Value**
Incentive to Self-Supply *(Cost Savings of Optimal Self-Supply as Estimated by Model)*	0.0093	0.103
Interaction with ISD	0.0254	0.000
Interaction with Contract Capacity	-0.0001	0.000
Interaction with City	-0.0172	0.169
R-Squared	0.9697	
Number of Observations	133	

Notes: Interactions with Industry Types Not Shown but Included in Model. All industry interactions explanatory variables are statistically significant with the exception of "pipeline". Incentive to self-supply is statistically significant when tested across all interaction terms. Source: NERA Analysis.

183. Our estimated "Cost Regression" suggests that as the incentive to self-supply increases, as measured by the cost savings associated with optimal self-supply relative to purchasing power from the grid in our model, actual self-supply by customers increases. We estimate that this relationship is also affected by the characteristics of the customer in a similar way to the "MWh Regression" as detailed in Table A.11 above.

184. Our "Cost Regression" also has a high degree of statistical fit, meaning that it explains the majority of the variation in actual self-supply across customers. The R-squared of our regression is 0.9697, meaning our regression explains 96.97 per cent of the variation in actual self-supply across customers in 2018 using the explanatory variables we include in it.

185. Similar to our test for the "MWh Regression", we further assess the predictive power of the "Cost Regression" by predicting self-supply in 2018 and 2019 across industrial

customers using our regression. We detail our results for our sample of customers in Table A.14 below.

Table A.14: Analysis of the Predicative Power of Our Regression

	2018	**2019**
Modelled Incentive to Self-Supply (GWh)	24,114	23,851
Actual Self-Supply (GWh)	16,055	16,245
Predicted Self-Supply Using Regression (GWh)	**16,605**	**19,561**
Difference Between Predicted and Actual Self-Supply (GWh)	550	3,316
Prediction Error Relative to Actual Self-Supply (%)	**3.43%**	**20.41%**

Source: NERA Analysis of AESO Data

186. Our "Cost Regression" performs better than our "MWh Regression" at predicting self-supply by customers in 2018.

187. However, our "Cost Regression" performs less well at predicting 2019 self-supply than our "MWh Regression", resulting in it predicting self-supply that is approximately 20 per cent higher than actually observed under the current tariff. We therefore use our "MWh Regression" to predict the actual self-supply response by customers to our recommended tariff in Appendix A.4 below.[59]

A.4. Step 3: Our Estimate of Self-Supply by Customers

A.4.1. Estimating the change in self-supply volumes due to the change in tariff design

188. Using our preferred specification, the "MWh Regression", we predict how self-supply by industrial customers would change under our recommended tariff design using data for 2018 and 2019. We report our results in Table A.15 below. We calculate two changes in self-supply:

A. We calculate the difference between predicted self-supply under our recommended tariff and predicted self-supply under the current tariff, where both are predicted using our modelling and regression procedure described above.

[59] We also considered logarithmic regressions to estimate the percentage increase in actual self-supply in response to a percentage increase in the incentive to self-supply. However, we could only estimate the logarithmic model on customers who are currently self-supplying (to prevent introducing non-linearity to the data) and these customers may be systematically different to the customers not self-supplying, leading to systematic bias in our estimate of self-supply.

This is shown in Row C of the table below. This calculation shows the change in self-supply predicted by our modelling procedure due to the change in the tariff design.

B. We calculate the difference between predicted self-supply under our recommended tariff and *actual* self-supply, as observed under the current tariff. This is shown in Row E of the table below. In other words, this calculation compares our modelled projection of self-supply after the change in the tariff design to the actual volume of self-supply today, i.e. under the current methodology.

Table A.15: Our Estimate of Customer Self-Supply in 2018 and 2019 Under Our Recommended Tariff

	Units: GWh	**2018**	**2019**
A	Predicted Self-Supply Under Recommended Tariff	17,249	17,401
B	Predicted Self-Supply Under Current Tariff	16,624	16,534
C = A – B	**Change in Self-Supply Under Recommended Tariff Relative to *Predicted* Self-Supply Under Current Tariff**	**625**	**867**
D	Actual Self-Supply Under Current Tariff	16,055	16,245
E = A – D	**Change in Self-Supply Under Recommended Tariff Relative to *Actual* Self-Supply Under Current Tariff**	**1,194**	**1,156**

Source: NERA Analysis.

189. We therefore predict an increase in self-supply across customers in our sample of between 625 and 1,194 GWh, depending on the approach used.

190. As we discuss in Appendix A.3.2, our regression overstates self-supply when compared against actual self-supply under the current tariff. Therefore, we control for this tendency by comparing our estimate of self-supply under the recommended tariff with *predicted* self-supply under the current tariff using our modelling procedure (Row C), rather than compare it to *actual* self-supply under the current tariff. If we do this, our model predicts an increase in self-supply across customers in our sample of 625 to 867 GWh.

191. We only model the optimal self-supply decision for industrial-only sites. Other industrial customers are located on shared sites with residential and other customers.

Therefore, to ensure we do not understate the incentive to self-supply, we scale our results to account for the industrial customers located on sites outside of our sample. More specifically, we calculate the scaling factor by examining the proportion of total industrial contract capacity constituted by our sample, and scaling by the result, as we show in Table A.16 below.

Table A.16: Calculation of the Scaling Factor for Our Modelling

A	Industrial-Only Site Contract Capacity	3,470 MW
B	Total Industrial Contract Capacity	7,186 MW
C = B / A	Scaling Factor	2.071

Source: NERA Analysis of AESO Data.

192. Scaling our results using this factor, **we estimate that self-supply will increase under our recommended tariff by 1,294 to 2,473 GWh relative to the current tariff** (not controlling for our model's tendency to overstate self-supply). This is equivalent to 2.17 to 4.14 per cent of the total metered energy billing determinant, used to calculate the transmission energy charge, in 2019.

193. Therefore, we estimate that customer response to our recommended tariff will be extremely limited.

A.4.2. We also considered whether a further customer response might arise from lower energy demand increasing the tariff

194. As customers choose to self-supply, the total metered energy billing determinant reduces. The AESO's revenue requirement does not change in the short run due to changes in demand,[60] so if customers choose to self-supply, the AESO needs to recover the same revenue requirement from a smaller billing determinant, resulting in a higher energy charge.[61] Therefore, whilst we estimate above an initial or "direct" self-supply response of between 1,294 to 2,473 GWh, we also need to account for any

[60] In the long run, as we discuss in Section 3.1.2, changes in self-supply decisions will result in changes in the AESO's costs.

[61] In practice, our recommended tariff methodology will adjust the division of costs with the changing use of the grid, as we estimate classification and allocation factors based on area level data. Therefore, decisions to self-supply will impact the classification of costs to energy. For simplicity, we maintain the same classification of costs for the purposes of this exercise.

In addition, reductions in energy consumption will also reduce the pool price and therefore the costs associated with purchasing electricity from the grid. Again for simplicity, we do not account for this factor in our analysis leading us to potentially overstate the self-supply response.

further self-supply response resulting from the direct self-supply response increasing the transmission tariff to the remaining customers.

195. We therefore recalculate our recommended tariff, with the energy charge recalculated using total metered energy *less* the direct self-supply response.[62] We use our highest estimate of the self-supply response (2,473 GWh) to recalculate the tariff. Our recalculated tariff has a higher energy charge but the same 12CP and billing capacity charge. We then estimate the change in self-supply using the same modelling procedure described above.

196. Having completed this procedure to estimate the "secondary" impact, we repeat the procedure a third time. We summarise our calculations and results in Table A.17 and Figure A.6 below.

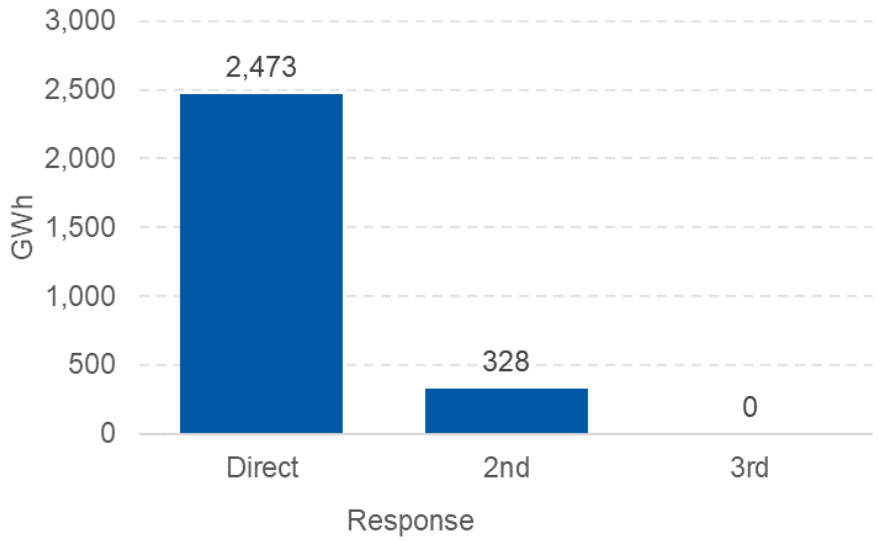
Table A.17: Our Estimate of the Dynamic Self-Supply Response to Our Recommended Tariff

	Direct	2nd	3rd
Costs Recovered from Energy Charge (C$m)	638	638	638
Energy Billing Determinant (GWh)	59,678	57,205	56,877
Energy Charge ($ per MWh)	10.68	11.14	11.21
Estimated Self-Supply Under Recommended Tariff (GWh)	**17,249**	**17,407**	**17,407**
Estimated Self-Supply Under Current Tariff (GWh)	16,055		
Additional Self-Supply Response (After Scaling, GWh)	**2,473**	**328**	**0**

*Note: * Numbers from 2018 as we take our maximum estimate of self-supply as our direct response to the tariff. Remaining numbers estimated using 2019 data. Source: NERA Analysis*

62 We use 2019 data in this modelling exercise.

Figure A.6: Our Estimate of the Dynamic Self-Supply Response to Our Recommended Tariff



Source: NERA Analysis.

197. These results show that any further increase in self-supply would be extremely limited. Even taking the top end of our estimated range, we estimate the total self-supply response will total 2,801 GWh. This is equivalent to 4.69 per cent of the total metered energy billing determinant, used to calculate the transmission energy charge, in 2019. It is also equivalent to a total cost shift of C$ 29.92 million (in real 2019 terms) from self-supply customers to other customers, which is approximately 4.69 per cent of total costs allocated to the flow of in-merit energy in 2019 and 1.90 per cent of the total revenue requirement for bulk and regional costs in 2019.

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

June 3, 2021

Public

Notice

In accordance with its mandate to operate in the public interest, the AESO will be audio recording this session and making the session recording available to the general public at www.aeso.ca. The accessibility of these discussions is important to ensure the openness and transparency of this AESO process, and to facilitate the participation of stakeholders. Participation in this session is completely voluntary and subject to the terms of this notice.

The collection of personal information by the AESO for this session will be used for the purpose of capturing stakeholder input for the Bulk and Regional Tariff Design engagement sessions. This information is collected in accordance with Section 33(c) of the *Freedom of Information and Protection of Privacy Act*. If you have any questions or concerns regarding how your information will be handled, please contact the Director, Information and Governance Services at 2500, 330 – 5th Avenue S.W., Calgary, Alberta, T2P 0L4, by telephone at 403-539-2528, or by email at privacy@aeso.ca.

Using Zoom – Asking questions

- Two ways to ask questions if you are accessing the webinar using your computer or smartphone
  - Click “Raise Hand” and the host will be notified that you would like to ask a question. The host will unmute your microphone, you in turn will need to unmute your microphone and then you can ask your question. Your name will appear on the screen, but your camera will remain turned off.
  - Click “Lower Hand” to lower it if needed.
  - You can also ask questions by tapping the “Q&A” button and typing them in. You’re able to up-vote questions that have been already asked.
- If you are accessing the webinar via conference call
  - If you would like to ask a question during the Q&A portion, on your phone’s dial pad, hit *9 and the host will see that you have raised your hand. The host will unmute your microphone, you in turn will need to unmute your microphone by hitting *6 and then you can ask your question. Your number will appear on the screen.

Stakeholder participation

The participation of everyone here is critical to the engagement process. To ensure everyone has the opportunity to participate, we ask you to:

- Listen to understand others' perspectives
- Disagree respectfully
- Balance airtime fairly
- Keep an open mind

Welcome and Introductions

Public

Session purpose and objectives

- The purpose of this session is to engage stakeholders in a discussion of Session 5 stakeholder feedback or follow-up and key questions raised by the Alberta Utilities Commission (AUC) staff, and to provide additional clarity and build mutual understanding of the AESO's preferred rate design and stakeholder concerns
- The session objectives include:
  - Share our learnings on Session 5 stakeholder feedback or follow-up
  - Present and seek stakeholder input on additional information on preferred rate design, including analysis of the potential response to the incentives provided in the rate design
  - Present responses to key questions raised by AUC staff
  - Seek to understand outstanding stakeholder concerns

Agenda

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose and session objectives • Application filing extension request	AESO / Stack'd
8:15 – 8:45	Recap of preferred rate design and summary of stakeholder feedback received	AESO
8:45 – 9:15	Appropriateness of the flat energy charge • Time of use and dynamic pricing • On-peak versus off-peak charges • Mix/max load factor energy charges • Q&A	AESO / NERA
915 – 10:15	Cost recovery through avoidable charges and efficiency • Avoidable and non-avoidable charges • Efficiency • Q&A	AESO / NERA
10:15 – 10:45	Break	
10:45 – 11:45	Analysis of self-supply in response to the preferred rate design • Self-supply analysis • Q&A	AESO / NERA
11:45 – 12:45	Analysis of the short-term impact of the preferred rate design on the energy market • Energy charge • Coincident peak charge • Q&A	AESO
12:45 – 12:55	Session close-out and next steps	AESO

Overview of Engagement Process

Public

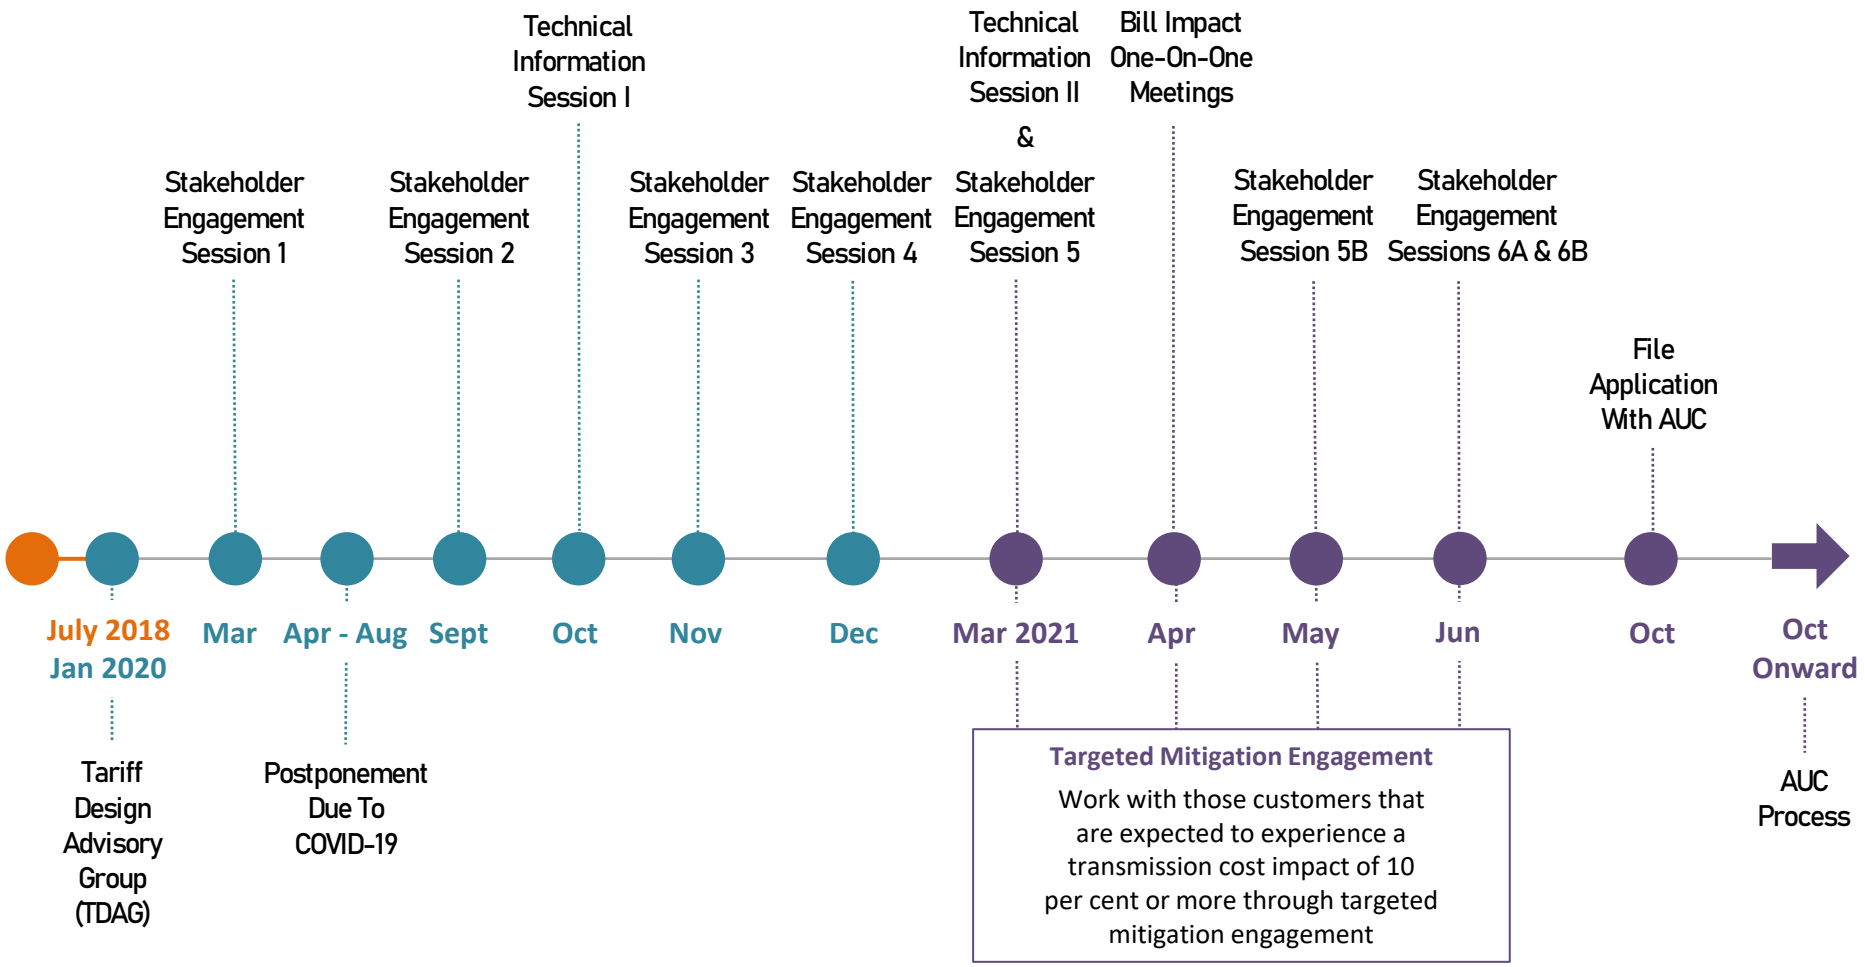
AESO Stakeholder Engagement Framework

Stakeholder engagement

The AESO's stakeholder engagement will:

- Ensure that stakeholders' needs and interests are consistently, transparently and meaningfully considered in the development of a rate design proposal for bulk and regional cost recovery;
- Provide clear objectives to be examined and evaluated in the development of a rate design proposal for bulk and regional cost recovery;
- Assist stakeholders in understanding and evaluating the AESO's preferred rate design;
- Supply stakeholders with tools that will allow them to consider and assess the impact of the AESO's preferred rate design; and
- Identify areas of alignment in order to support an efficient regulatory process.

Stakeholder engagement timeline



2018-19 2020 2021

Your participation

- Your participation to date has been very insightful to the AESO in understanding your perspectives and helping the AESO develop its preferred rate design proposal
- Your continued participation in this engagement is critical to help us prepare a well-informed application to the AUC for the benefit of Albertans
- We are looking for collaborative solutions to minimize the disruption for customers who are impacted by these changes, and your continued engagement is critical for our success
- AESO recognizes the importance of providing clarity on this initiative for all of Alberta's electricity consumers

Recap of Preferred Rate Design

Public

Cost allocation and cost causation

- Cost causation, cost responsibility, and cost reflective rates all relate to the same concept of linking the costs with cost drivers
- The costs of the transmission system are shared, and are not attributable to direct actions of specific, identifiable participants
  - Different types of transmission system use drive different types of costs
  - Cost causation is used to relate the types of use that drive costs and the costs of transmission
    - Investment in transmission results from forecasts, engineering studies, and the combined behaviours of all customers
    - Because costs are not attributable to one specific participant or behaviour, the relationship between transmission costs and cost drivers is representative

Responds to AUC staff questions 1.6 (a) and (c)

Preferred rate design aligns costs with drivers

- The preferred rate design characterizes use of the system to allocate transmission costs
  - Divides costs between demand-related cost drivers and costs driven by facilitating in-merit flow of energy
  - Divides demand costs between costs associated with coincident peak consumption and customer's own peak loads
  - Energy charge will increase; peak and billing capacity charge will decrease relative to current tariff
  - No changes to the types of charges in current tariff: billing capacity charge, energy charge, peak charge (with five-year trailing average)
- Better aligns charges with use of the system
  - Customers who wish to manage costs through peak avoidance remain able to do so, but charges are more reflective of the transmission costs associated with response

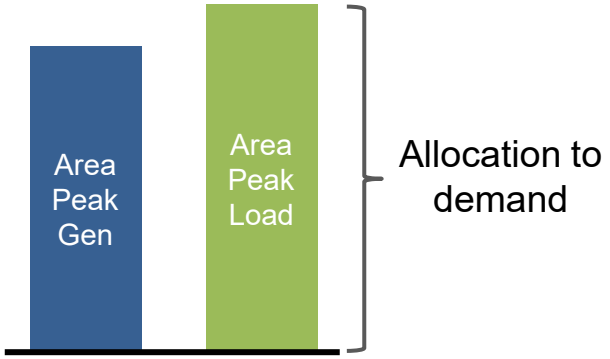
Minimum and actual system calculation

The following methodology is applied to determine the portion of costs allocated to demand and energy

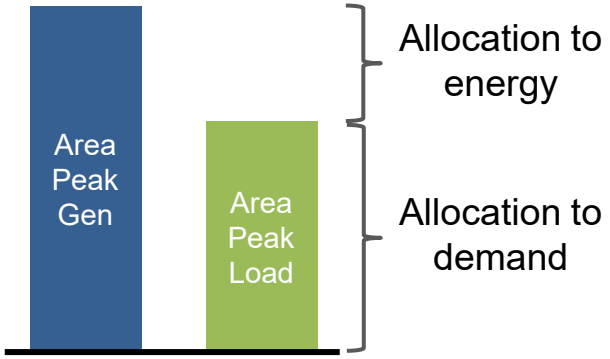
- **Minimum system**: Estimate of the transmission system required to meet peak load (demand)
- **Actual system**: Estimate of the additional transmission system required to facilitate the in-merit flow of energy
- Minimum and actual systems for Alberta are estimated as the sum of the minimum and actual systems across all planning areas
- Calculate the demand-share of costs based on the size of minimum and actual systems for Alberta

The resulting allocations for 2020 are 60 per cent demand and 40 per cent energy, and have changed minimally since 2015

Example of an area where peak gen < peak load



Example of an area where peak gen > peak load



Minimum system illustrative calculation

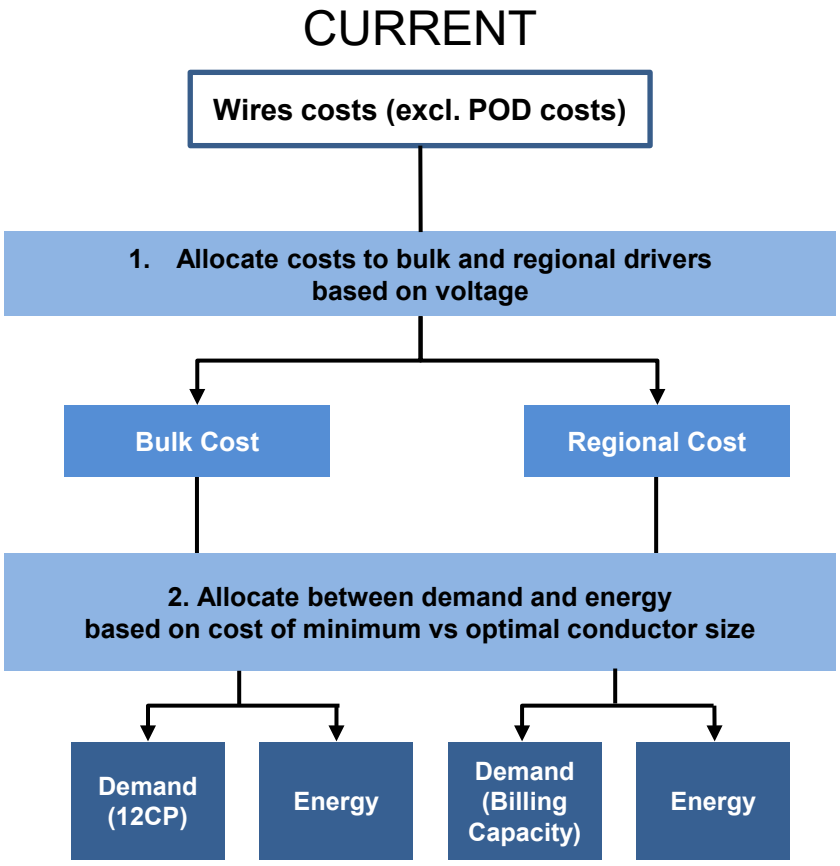
Area	Peak Load (MWh) (a)	Peak Gen (MWh) (b)	Min System (MWh) =(a)	Additional System (MWh) =(b) – (a) if (b) > (a), otherwise 0
1	100	0	100	0
2	100	100	100	0
3	100	150	100	50
4	0	100	0	100
5	20	10	20	0
Total			**320**	**150**

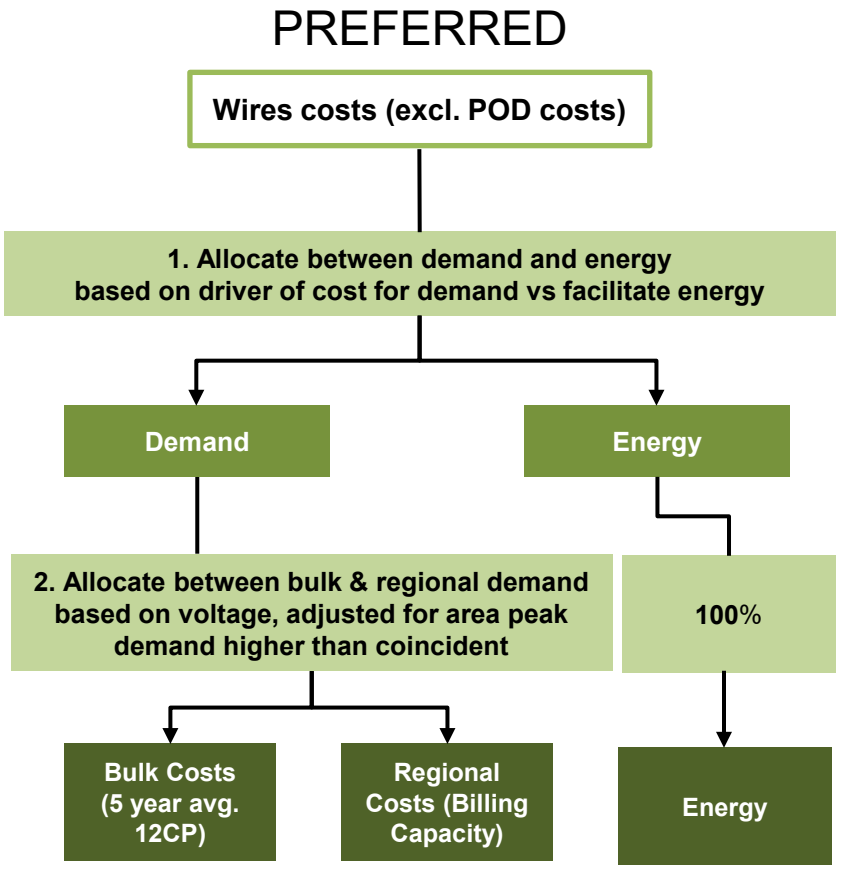
In this example the allocations across the whole province would be:

- Demand Allocation: 68% (320 / 470)
- Energy Allocation: 32% (150 / 470)

Allocations for the whole province are applied to the entirety of wires costs (excluding POD) to calculate rates that apply across the province

Current and preferred rate design





Current and preferred rate design

Type of charge	Cost Allocation (do not sum due to rounding)		Charges Estimated for 2019 test year	
	Current	Preferred	2019 Test Year	Preferred
Coincident Peak ($/MW month)	47%	29%	10,087	5,980
Energy* ($/MWh)	7%	31%	2.18	10.19
Billing Capacity ($/MW month)	22%	17%	2,668	2,055
POD (**out of scope**) ($/MW month)	24%	24%	N/A	
Total	**100%**	**100%**	**N/A**	

*Current energy charges are the sum of bulk and regional components

What We Heard from Session 5 Stakeholder Feedback

Public

Summary

- Today we want to focus on key areas of stakeholder feedback and questions we received that are important to address to provide additional clarity and build a better understanding of the preferred tariff design
- Many stakeholders expressed concerns with the preferred rate design, including:
  - Belief that charge on energy is not appropriate to recover fixed costs
    - Suggest further analysis required on: analyzing time varying charges or min/max load factor charge, self-supply risk
  - Questions about 5-year average on 12-CP charge, mitigation through rate design versus bill credits, appropriateness of DOS for mitigation, and general request for more details
- Many stakeholders referred to AUC staff questions and indicated that AESO responses may help them to better understand the preferred rate design

AUC staff questions

- On April 7, 2021, the AESO received a list of 58 questions in six categories from the AUC staff in relation to the anticipated application, on the following general topics:
  - Appropriateness of cost recovery on avoidable versus unavoidable charges
  - Historical data on transmission costs and load growth
  - Transmission cost recovery based on coincident peak, time varying energy charges or other dynamic charges
  - How we plan transmission for various types of loads (including energy storage)

Our response to stakeholder feedback

- Today we want to share information on the following topics that have been raised through AUC staff questions and stakeholder feedback
  1) Appropriateness of the flat energy charge
  2) Cost recovery through avoidable charges and efficiency
  3) Analysis of self-supply in response to the preferred rate design
  4) Analysis of the short-run impact of the preferred rate design on the energy market

1) Appropriateness of the Flat Energy Charge

Public

Concerns with proposed energy charge

- Stakeholders have commented on the following:
  - Concern that fixed costs recovered on variable charges is not aligned with cost causation and would send inefficient price signals (aligns with AUC staff questions)
  - Concern that the flat energy charge not consistent with time variation in use of transmission and would not send efficient price signals
    - Suggested improvement would be on-peak and off-peak charge
  - Concern that “penalizing” high load factor customers who use transmission efficiently not aligned with sending efficient price signals
    - Suggested improvement would be “Wright” tariff (min load factor/ max load factor) or declining block charges for energy
  - Concern about impacts on long-term response, incentives for self-supply / cost shifting (aligns with AUC staff questions)

Flat energy charge best reflects costs associated with in-merit energy

- There is no evidence for a cost reflective basis to recover costs associated with accommodating the flow of in-merit energy from a time of use energy charge
- The costs associated with accommodating the flow of in-merit energy are, by definition, not associated with changes in demand but with the use of energy
  - For example:
    - The costs of facilitating the flow of in-merit energy from wind generators are driven by times of windy conditions which may occur in any hour of the day.
    - Other flows of in-merit energy, i.e. from non-responsive baseload plant e.g. cogeneration or hydropower, may also occur in any hour of the day.

Responds to AUC staff question 5.4 and 5.5

Flat energy charge best reflects costs associated with in-merit energy

- There is no evidence for a cost reflective basis to vary the energy charge by customers' load factor
- A customer's decision to use energy in any hour means the AESO needs to accommodate the flow of in-merit energy to meet that load, irrespective of how that customer's use of energy in the hour compares to other times of the year

Responds to AUC staff question 5.4 and 5.5

Preferred rate design reflects costs and includes time of use charges

- The preferred rate design is made up of three charges, and recovers demand-related costs through time of use charges
- Given the relationship between system load and transmission load, the AESO's preferred rate design includes charges to reflect the costs of use at different times
  - A charge levied on 12-CP reflects costs incurred to meet consumption at times of coincident peak
  - A charge levied on billing capacity reflects investments required to meet specific customer demand at non-coincident peak
- The AESO's preferred rate design uses a flat energy charge to reflect the investments incurred to accommodate the flow of in-merit energy in all hours of the year under normal system operating conditions

Responds to AUC staff question 5.4 and 5.5

Questions?

Public

2) Cost Recovery Through Avoidable Charges and Efficiency

Public

Questions related to transmission cost recovery concepts

- Stakeholder feedback and AUC staff questions included several questions and comments related to:
  - Avoidable versus non-avoidable charges
  - Marginal cost approach to transmission pricing
  - Recovery of fixed costs through avoidable charges
  - Efficient and inefficient customer response
- We want to share some additional information in response to these themes and questions as they relate to some of the main aspects of the preferred rate design

Avoidable charges are relevant in a marginal approach to cost recovery

The concept of avoidable charges stems from a marginal cost approach

- A marginal cost approach to tariff design can send an efficient price signal levied on an avoidable charge, and uses a non-avoidable charge to recover the residual costs, provided the regulatory construct allows for locational pricing
- In the transmission context, a marginal cost approach to rate design should theoretically send an efficient price signal that reflects the costs imposed by incremental changes in demand on the system
  - This price signal should be sent through a charge which is “avoidable” or varies with customers’ consumption behavior

Responds to AUC staff question 1.1 to 1.3

Avoidable charges are relevant in a marginal approach to cost recovery (cont.)

The concept of avoidable charges stems from a marginal cost approach (cont.)

- The remaining costs would be recovered in a way that avoids distorting the consumption decisions that customers take in response to the efficient price signal
  - This price signal should be sent through a charge which is "non-avoidable" – or does not vary with customers' consumption behavior – to prevent distortion of their consumption decisions and to ensure total cost recovery

Responds to AUC staff question 1.1 to 1.3

The marginal cost of transmission varies by location

- Changes in customers' demands will have different impacts on transmission system costs depending on where they are located on the system
- In a distribution system, it is reasonable to assume that changes in customers' consumption decisions will have a similar effect on the distribution utility's costs, and that customers are served with similar types of infrastructure
- In a transmission system, by contrast, it is not safe to assume all customers' demands have the same impact on transmission system costs:
  - The AESO plans transmission capacity to move electricity from areas where the supply of in-merit energy exceeds demand, to areas where demand exceeds supply
  - Increasing demand in areas of surplus in-merit energy may therefore reduce transmission costs (implying a negative marginal cost); while
  - Increasing demand in areas where demand exceeds supply may increase transmission costs (implying a positive marginal cost)

Embedded cost methodology aligns costs with drivers

- In a transmission system *all charges are avoidable* (unlike in distribution system)
  - Transmission customers can and are expected to respond to transmission tariff charges
    - For example, by reducing demand at peak times, reducing overall energy use, or by reducing contract capacity (including grid defection)
    - How costs are allocated to different charges will incentivize different forms of response (or avoidance) to different degrees
- Embedded methodology aligns transmission cost drivers with transmission charges, so that response to charges occurs through the drivers that are aligned to costs
  - Variable charges that correspond to how costs have been incurred (based on how transmission system is used) align with the principle of cost causation

Recovery of fixed costs on variable charges is aligned with cost causation

- An embedded cost methodology signals to customers the long-run costs of providing transmission, reflecting whether costs were incurred historically to accommodate demand or accommodate the flow of in-merit energy
- Recovery of fixed transmission costs based on variable (or "avoidable") charges aligns with cost causation because an embedded cost methodology recovers the costs associated with the long-run drivers
  - Example: Recovering costs associated with accommodating the flow of in-merit energy through an "avoidable" energy charge reflects the long-run economic costs of energy purchased from the market

Responds to AUC question 1.5 a and d, 1.6 c and e

"Avoidance" of cost reflective tariff charges can be efficient

- Response to the preferred rate design (for example by "avoidance") will be efficient to the degree that the tariff is cost reflective
  - Preferred rate design improves on the current tariff by better signalling the long-run costs of providing transmission
    - For instance, explicitly recognizing the costs of providing transmission in order to accommodate the flow of in-merit energy
- If customers choose to "avoid" certain costs (for example by self-supply), it is not necessarily inefficient for the system
  - Efficient if the avoided system costs of serving that customers' self-supplied load from the grid exceed the costs incurred by the customer to self-supply over the long-run
  - There may be a possibility of inefficient self-supply decisions if the costs incurred historically are higher than the costs associated with meeting customers' demands for electricity in the future

Responds to AUC staff questions 3.2 and 3.3

"Avoidance" of cost reflective tariff charges can be efficient (cont.)

- The transmission tariff should encourage efficient self-supply decisions and discourage inefficient self-supply by customers by better signalling the costs associated with providing transmission
  - The Alberta market framework relies on wholesale market price and tariff to send signals of costs of taking energy to reach efficient outcomes

Responds to AUC staff questions 3.2 and 3.3

Break

Public

3) Analysis of Self-Supply in Response to the Preferred Rate Design

Public

Analysis of self-supply response

- Stakeholders have communicated a concern that the allocation of transmission costs under the AESO's preferred rate design creates additional opportunities for self-supply
- This section summarizes NERA's analysis of the maximum estimated customer response to the preferred rate design through self-supply, including:
  - Factors that influence self-supply decisions
  - Efficient and inefficient self-supply decisions
  - Estimates of self-supply response under preferred rate design
  - Consideration of future trends affecting self-supply decisions

For more details, see the NERA report posted on the AESO website at https://www.aeso.ca/assets/Uploads/AESO-customer-impact-report-05-25-2021.pdf

Summary

- Customer response to the preferred rate design through different self-supply decisions will improve efficiency because the preferred rate design is more cost reflective
  - Conservative estimate that self-supply could increase under the preferred rate design through a one-time adjustment of up to 2,801 GWh. This estimate is the total effect and includes dynamic responses by customers to self-supply decisions of other customers
  - This inclusive estimate reflects a shift in costs from self-supplying customers to other customers of a one time approximate 1.9 per cent of the 2019 bulk and regional costs
- Predicts an extremely limited increase in self-supply by industrial customers under the preferred rate design
  - Any change in customers' self-supply decisions that does arise will tend to result in more efficient patterns of electricity use than the current tariff
- Expect that the economics of self-supply will significantly worsen in the future due to increasing gas prices and carbon tax

Evaluating customer choice to self-supply

- From the customers' perspective, optimal decisions to self-supply balance the costs incurred to self-supply with the avoided costs of consuming power from the grid
  - Costs include generation costs, land costs, capital costs, etc
- Customers make a holistic decision of whether to self-supply based on all the benefits and avoided costs of procuring power from the grid (i.e., not just the transmission charges)
  - Avoided costs will depend on how customers use electricity and how charges are levied
- Given that self-generation decisions typically involve investment in long-lived generation assets, a customer's decision on whether to self-supply considers a forward-looking assessment of the costs of self-supply relative to the forward-looking avoided costs of consuming from the grid

Efficient and inefficient self-supply decisions

- It is not necessarily inefficient for the system if customers choose to self-supply
  - A customer's choice to self-supply may be efficient and lower the total overall costs of electricity supply as long as the tariff is cost reflective
    - A customer choosing to self-supply would **improve** efficiency if the avoided system costs of serving that customers' self-supplied load from the grid **exceed** the costs incurred by the customer to self-supply over the long-run
    - A customer choosing to self-supply would **reduce** efficiency if the avoided system costs of serving that customers' self-supplied load from the grid **are less than** the customer's incurred costs to self-supply over the long-run
- Customers rely on regulated transmission tariff and wholesale market prices to signal the total costs incurred to supply them with electricity

Efficiency of the response to a change in the tariff

- Customers may make different, and *more efficient*, self-supply decisions in response to a new tariff that is more reflective of the costs of transmission incurred to serve that customer's load
- The AESO's preferred rate design:
  - Reduces costs recovered through a charge on 12-CP in order to better meet principles of cost causation
  - Reduces the incentive for inefficient self-supply decisions taken based on current 12-CP transmission charges that exceed the costs associated with meeting coincident peaks in demand
- However, need to evaluate the remaining risk of inefficient self-supply decisions
  - Tariff recovers the current operating and historically incurred capital costs of the transmission system
  - If the costs incurred historically are higher than the costs associated with meeting customers' demands for electricity in the future, there is a risk that a tariff set to recover historical costs will cause customers to self-supply

Estimating future self-supply response

- The AESO's preferred rate design would change what customers pay for grid supplied electricity and their incentive to self-supply in different ways depending on how and when they draw power from the grid
  - Preferred rate design would recover more costs from energy-based charges than the current tariff
    - Transmission charges for customers with high load factors and high energy consumption would tend to increase
    - Customers who have previously avoided 12-CP hours could see a rise in charges since more costs are allocated to energy in all hours and fewer costs are allocated to 12-CP
    - Customers with lower load factors, or who consume at times of 12-CP tend to have lower charges

Changes in consumption in response to change in tariff

- Preferred rate design may lead customers to change how and when they use the grid:
  - Lower 12-CP charge may reduce customers' incentive to avoid consumption at times of coincident peak, increasing use at these times
  - Lower charge on contracted demand increases customers' incentive to hold contracted capacity (e.g., for backup), which reduces the incentive for grid defection
  - Increase in the energy charge may decrease customers' incentive to take energy from the grid across the year
- Overall response to changes is expected to vary based on customer attributes including load factor, flexibility, etc.
  - Response will tend to be more efficient (for the customer and for the system), because preferred rate design is more cost reflective than the current tariff

Estimating customer response to preferred rate design

- Analysis of how self-supply decisions may change for industrial sites after the introduction of the preferred rate design:
  - First, assess whether and to what extent it would be economic for industrial sites to self-supply rather than procure power from the grid across the year, considering both wholesale prices and transmission tariffs
  - Then, predict actual customer responses to the change in the incentive to self-supply under preferred rate design, based on statistical estimates of how likely customers have been in the past to self-supply
    - This step accounts for other costs customers face to self-supply that we cannot observe
  - Calculate new rates including reduction in billing determinants and repeat first step using new rates

Findings on self-supply response

- We predict an extremely limited increase in self-supply by industrial customers under preferred rate design, and any change in customers' self-supply decisions that does arise will tend to result in more efficient patterns of electricity use than under the current tariff
- Self-supply is estimated to increase through a one-time adjustment (including expected dynamic response) under the preferred rate design
  - **Up to** 2,801 GWh (4.7 per cent of 2019 energy billing determinant)
    - Equivalent to a total cost shift of approximately $30 million from self-supply customers to other customers (or 1.9 per cent of 2019 bulk and regional costs)
- Estimate of self-supply response is conservative
  - Assumes capacity will be installed today even though future costs of self-supply increase relative to costs from the market (future changes in carbon taxes and gas prices)

Questions?

Public

4) Analysis of the Short-Run Impact of the Preferred Rate Design on the Energy Market

Public

Introduction

- Loads can respond to tariff charges in the short-run and the long-run
  - Short-run: Loads increase or decrease their consumption using existing capability
  - Long-run: Investments in self-supply, energy efficiency, flexibility, etc.
- This analysis seeks to better understand how the **short-run** response of loads to the preferred rate design will impact the energy market
  - Address concern from stakeholders that allocation of transmission costs to energy charge will lead to distortions in the wholesale energy market
- Key findings:
  - **The changes in the preferred rate design are estimated to have a minimal impact on the energy market, and may even increase efficiency in the energy market**
    - Increase to the energy charge will lead to a small reduction in efficiency
    - Reduction in the CP charge can be expected to increase efficiency

Introduction (cont.)

- This analysis isolates the energy market and therefore does not measure the overall efficiency of the electric system
  - Improving transmission cost recovery to align with cost causation principles will lead to more efficient consumption decisions
  - Some energy market impact is inevitable, as consumers can respond to tariff charges in the long-run no matter how costs are collected
- When loads that would otherwise be consuming turn off due to tariff charges, this shows up as an inefficiency in the energy market, consisting of:
  - Lost benefit to the load
  - Lost profit to the generator

Introduction (cont.)

- This analysis estimates the change in energy market efficiency based on the following assumptions:
  - Approximate $9/MWh increase in the energy charge
  - Removal of the coincident peak (CP) charge
    - The AESO's preferred rate design does not remove the CP charge, but rather reduces it by about 40 per cent
    - Due to data limitations, the load response to this change cannot be accurately measured
      - *This will be discussed further*
- The AESO estimates the efficiency impact of these changes based on the response from price-responsive loads
  - Firm loads will not change their behaviour in the short-run and therefore will not impact efficiency in the energy market
- The model includes the years 2018 and 2019

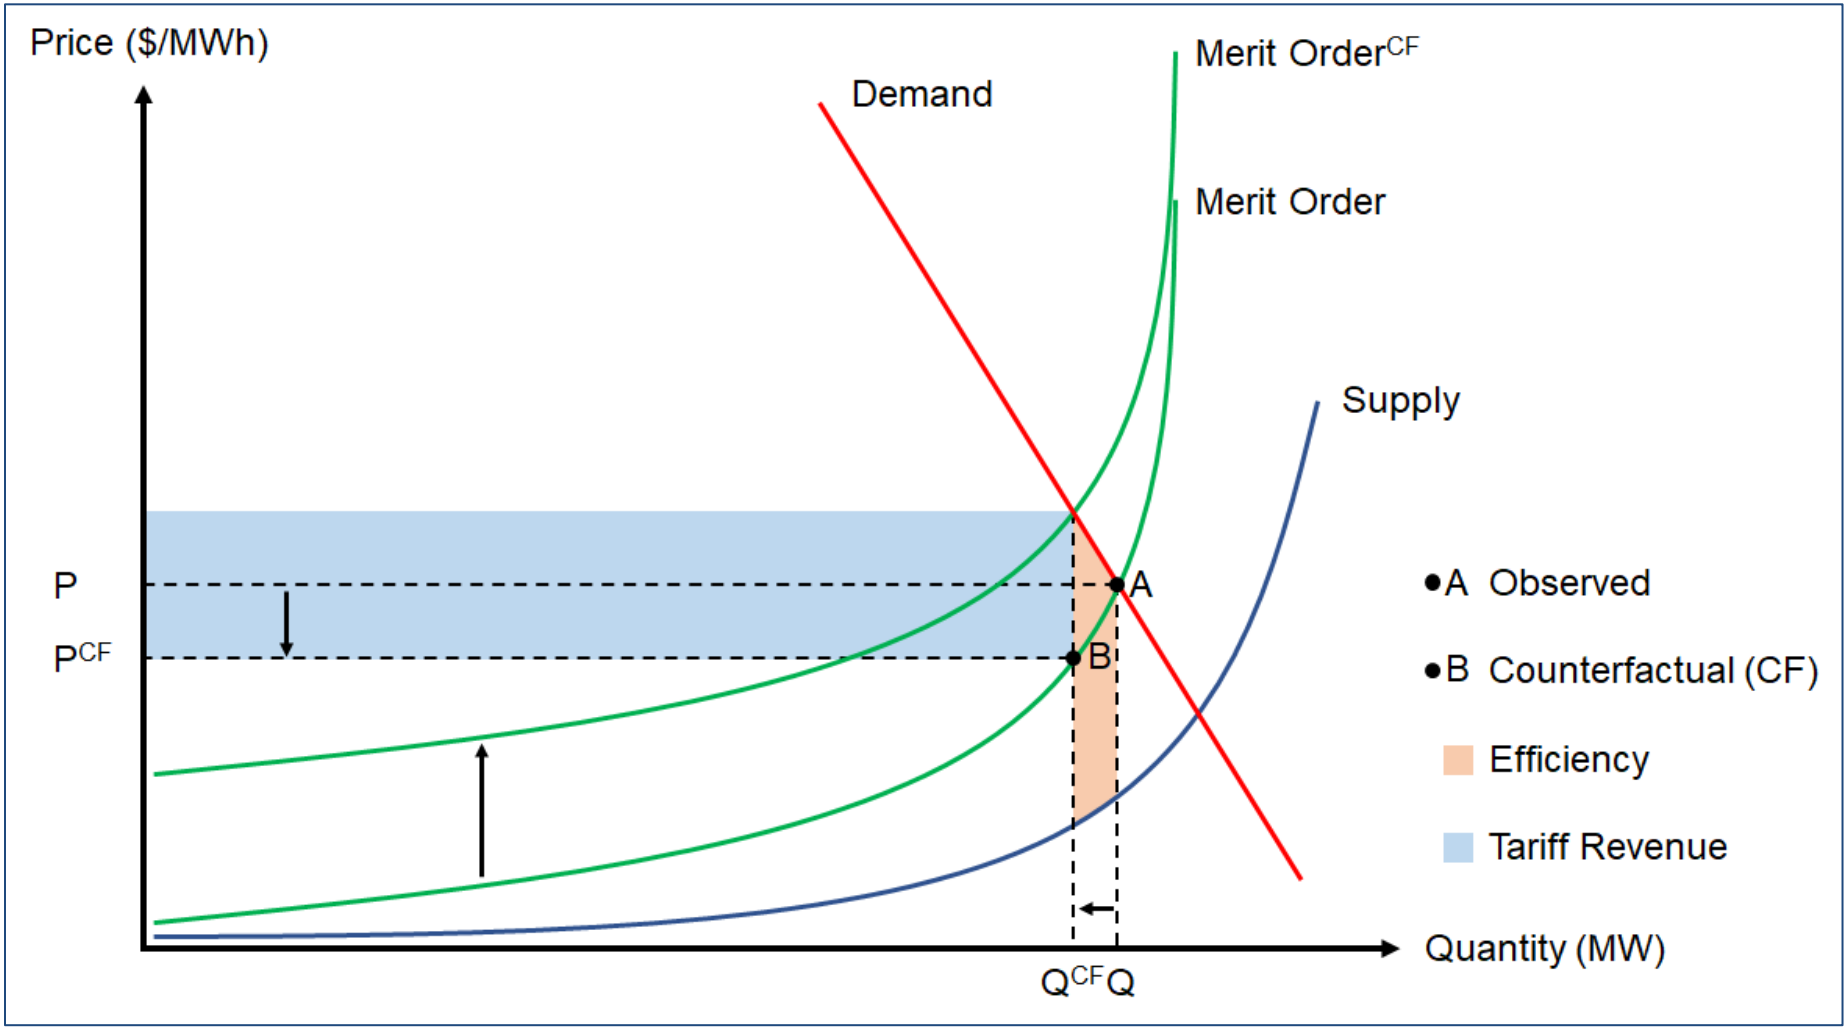
Energy Charge

Public

Method

- As a proxy for the increased energy charge, all offers to the energy market are increased by $9
  - This will increase the energy price by $9 for any given level of demand
- The response of loads to the higher energy price is estimated using historical data from eight sites identified as being price-responsive
  - In reality, loads may respond differently to tariff charges and the energy price due to hedging
- The new market equilibrium is estimated using the new, lower level of demand and the original merit order
- The efficiency loss is estimated based on the lost benefit to loads and generators on the reduced MW of demand

Illustrative example



Results

Year	Efficiency Change ($)
2018	(865,890)
2019	(1,279,615)

- A $9/MWh increase in the energy charge is estimated to create approximately $1 million in efficiency losses per year in the energy market
  - To the extent that loads are more responsive to tariff charges than to the energy price, the actual impact may be larger than this estimate

Coincident Peak Charge

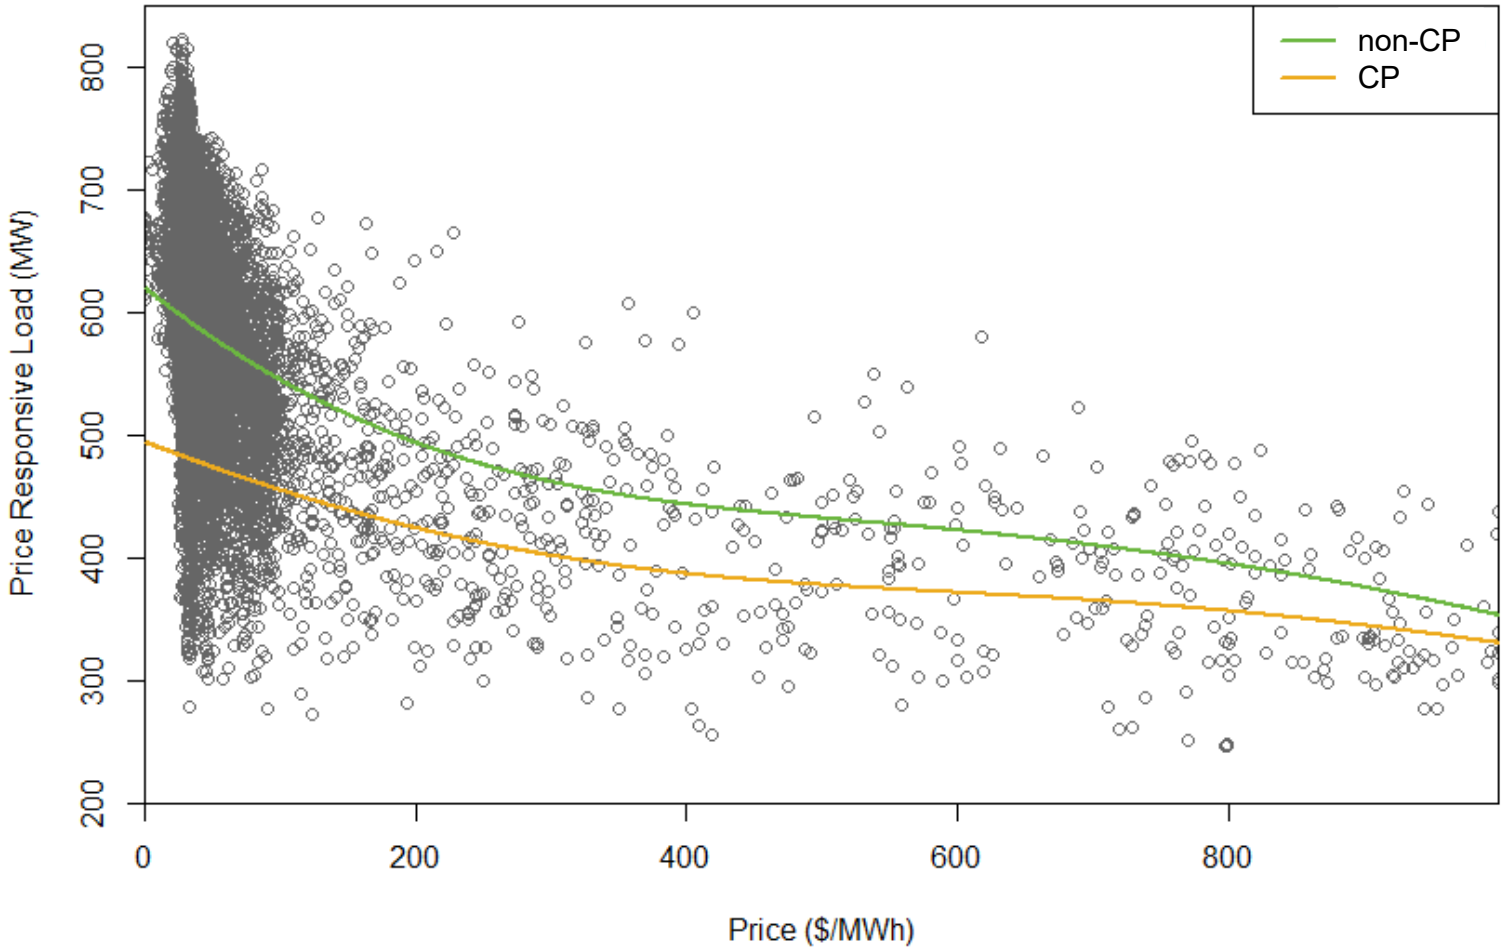
Public

Method

- Unlike the energy charge, changes to the CP charge are expected to impact the market in a small number of hours
  - Because the CP interval is uncertain until the end of the month, loads respond in multiple hours to avoid the charge
    - The day-ahead hourly demand forecast was used as an indicator of whether loads may choose to respond
    - Using a regression on load consumption data, the AESO found that 45 hours of response per month best explained the behaviour of loads
    - Twenty-eight sites were identified as responding with at least 1 MW of load on average during these 45 hours after controlling for responsiveness to price
- From these 28 sites, two demand curves were estimated using their consumption in the 45 CP-flagged hours compared to all other hours

Demand curve shift

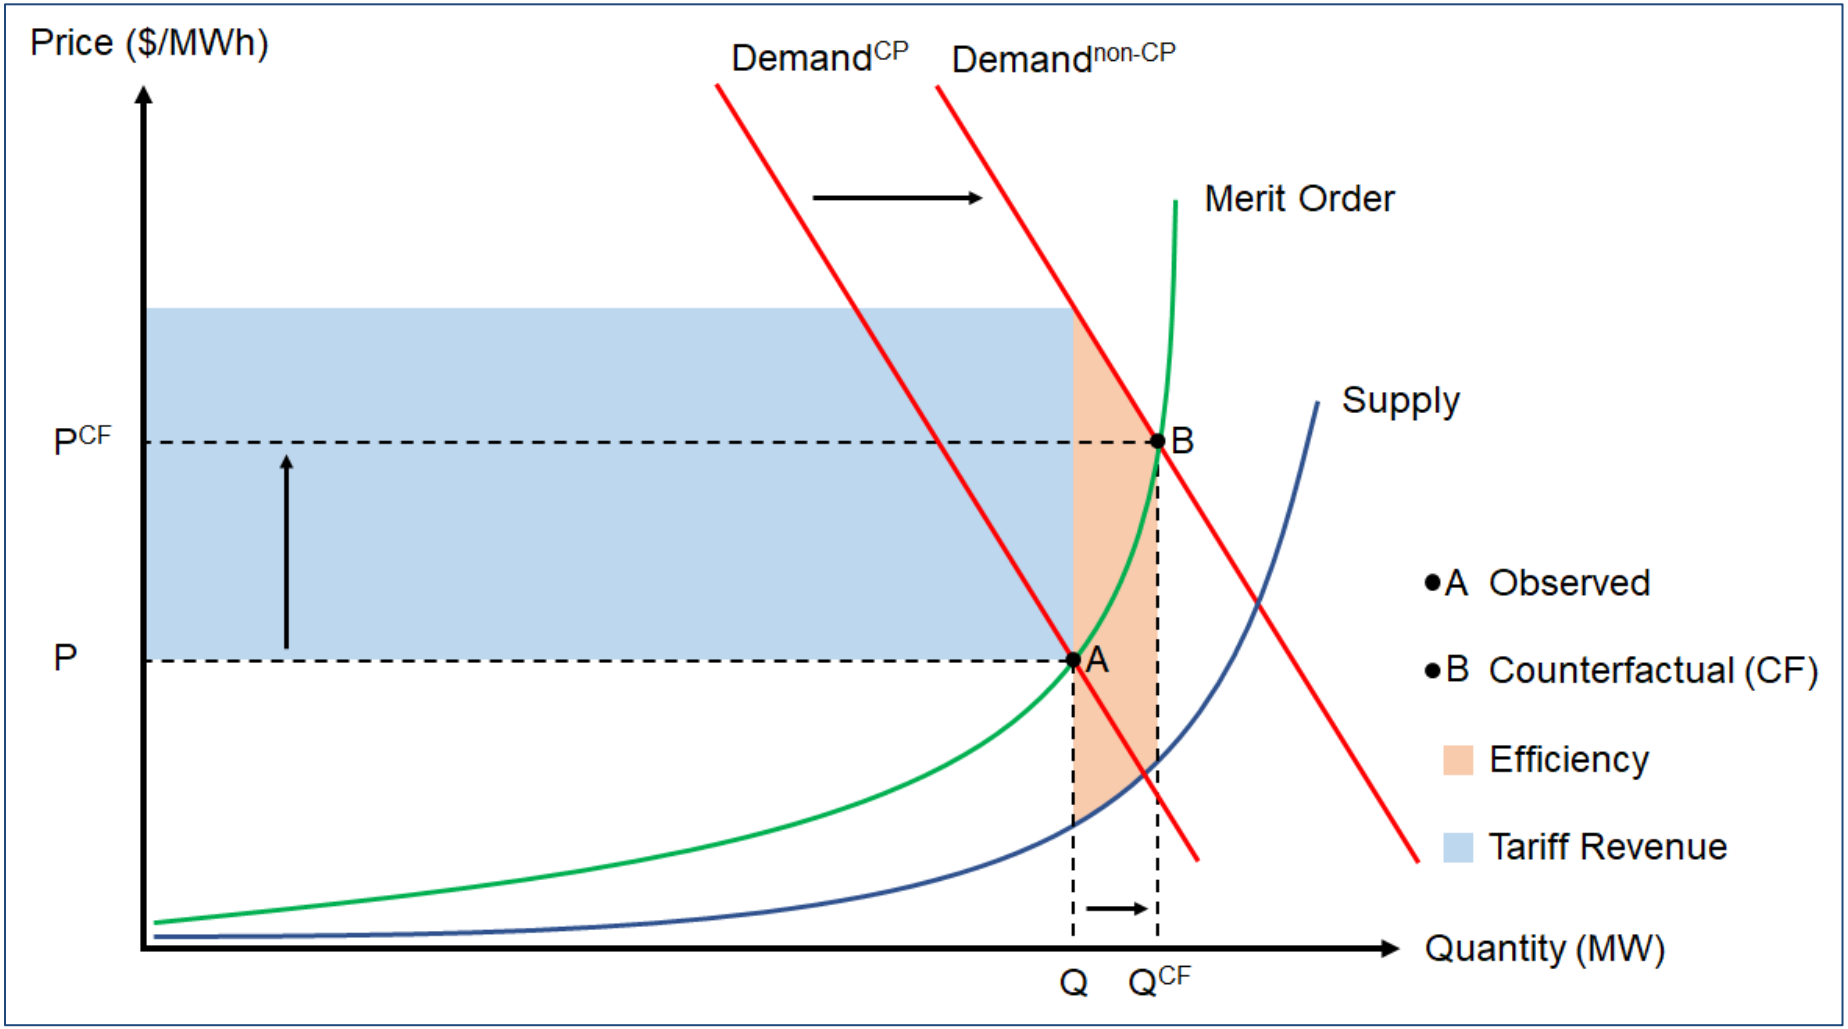
- The graph below shows the CP and non-CP demand curves, estimated using the method described in the previous slide



Method (cont.)

- The impact of removing the CP charge is determined by adjusting demand in CP-flagged hours to the level that would be expected in a non-CP hour
  - This estimates the efficiency gain from setting the charge to $0, not the level in the preferred rate design
    - The last time the CP charge was at ~$5,980/MW month as is the charge in the preferred rate design was in 2013-2015 which would not be reflective of how load responds today
- The new equilibrium is estimated using the new, higher level of demand and the merit order
- The efficiency gain is estimated using the recovered benefit to loads and generators on the MW of demand that respond to the CP charge

Illustrative example



Results

Year	Efficiency Change ($)
2018	9,548,063
2019	12,193,163

- Removing the CP charge would result in an estimated efficiency gain of ~$10 million per year in the energy market
- The impact of the preferred rate design will depend on how the response from loads changes compared to the status quo
  - Both the reduced charge and the change to a 5-year average billing determinant would reduce the incentive to respond, which would recover some lost efficiency

Findings

- The efficiency impact of the proposed energy charge is estimated to be minimal
  - Based on 2019 average system load of 7,030 MW, a $9/MWh increase in the energy charge is estimated to collect over $500 million in revenue with an efficiency loss of ~$1 million (0.002 per cent)
- The current CP charge is estimated to create inefficiencies that are an order of magnitude higher than the proposed energy charge
  - If loads consume more during coincident peak times in response to the preferred rate design, these inefficiencies would be reduced
- Even if the impact of the energy charge is not offset by the change to the CP charge, the preferred rate design will still be more efficient from the perspective of the overall system

Next Steps

Public

Engagement schedule

- **June 10, 2021 |** Stakeholder feedback due on questions set out in Stakeholder Comment Matrix Session 6A
- **June 24, 2021 |** Host stakeholder engagement session to discuss AESO's targeted mitigation discussion outcomes, Session 5B (DOS) and Session 6A stakeholder feedback, and areas of alignment
- **July 9, 2021 |** Stakeholder feedback due on questions set out in Stakeholder Comment Matrix Session 6B
- **October 2021 |** File application with AUC for public proceeding and approval

Session feedback

- We want to thank you for attending the Bulk and Regional Tariff Design Stakeholder Engagement Session 6A and we would appreciate your feedback on the session
- Launch Zoom poll
- We invite all interested stakeholders to provide their input on this session via the questions set out in the **Stakeholder Comment Matrix Session 6A on or before June 10, 2021**. The matrix will be available on May 27, 2021 on our website at www.aeso.ca
  - Path: Stakeholder Engagement > Rules, standards and tariff consultations > Tariff (filter) > Bulk and Regional Tariff Design > Session 6A | June 3, 2021

Next session

- Following Session 6A, the AESO will host Session 6B on **June 24, 2021.** Registration details will be available in early June on the AESO website at www.aeso.ca
- **Session 6B purpose**
  - The purpose of the session is to engage stakeholders in a discussion of the AESO's targeted mitigation discussion outcomes, Session 5B (DOS) and Session 6A stakeholder feedback, and areas of alignment
- **Session 6B objectives**
  - Provide an overview and seek stakeholder input on the outcomes of the targeted mitigation engagement
  - Share our learnings and seek stakeholder input on Session 5B (DOS) and Session 6A stakeholder feedback and areas of alignment
  - Present and discuss implementation considerations
  - Seek to understand outstanding stakeholder concerns

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021	through	June 10, 2021	**Contact:**	Company Representative
Comments From:	Company Name			**Phone:**	Contact Phone Number
Date:	[yyyy/mm/dd]			**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	
4.	How would you describe your level of support for the “allocation of costs to energy” element of the design?	
5.	How would you describe your level of support for the “flat energy charge” element of the design?	
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	
7.	Are there other elements of the design you support or have concerns with? Please be specific.	
8.	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021 through June 10, 2021	**Contact:**	Colette Chekerda
Comments From:	Alberta Direct Connect Consumers Association	**Phone:**	780-920-9399
Date:	2021/06/10	**Email**:	colette@carmal.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	The ADC did not find the session particularly valuable as the AESO continues to rely on high level power point presentations to support their proposal and has provided no transparency to any studies, data or analysis to support the preferred tariff design. The message has been "trust us" without regard for the consequences on the Alberta economy. The ADC remains unconvinced that the AESO preferred tariff design provides a fair or efficient price signal. The impact to the Alberta economy and particulary to the manufacturing sector will have consequences to long term investment and jobs.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	The study makes no mention of reasons why customers have been reluctant to self supply in the last few years. I.e. Policy uncertainty around capacity market, self – supply and export, and metering practices.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	e. not supportive The proposed tariff design is signalling a grid exit for high load factor customers. This exit could be a move to self generation or exit from the province. Further the AUC just ruled that DCG credits are to be phased out over the next 4 years, so one of the key reasons for the case for change no longer exists.
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	Not supportive
5.	How would you describe your level of support for the "flat energy charge" element of the design?	Not supportive
6.	How would you describe your level of support for the "5-year average of 12-CP" element of the design?	Not supportive – the AESO already has a 5 year notice period for changes to DTS contract capacity, the 5 year 12 CP ratchet is unnecessarily complex and will be another barrier for distribution companies to adopt tariffs that can align with the transmission tariff.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	The ADC has previously commented on the elements of the design we have concerns with. Those concerns remain unaddressed, in particular the demand energy classification. The AESO could have taken an approach where they held the CP charge at current levels and introduced a higher energy charge over time or considered alternative rates.

8.	Additional comments	The ADC requests the AESO provide their detailed analysis and data supporting the demand / energy classification to provide transparency and sufficient time for interveners to review and understand the materials. The AESO has this data available as they relied on it for the tariff proposal. There is no reason not to make this available as soon as possible. Further, the ADC wishes to highlight a commission ruling on alternative rate classes and requests the AESO reconsider it's position on examining alternate rate classes (beyond DOS) for different operational requirements for interruptible, standby, and storage customers. **Extract from EUB Decision 2007-106** Page 7&8, pdf 12&13 In a number of instances, the AESO argued[12] that it would consider it inappropriate to permit variations in rates based on operational considerations such as voltage level because operational considerations may, to an extent, reflect the location of the customer. As a result, such variations may violate subsection 30(3) of the *Electric Utilities Act* (EUA). Subsection 30(3) of the EUA provides: 30 (3) The rates set out in the tariff (a) shall not be different for owners of electric distribution systems, customers who are industrial systems or a person who has made an arrangement under section 101(2) as a result of the location of those systems or persons on the transmission system, and (b) are not unjust or unreasonable simply because they comply with clause (a). In its reply argument, the ADC submitted that the AESO's interpretation of subsection 30(3) of the EUA was too broad. The ADC submitted that this provision does not prohibit recognition in

		the AESO's tariff of engineering or physical differences that may cause increased costs but which are not specifically tied to location.[13] The Board agrees with the interpretation presented by the ADC. **In the Board's view, recognizing different operational circumstances and their cost implications does not, in itself, contravene subsection 30(3) of the EUA. That section requires only that the rates not vary as a result of the location of their systems on the transmission system (i.e. the geographic location of the POD within the province). This is consistent with the Board's finding in Decision 2001-6.[14] The Board is in no way commenting on whether the AESO may have justifiable reasons, separate and apart from subsection 30(3), for extending system access service to all customers regardless of their actual physical system facilities. This specific legislative provision simply does not prohibit variations in rates based on operational considerations.**

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021 through June 10, 2021	**Contact:**	Hao Liu / Rob Senko
Comments From:	AltaLink Management Ltd.	**Phone:**	403-710-1247 / 403-874-6762
Date:	[2021/06/10]	**Email**:	Hao.liu@altalink.ca / rob.senko@altalink.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	(i) Somewhat valuable The session allowed parties to express concerns with the newly-released Nera study on self-supply. (ii) The March 25 session was sufficient to explain the AESOs preferred rate design
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: (i) Response to incentives under the preferred rate design (e.g., assessment of self-supply response) (ii) Impact on wholesale energy market	(i) No additional questions at this time. (ii) No additional questions at this time..

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	e) Not supportive. AltaLink is still not convinced that the proposed rate design will stop the increase in bypass of transmission costs or the cost shifting that has been occurring under the AESO's existing rate structure. In fact, under the proposed AESO rate design AltaLink believes the cost bypass issue will only get worse. See AltaLink's rationale set out in the comment matrix in response to the AESO's March 25, 2021 stakeholder session. As well, AltaLink agrees with the stakeholder comments at the AESO's June 3, 2021 meeting concerning NERA's report on Customers Response to the AESO's Recommended Bulk and Regional Tariff Design. In AltaLink's opinion, this report does not truly reflect the amount of future cost bypass that will occur if the AESO's recommended design is approved by the Commission.
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	Not supportive. See above.
5.	How would you describe your level of support for the "flat energy charge" element of the design?	Not supportive. See above.
6.	How would you describe your level of support for the "5-year average of 12-CP" element of the design?	Not supportive. See above.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	See above.
8.	Additional comments	None.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021	through	June 10, 2021	**Contact:**	Rick Cowburn
Comments From:	CWSAA / VIDYA			**Phone:**	(403) 397-8785
Date:	2021-06-10			**Email**:	rcowburn@vidya.ca

Instructions:

2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	Thanks, the AESO is clearly working hard to consult with stakeholders. The session was useful, and the recording was most helpful to review details of discussions.

2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	The proposal to allocate costs based on generation & load's use of the system merits deeper reflection. If the generation fuel source was available everywhere, then generation would always be located in close proximity to the load it serves. ENMAX's Shepard plant is an excellent example – virtually no transmission was required. The only requirement for transmission would be in the event of outages, or where the economics of generation technologies favoured it (e.g. the original Calgary-Edmonton transmission line in the 1930's, when "Calgary Power sold electricity to Edmonton during the summer, and EWdmonton sold surplus power to Calgary power during the low-water season." Candles to Kilowatts, p.29). Generation's energy source is the primary driver of generation location. Hydro-electric generation has to be where the dam is. Similarly, it is far cheaper to transport electricity than it is to transport thermal coal, so coal-fired power plants were located at the coal fields and transmission was built to reduce the total cost of electricity. Wind and solar resources are more widely distributed, but the same logic holds – transmission is built to enable optimal generation resource location. If local generation exceeds local load, it is because generation developers have identified an attractive local energy source. Under current legislation, generation has no material incentive to minimize the resulting transmission build, and local load is thus completely irrelevant to generators' location decisions. If transmission is required, it is there to facilitate access to attractive energy resources, which could be seen as supporting an allocation of all transmission costs to energy. The converse situation, where local load exceeds local generation, would arise where there are few attractive local energy resources. One could argue that incoming transmission capacity is needed only for that 'excess' portion of the load that is above local generation. However local generation does not trigger any bulk or regional transmission requirements, thus the level of local generation seems irrelevant to cost allocation. Are we really capturing the overall system's characteristics by taking all these local area data points and summing them up? We have a calculation – but is it physically meaningful? How could we demonstrate that it is – or is not? If this is a scientific hypothesis, it has to be possible to prove it false. (see Popper – The Logic of Scientific Discovery) There is a second factor driving transmission capacity, namely flexible generation dispatch. In the old monopoly generation world, unit dispatch could be optimized to follow a clearly defined response pattern that considered both generation and transmission economics. But in the new competitive electric market, unit dispatch follows 'deals' between parties, and as a matter of policy all possible 'deals' have to be facilitated by transmission assets. (T Reg §42) In principle, one could construct a hypothetical transmission system that is optimized based on central control of generation, and compare it to the current system. Any such hypothetical analysis would be open to endless challenge, though the principles may be sound. And then there is the reality that much of the current bulk system was created by legislative fiat, driven by neither demand nor energy. The search for cost causation hits a wall…

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Somewhat supportive of some elements. (see below)
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	Regulators and utilities have been debating demand / energy cost allocation for well over a century, and there is still no 'standard' consensus approach. The observatiions at point 2 above are intended to question the assumption that area peak generation and load can be directly linked to demand and energy allocators. While the proposed fundamentals-based approach appears generally sound, it is not clear how the proposed allocation is grounded in physical reality.
5.	How would you describe your level of support for the "flat energy charge" element of the design?	A review of NIDs will demonstrate that responding to outage contingencies and unusual generation dispatch patterns is the immediate driver of many transmission projects. Ratemaking focuses on peak loads for cost allocation because that's who pays the bills and the data is easy to come by – but transmission system stress and the need for reinforcement is not rigidly correlated with peak loads. Accordingly, non-time differentiated energy charges appear appropriate. The old equation "Fixed = Demand, Variable = Energy" has a pleasing simplicity that is unfounded in fact. The reality is more complex – for example, ratcheted demand charges seem to encourage peak demand reduction, but in practice long-term ratchets discourage peak reduction throughout the ratchet period by locking in a usage-independent bill. "We're already paying for it, we might as well use it…" The unratcheted 12-CP approach is in this regard similar to the energy charge – by more closely linking usage with billing, they encourage parties to 'get off the system' when they're not using it.

6.	How would you describe your level of support for the "5-year average of 12-CP" element of the design?	The 12-CP element of the rate design was never expected or intended to become the cost-avoidance tool it has evolved into. ("Clearly it is not possible for a customer to generally simply turn the power off and completely avoid the hour of system peak…" EUB Decision 2007-106, p.34) It should be removed from the tariff entirely, rather than fossilized for the forseeable future. And on this matter, views are entirely polarized into those who benefit from 12-CP and those who pay the resulting bills.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	It appears unlikely that there will be an agreement on rate impact mitigation. The AUC's recent DCG Decision 26090 provides a reasonable approach to major rate transition – a five year, graduated phase-in. The calculation details in this case are not trivial, since one would have to establish a 'base tariff' against which to calculate benefits, and determine the volumes to which the two tariffs would apply in order to calculate the mitigation payment; but the approach seems balanced and fair.
8.	Additional comments	Best wishes – this will be a controversial proceeding!

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021	through	June 10, 2021	**Contact:**	Matthew Davis
Comments From:	Capital Power			**Phone:**	403.540.6087
Date:	2021/06/10			**Email**:	mdavis@capitalpower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	Capital Power appreciates the opportunity to provide comments on the June 3, 2021 stakeholder session. While the session was valuable in that it provided a forum for stakeholders to ask questions about the preferred rate design, it appeared that many questions either remained unanswered or the answers provided were not sufficient in explanation. As a result, Capital Power did not come out of the session with a materially improved understanding of the AESO's preferred rate design. Capital Power believes that further anaylsis should be undertaken to determine the portion of costs allocated to demand and energy and the overall impact of the preferred rate design on customers. However, this additional analysis will only be effective if the AESO takes into consideration the concerns and recommendations voiced by stakeholders in the June 3rd session.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas:	Capital Power remains concerned that the AESO's preferred rate design and underlying analysis fails to accurately depict customer response to the incentives that will be created by the tariff. For

	Questions	Stakeholder Comments
	i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	example, in the AESO's analysis of self-supply response there was no consideration given to cogeneration or renewables, only simple and combined cycle. The narrow generation mix focused on by the AESO is not reflective of Alberta's current or future state. At minimum, the AESO needs to expand its assessment of self-supply response to consider the impacts of the tariff for cogeneration investment. In addition, the AESO did not consider that customers in Alberta have invested in generation and technology in response to the signal that 12-CP provides and that these sunk costs combined with the AESO's preferred rate design will further incentivize self-supply and grid defection. Capital Power's question at the session regarding how the AESO's analysis on the impact to wholesale energy market efficiency would change when considering how sunk investments would alter their behaviour remains un-answered. It is highly likely that the 12-CP response would continue, and further, those that have invested in capacity on-site to avoid 12-CP periods would now be more likely to run that capacity in more hours due to the increased energy charge. The AESO's efficiency analysis does not consider these incentives in developing their conculsions,.and is incomplete in this key respect. In the AESO's findings on the response of self-supply to the AESO's preferred rate design, it was estimated that the initial response will be an increase of up to 2,801 GWh of self-supply, or equivalent to a total cost shift of approximately $30 million per year from self-supply customers to other customers. This is concerning because: 1. The AESO did not consider cogeneration or renewables in the self-supply analysis; and 2. This equates to about a 400 MW reduction in load served by the transmission system and market, which is not immaterial, particularly given current expectations for little to no load growth. Capital Power is concerned that not only did the AESO miss a significant portion of self-supply customers in their analysis, but that the AESO considers this magnitude of self-supply immaterial.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Please see Capital Power's response to AESO session 5 materials.
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	Please see Capital Power's response to AESO session 5 materials.
5.	How would you describe your level of support for the "flat energy charge" element of the design?	Please see Capital Power's response to AESO session 5 materials.
6.	How would you describe your level of support for the "5-year average of 12-CP" element of the design?	Please see Capital Power's response to AESO session 5 materials.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	Please see Capital Power's response to AESO session 5 materials.
8.	Additional comments	Capital Power does not have any additional comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021	through	June 10, 2021	**Contact:**	Blair Wood
Comments From:	Conoco			**Phone:**	403-532-3575
Date:	2021/06/10			**Email**:	Blair.wood@conocophillips.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	The session was valuable, and the AESO offered a clear explanation of the components of its preferred rate design.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	During the session, concerns were raised about the comparative economics and incentives of the preferred rate design. Conoco shares those concerns. The NERA study states that "We find that moving from the current to the recommended tariff marginally increases optimal self-supply for customers in our sample by 814 GWh and 1,214 GWh in 2018 and 2019 respectively" (para 164). In other words, the proposed design increases the incentive to self-supply as compared to the existing tariff, according to the NERA study. Therefore, an outstanding question for the AESO is whether their preferred rate design is aligned with the original goal of decreasing the incentive to self-supply. If there are other goals, such as the potential for unquantified long run gains in economic efficiency, how has the AESO chosen to weigh those goals against each other? How are these goals balanced considering the likely short term increase in tariff costs to the remaining market participants because of the preferred rate design? It would be helpful to Conoco, all other participants, and eventually the Commission, to have access to the AESO's reasoning in response to the above questions and the underlying data/information.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Conoco is not supportive overall since it increases costs to high load factor customers which should be the customer group that the AESO would want to retain.
4.	How would you describe your level of support for the “allocation of costs to energy” element of the design?	Conoco is not supportive of allocating to energy. Transmission is built in substantial chunks, and typically built for capacity. Therefore, it is more appropriate to allocate these costs on a non-ratcheted NCP basis.
5.	How would you describe your level of support for the “flat energy charge” element of the design?	Conoco is not supportive of the flat energy charge, as it causes a distortion that is primarily of benefit to low load factor customers.
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	Conoco is still evaluating this design element.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	NA
8.	Additional comments	The AESO has not adequately supported the reasoning behind its preferred design. In particular, the AESO has not explained how its preferred design will respond to immediate concerns about the incentives to self-supply and the resulting impact on the remaining market participants.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021	through	June 10, 2021	**Contact:**	Raj Retnanandan
Comments From:	CCA			**Phone:**	Contact Phone Number
Date:	June 10, 2021			**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	i) Parties have expressed concerns over the preferred rate design in previous comment matrices and in submissions to the Commission. The explanations and rationalizations provided at this meeting served primarily to justify the AESO's preferred rate design. The AESO could establish a process to follow up on the continuing concerns of stakeholders. ii) In view of i) above, providing further clarity on the preferred rate design was not helpful from CCA's perspective.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	A number of questions and concerns were raised during the sessions on the assumptions used in the study.
	Questions	**Stakeholder Comments**
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	See below

4.	How would you describe your level of support for the “allocation of costs to energy” element of the design?	Not supportive. Classifying those area facilities costs, where peak generation exceeds peak demand, to energy, could be appropriate if the energy price signals were being provided directly to generators on a location basis; this is not permitted by legislation. However, providing energy price signals to load based on costs that arise from generation, would have the effect of discouraging energy use from the grid and encouraging self generation. This could create a viscious circle where increases in self generation and export, could be followed by further increases in the proportion of transmission costs classified as energy related, followed by further increases in the energy price. At a time when self supply on the part of load customers of all types is increasing, the value of grid connection to such customers gains greater importance, while the value of energy supplied from the grid decreases. The value of grid connection to self supply customers includes: i) balancing of supply and demand flows through exchanges with the grid; ii) ability to maximize value of exports; iii) access to back up power; iv) frequency and voltage control services received from the grid or provided to the grid and v) system stability arising from grid connection. In addition to the grid connection, the capacity that is in place to meet the demand requirements of self supply customers is also an important value consideration. In view of these value considerations (i.e. connection and capacity), CCA believes further thought ought to be given to classifying that portion of costs considered as energy related by virtue of area peak generation exceeding peak load, as demand related and recovered on the basis of customer NCP demand (non ratcheted). Use of customer NCP demand (non ratcheted) would better reflect recovery of the fixed capacity costs associated with grid connections and provide a more effective price signal to load with self generation based on the value of grid connection.

5.	How would you describe your level of support for the “flat energy charge” element of the design?	Not supportive. In CCA’s view, as the proportion of self supply customers increases over time, a significant energy charge, whether time differentiated or not, could lead to lower and lower amounts of energy being taken from the grid. Since, a large proportion of transmission costs are fixed, reducing the offtake of energy from the grid by self generation customers means, those costs would then need to be recovered from other customers. This could lead to inequities between customers with self generation and other customers.
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	In CCA’s view the 5 year average CP demand approach using a single hour in each month, for recovery of a portion of bulk system costs, neither reflects cost causation nor does it provide efficient price signals for customers to reduce consumption during any other peak hour that has a high probability of giving rise to future plant additions. However, if the CP hours were based on a group of peak period hours in each month, with a high probability of driving system additions (example: hours with 90% probability of driving system additions) that would result in better alignment between cost causation and price signals as opposed to using historical average CP hours as proposed by the AESO.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	The items discussd above reflect the major concerns that need to be addressed.

8.	Additional comments	CCA recognizes the difficult task of designing AESO tariffs when the overall AESO revenue requirement (wires and ancillary services) remains relatively high. As a result of a relatively high revenue requirement, the resulting tariffs are likely higher than the avoided cost of self supply for many customers. [AESO Delivered Cost of Electricity Report May 2020] The AESO has statutory responsibility for planning TFO wires, distribution driven transmission facilities and ancillary services. Although there have been initiatives on the part of the AESO to coordinate planning efforts with DFOs, the overall planning approach of the AESO remains rooted in the one way energy flow, siloed utility planning model with little regard to optimization of overall costs to customers. However, the industry is in transition with two way (or multiple) flows of electricity whereby distributed and other resources are increasingly able to provide value to the system and consequently help reduce system costs. In CCA's view this value is not being tapped under the AESO's current regulatory policies for system planning. In the absence of appropriate regulatory policies, harnessing the potential value that DCG, TCG, DER and Demand Response could offer for the benefit of the system remains elusive, although enabling conditions, such as cloud computing and other digital technologies are available. In order to reduce some of the cost pressures arising from an increasing AESO revenue requirement, there is merit in reviewing the AESO's planning approaches in the context of the upcoming AESO GTA Phase I proceeding in order to achieve overall optimization of wires and ancillary services costs.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	
5.	How would you describe your level of support for the "flat energy charge" element of the design?	

6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	The following comments were submitted by the DCG Consortium in its April 15, 2021 comment matrix in response to Session 5: **<u>The implication of a five-year average 12CP reduction on DCG Credits</u>** It is unclear if the AESO has thoroughly considered the implications of using a five-year average of 12CP in calculating DCG Credits. It is further unclear how a DFO would perform these calculations. In the consultation session, it was explained that the use of a five-year average 12CP response does not change the total savings, but does smooth them over five years, i.e., response to a 12CP hour in January will result in savings spread over the following five January bills. DCG Credits cannot ignore this fact. When a DCG generates under this five-year average approach, it will cause bill savings in that month’s bill and also four additional monthly bills over the next five years. The DCG Credits cannot continue to be calculated in their current form, which consider only the impacts to that specific month’s bill. A DCG needs to continue to be compensated for all of the savings it generates, which will occur over time under the AESO’s proposal. (Please note that this comment is based on the fact that the current DCG Credits are based on the bulk and regional tariff and noting that Decision 26090 has not yet been released. However, even in the event that DCG Credits change as the result of that decision, a grandfathering or transitional period may continue to exist and DCG Credits should not be artificially decreased over a transition period based on this five-year average calculation.) **<u>Transition to a five-year average</u>** The AESO should further consider that the transitional period to the use of a five-year average will place increased importance on the ability to avoid a 12CP charge in the first few years of the new rate design. In the first year, the January 12CP charge will be based 100% on consumption during that time period. In the second year, the January 12CP avoidance from the first year will count for 50% and the January 12CP avoidance from the second year will count for 50%. In this way, while the steady state use of a five-year average will have each month count for 20% of a charge five times (20% x 5 = 100%), the months in the first year will be weighted much higher (100% + 50% + 33% + 25% + 20% = 228%). As a result, failure to respond to a 12CP hour in the first year of this new rate design will have much more significant financial impacts than failure to respond to a 12CP hour in later years. The AESO may wish to consider a different transition mechanism under which the first year is not so strongly weighted. One such option would be to fix the value of previous years at 20% from the beginning, i.e., in year 1, year 1 is 100% but in year 2, instead of 50%/50%, year 1 can be worth 20% and year 2 can be worth 80%. This would lower the value of year 1 from 228% to 180%.

Any reduction in the first-year weight would help to lower the cost and risk of failure to avoid all net imports during a 12CP hour in the first year.

The DCG Consortium notes that these issues were not raised or responded to in Session 6A. The impact of the five-year average on DCG Credits is a significant concern to the DCG Consortium. The DCG Credits will be significantly reduced for many DCGs with the implementation of the adjusted metering practice. DCG Credits can further be expected to fall with the reduction in the 12CP rate as a result of this application. DCG Credits should not be further arbitrarily reduced by 80% due to the use of a five-year average.

While the calculation methodology of the DCG Credits is the responsibility of the DFOs, the AESO cannot ignore this important implication in the development of its application.

As per the recently released Decision 26090-D01-2021, DCG Credits will be reduced through a transitional period between January 2022 and January 2026 in accordance with the following table.

Year	First day when the multiplier will be applied	Multiplier
1	Jan 1, 2022	0.8
2	Jan 1, 2023	0.6
3	Jan 1, 2024	0.4
4	Jan 1, 2025	0.2
5	Jan 1, 2026	0

However, in addition to these reductions, most DCGs will also be subject to a future reduction in DCG Credits due to the implementation of the AESO's adjusted metering practice.

The Commission has approved both of these forms of DCG Credit reductions. The Commission has not approved a further reduction in DCG Credits as a result of the use of the 5-year average 12CP charge that would impact DCG Credits in a different way from the impact of load rates, i.e. the DCG Consortium accepts that DCG Credits may change in value as a result of the next ISO tariff rates (expected to go into effect in 2023 or 2024), but the DCG Consortium does not agree that a further reduction as a result of the use of the 5-year average 12CP charge is appropriate.

The AESO should not decrease these multipliers beyond what was approved by the Commission through the application of its 5-year average 12CP charge. This needs to be appropriately accounted for the in calculation of DCG Credits.

Assuming the ISO tariff goes into effect on Jan1, 2023, if this is not appropriately accounted for in the DCG Credit calculation, then in 2024 DCG Credits will be subject to a 0.2 multiplier (0.4 as approved by the Commission further reduced by 0.5 due to the use of the 12CP average) and further to 0.066 in 2025 (0.2 as approved by the Commission further reduced by 0.33 due to the use of the 12CP average). This would go against the multipliers approved by the Commission.

		This problem can be solved simply as long as the DFOs are accurately accounting for the impact of a DCG's generation during 12CP, noting that it will impact not only that month's invoice but also invoices for the following 4 years. This could be resolved through continuing to provide the DCG Credit associated with the 12CP reduction in the year of the action and the five years following (i.e. generation in 2024 would result in DCG Credits paid in 2024-2028) or through paying DCG Credits in that month assuming a 100% impact to the 12CP charge, rather than a partial impact in this year and a partial impact in future years. However this issue is resolved, it must be resolved. The DCG Consortium urges the AESO to consider this issue and include language in its 2021 ISO tariff filing with the Commission in October in order to provide for an understanding of how this 5-year average is designed to flow through to DCG Credits in order to provide investor certainty and clarity through this transitional period.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	
8.	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021	through	June 10, 2021	**Contact:**	Dale Hildebrand
Comments From:	Dual Use Customers			**Phone:**	403-869-6200
Date:	2021/06/10			**Email**:	dale.hildebrand@desirataenergy.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	(i) We found the first two sections of the session to be repetitive and of limited value. The DUC would like to review the proposed cost of service study and proposed allocation of costs to energy methodology in detail once the AESO makes this information available. (ii) No.

2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	i. As discussed during the session, the DUC submits that the Estimating Customer Response to Our Recommended Bulk and Regional Tariff Design report dated 25 May 2021 does not appropriately analyze the potential threat of load defections from the AESO's proposed B&R tariff design. We submit that the significant and real threat of load defections predicated by the AESO proposed B&R tariff design will be large high load factor industrial customers and price responsive industrial loads who will experience large rate increases. We submit that the potential for customers to self-supply using simple cycle gas fired generation, as assumed in the NERA report, will be minimal. The self-supply response analysis had very limiting assumptions and ignored alternative self-supply technologies. It further ignored the fundamental question as to what level of self-supply should be incentivized via the AESO tariff. The analysis was confusing and was further hampered by the statement that the different "efficiency impacts" are not comparable to each other, and by the report not providing any conclusions, and by the AESO not clearly articulating the purpose of the analysis. The NERA report also did not address the threat of additional load defection from on-site solar. As has been seen in many jurisdictions, roof-top solar has proliferated resulting in significant utility revenue erosion. The AESO's proposed tariff will likely shift end use distribution tariffs from demand to energy charges by about $9/MWh. This will make roof top solar for commercial and institutional customers about 10% more economic, leading to decreased AESO revenues and tariff price increases. ii. Regarding the AESO's analysis on the impact on the energy market of a $9/MWh variable energy charge, this change would be dwarfed by power pool prices that can change hour to hour by 100 times as much. The AESO analysis based on the removal of the 12 CP charge was an impact of about $10 million/year. If the 12 CP charge is

		reduced by about 50%, the impact could be about $5 million per year, which is about 0.15% of the annual power pool market value. The DUC submits that the tariff impacts, based the AESO's analysis, would be minimal. What the NERA / AESO analysis missed is the impact the proposed B&R tariff changes could have on on-site generation development and the resulting impact on power pool prices.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	The DUC is undecided on its position with respect to the proposed B&R rate design. The DUC would like to review the cost of service study and the proposed allocation of costs to energy methodology in detail. The DUC is of the view that the current tariff continues to be appropriate for Alberta, in both the near and long term.
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	The DUC submits that the AESO's proposed "allocation of costs to energy" design is untested and non-industry standard.
5.	How would you describe your level of support for the "flat energy charge" element of the design?	The DUC is generally unsupportive of the AESO's "flat energy charge" design. A flat energy charge eliminates demand shifting and demand curtailment as options and only leaves self-supply as an option to manage tariff cost increases. It further skews the self-supply option towards baseload-type generation.
6.	How would you describe your level of support for the "5-year average of 12-CP" element of the design?	The DUC is unsupportive of the AESO's proposed 12 CP rachet. This rate design seems unnecessarily complex and we fail to understand how it will provide an appropriate or meaningful price signal.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	The DUC's main concern is the significant costs and disruption the AESO's proposed B&R rate design has and will continue to impose on Alberta businesses and the economy. The cost impact on price responsive and high load factor customers seems unwarranted for the minimal price reductions small distribution customers will experience.

8.	Additional comments	Please see the DUC's letter to the AUC, filed as Exhibit 25175-X0140, for the concerns the DUC has with the AESO's B&R tariff development process. The DUC re-iterates its desire and willingness to work cooperatively with the AESO to investigate tariff design options that will not have significant and material impacts on the economic wellbeing of Alberta, including a stand-by tariff for cogenerators and/or a separate rate class for price responsive and/or interruptible load customers.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021 through June 10, 2021	**Contact:**	Gerald Zurek
Comments From:	EPCOR Distribution & Transmission Inc.	**Phone:**	780-686-1186
Date:	2021/06/04	**Email**:	gzurek@epcor.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	Yes, EDTI found the session helpful. Yes, session 6A provided additional clarity.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	EDTI has no outstanding questions.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Somewhat supportive.
4.	How would you describe your level of support for the “allocation of costs to energy” element of the design?	Undecided.
5.	How would you describe your level of support for the “flat energy charge” element of the design?	Somewhat supportive.
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	Somewhat supportive.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	EDTI is concerned that the relatively large energy charge could incent more customers to choose to self-supply to avoid the energy based transmission charge. EDTI is still unsure why the AESO chose an energy charge over a monthly demand charge based on the customer’s peak demand for the month. The use of a monthly demand charge should incent customers that are able to respond to price signals to generally lower demand and increase load factor thereby making more efficient use of the transmission system.

8.	Additional comments	EDTI would like to understand whether excess generation occurs (on some systems) at the same time as the AIES monthly coincident peak and/or at times of monthly peaks on systems in the same area as the systems with excess generation. This may suggest a link between times of excess generation and system peaks.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021 through June 10, 2021	**Contact:**	Kurtis Glasier
Comments From:	Heartland Generation Ltd. ("Heartland Generation")	**Phone:**	587-228-9617
Date:	[2021/06/10]	**Email**:	Kurtis.Glasier@heartlandgeneration.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	Heartland Generation found Session 6A, hosted on June 3, 2021, to be valuable. The session provided additional clarity and a better understanding of the analysis, which supports the preferred rate design. It was particularly helpful that the AESO economists and the NERA expert presented and answered questions during the stakeholder session.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	At this time, Heartland Generation does not have any outstanding questions on the analysis presented in these two areas.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Somewhat supportive.
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	Somewhat supportive. Heartland Generation is concerned about the characterization of transmission costs being driven by generators on a regional basis. The generators at all times of operation are producing electric energy that is used to serve some portion of load in the province. A load that connects to the transmission system is given the opportunity in every hour to access the least cost electricity generated to meet load demand; the competitively offered merit order leads to allocative efficiency. The transmission system, by connecting all generation without risk of constraint/congestion (as required by the *Transmission Regulation*), is built to maximize this opportunity for load customers. Heartland Generation understands the preferred rate design accounts for this relationship in the demand vs. energy allocation; whereby, the demand allocation are the costs driven by capacity (that the system will accommodate each load's relationship to regional coincidence) and the energy allocation are driven by the opportunity for load to always be served by the cheapest form of generation at any time. Heartland Generation is curious if the billing determinants should be broadened to include regional peak measures as well. The AESO would retain the coincident peak charge to indicate a loads relationship with system demand. However, the energy charge could be shaped to reflect a loads impact on the regional peaks (e.g., peak gen). This would allow the tariff rate to reflect the fact that tariff costs are not flat in every hour but are informed by the relationship between regional loads and regional generation (see further comments below on the "flat energy charge").

5.	How would you describe your level of support for the “flat energy charge” element of the design?	Somewhat supportive. Heartland Generation suggests that the “flat energy charge” could be improved by shaping or profiling the costs to better reflect the cost of transmission in each hour. During the capacity market cost allocation discussions, a similar method of allocating generation capacity costs by ascribing different weights to different hours was used. A similar approach could be used to shape the energy charge based on the relationship between the utilization or stress of the transmission system varying throughout the day. Currently, it does not seem intuitive why the energy charge portion of the tariff would be equal during times of low utilization with abundant capacity and during times of system stress (not including the period of coincident peak). The AESO should explore the rudimentary shaping of the energy charge suggested above (e.g., using all regional peaks for all load customers), or some other method of profiling the energy charge to reflect differentiated system costs being driven in each hour. Inherently, shaping the energy charge portion of the tariff would allow a reasonable way of receiving an opportunity service tariff; a customer that utilizes the transmission system only during period of excess capacity, would receive a reduced effective tariff rate reflective of its decreased impact on transmission costs.
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	Undecided. Heartland Generation understands the “5-year average of 12-CP” to lessen rate shock in the long run, by smoothing the effect of any sudden shift in load behavior from year to year. However, it would also appear that this would lead to a rate “stickiness”, whereby a load customer that changed its behavior in year two would have the impact of that change lessened by the averaging with other years. This may require the AESO to further include exemptions or waivers when a load customer has significantly changed its behavior/operations/configuration in one year to avoid a penalization period of five-years while the “bad years” roll off. The implementation of the 5-year average can make this rate “stickiness” worse, as a bad first year will have an inflated impact on the average until year five is observed (e.g., the first year carries the inherent weight of 50%, 33%, 25%, and only reaches the normalized 20% impact in year 5 of implementation). Does the AESO expect load behavior to fluctuate year-over-year to the extent that a rate smoothing mechanic is necessary? Otherwise, it seems this mechanism would create a disincentive to load customer from making improvements year over year in reaction to the tariff. In the most extreme of cases a load customer could receive a rate for five years that is not reflective of its impact on system costs in any of those five years, and only representative of its average impact over those five years; this would result in a load customer performing to its five-year average rather than trying to lower costs and enhance savings in the future.

7.	Are there other elements of the design you support or have concerns with? Please be specific.	Heartland Generation remains concerned about the broader context of a tariff design at this time, with so many uncertain policy issues. It will likely need to be examined how the preferred tariff design will impact or be impacted by: the forthcoming *Transmission Regulation* expiry (and possible fulsome review), the outstanding policy direction and/or legislative changes regarding self-supply and export, the alignment of transmission and distribution interconnections/tariffs, and the distributed generation credits methodology. There is a massive confluence of related and impactful changes in the electricity industry, and the timing due to operational/commercial pressures from COVID-19 could not be worse.
8.	Additional comments	Heartland Generation does not have additional comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021 through June 10, 2021	**Contact:**	Vittoria Bellissimo
Comments From:	Industrial Power Consumers Association of Alberta (IPCAA)	**Phone:**	403 966 2700
Date:	2021/06/10	**Email**:	Vittoria.Bellissimo@IPCAA.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	(i) The Session was useful. It would have been helpful to present the NERA analysis before the AESO settled on their preferred rate design. (ii) There was some additional clarity.

2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	IPCAA has the following outstanding questions: • Has the AESO looked at the efficiency loss associated with a flat energy charge instead of a shaped one? • Did the AESO look at the distribution of congestion or forecasted congestion hours in all of the areas when the transmission was built? Is it flat? • How do the CTI projects fit within the explanation that NERA has provided? • Can you let us know if you will use a forecast or historical actuals for the energy/demand split? Also, will major transmission changes trigger an allocation change? Note that this question was answered during the webinar; however, the concern is that if we build a significant transmission addition and the energy/demand allocation does not change at all, how can we ensure we are basing the allocation on cost causation? • Can the AESO elaborate further on its use of gross peak load and peak generation instead of net? (slide 18). • Because of the considerable transmission overbuild, should the AESO start by determining the actual minimum system needed for current demand and generation, the costs for that minimum system and then apply this preferred rate design methodology? Then the AESO could examine an appropriate methodology for the costs of the system built for future use. • Is the longer-term plan to allocate the energy charge component of the rate design to generators via a change in the Transmission Regulation? The AESO's preferred rate design energy charge is flat; however, if charged to generators they would likely shape that charge to better reflect demand. • These charges will not translate through to distribution rates. Is the AESO taking this into consideration in its analysis? The majority of customers only see distribution tariffs.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	e) Not supportive
4.	How would you describe your level of support for the “allocation of costs to energy” element of the design?	Not supportive
5.	How would you describe your level of support for the “flat energy charge” element of the design?	Not supportive
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	Not supportive. Key concerns include: (1) understanding of this element is low; (2) initial years receive a much higher and sustained weighting, which could discourage innovative investments.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	IPCAA supports the 12 CP portion of the rate design; however, we are concerned that the level of 12 CP has been drastically reduced.

8.	Additional comments	• The AESO's and NERA's analysis uses load and price data from 2018 and 2019. With the return of the Power Purchase Arrangements (PPAs) on December 31, 2020, generator behavior and price outcomes have markedly changed in Alberta. The energy market is pricing in a substantial premium over marginal cost generation. In combination with increasing carbon prices, industrial sites have a very strong signal to self-supply. IPCAA would recommend that NERA re-estimate the amount of self-supply in response to the AESO's Preffered Rate Design using updated market information. • NERA's analysis does not account for enhanced self-supply from using heat and / or steam in industrial processes other than a reference in paragraph 23 of its report. IPCAA recommends that NERA update its analysis to include the substantial amount of industrial load that would be incented to self-supply due to its industrial processes. • Typically, reports such as the NERA Report, are released in advance and are used to inform decision making rather than to justify decisions that have already been made. Was the NERA Report commissioned and delivered ahead of the AESO's endorsement of its preferred rate design? • The AESO has provided an analysis of market efficiency losses and gains for the preferred rate design. Did the AESO conduct a range of efficiency analysis across various options? If such analysis has been done and is available, can the efficiency analysis for the various options be provided to stakeholders? • The AESO's efficiency analysis used the complete removal of the coincident peak charge (slide 56) and then determined an efficiency gain of approximately $10 M per year. Since the preferred rate design reduces the the CP charge by only ~40%, any efficiency gains should be markedly less. Can the AESO provide a more accurate analysis?

		• The AESO should provide their detailed analysis supporting the demand / energy classification. Customers are interested in understanding this analysis. In order to be both efficient and transparent, this should be done in short order.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021 through June 10, 2021	**Contact:**	Sharmen Andrew
Comments From:	MATL Canada and MATL LLP (MATL)	**Phone:**	403-818-0058
Date:	2021/06/10	**Email**:	sharmen.andrew@bhe-canada.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	The webinar and presentation were both valuable and provided additional clarity.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	MATL is seeking to understand the impact of the preferred rate design on export opportunity services (i.e., XOM/XOS) and other impacts to MATL and its customers.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Undecided
4.	How would you describe your level of support for the “allocation of costs to energy” element of the design?	Undecided
5.	How would you describe your level of support for the “flat energy charge” element of the design?	Undecided
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	Undecided
7.	Are there other elements of the design you support or have concerns with? Please be specific.	MATL has a general concern that the preferred rate design may adversely impact export charges and seeks to better understand the impacts on MATL and its customers.
8.	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	(i) Suncor did not find the session particularly helpful. The analysis was lacking a clear purpose, assumptions were overly limiting, and the results were non-comparable. (ii) Suncor's understanding of the AESO's preferred rate design has not improved as a result of the session.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	i. Suncor did not find the analysis helpful. Whether there is an increase in self-supply (under certain assumptions) is not relevant. Whether the design incentivizes an appropriate level of self-supply, demand shifting and demand curtailment is relevant but wasn't analyzed. ii. Suncor did not find this part of the session helpful. The analysis was lacking a clear purpose, was confusing, and did not lead to any conclusions.

	Questions	Stakeholder Comments
1.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Suncor remains undecided with regard to the preferred rate design. So far the explanations in support of the design have been unconvincing.
2.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	While there may be some merit to allocating a higher portion of costs to energy, Suncor is not convinced of the rationale or the detemination of the proportion.
3.	How would you describe your level of support for the "flat energy charge" element of the design?	Suncor is not supportive of the "flat energy charge." A flat charge is distortive and counter to cost causation.
4.	How would you describe your level of support for the "5-year average of 12-CP" element of the design?	Suncor is not supportive of the "5-year average of 12-CP." The calculation introduces unnecessary complexity for no apparent purpose.
5.	Are there other elements of the design you support or have concerns with? Please be specific.	Suncor is still trying to understand the rationale behind the components of the AESO's preferred design as well as to why the design is supposedly an improvement over the current rate design.
6.	Additional comments	Suncor is concerned that the AESO introduced a brand new rate design shortly before the filing deadline and that industry is now limited in its ability to consult on this design. In light of this, as well as the uncertainty around self-supply and transmission policy, a tariff filing based on the existing design seems more appropriate. This would create time to receive policy clarity and allow stakeholders to fully evaluate the appropriateness of this novel design.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021	through	June 10, 2021	**Contact:**	Mark Thompson
Comments From:	TC Energy Corp. (TCE)			**Phone:**	403-589-7193
Date:	2021/06/10			**Email**:	markj_thompson@tcenergy.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	TCE appreciates all opportunities for stakeholder consultation.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	While TCE appreciates the AESO's initiative to estimate the self-supply response resulting from its preferred rate design, the analysis performed by NERA was inadequate and insufficient. It would have been preferrable for the analysis to have been performed by an independent third-party rather than the same party that developed the rate design being tested. Unfortunately, the analysis did not accurately reflect the self-supply technology that would most likely be developed and did not include the potential increased use of existing self-supply. Accordingly, TCE does not have much confidence in the accuracy of the analysis and the question of the self-supply response remains unanswered.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Somewhat not supportive.
4.	How would you describe your level of support for the “allocation of costs to energy” element of the design?	Somewhat not supportive.
5.	How would you describe your level of support for the “flat energy charge” element of the design?	Not supportive.
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	Not supportive.
7.	Are there other elements of the design you support or have concerns with? Please be specific.	Please refer to the comments submitted by TCE in prior stakeholder engagements.
8.	Additional comments	TCE has no further comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021	through	June 10, 2021	**Contact:**	Luis Pando
Comments From:	TransAlta Corporation			**Phone:**	(403) 267-3627
Date:	2021/06/09			**Email**:	Luis_Pando@transalta.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	***The session was valuable and provided more information behind the proposed changes but the comment deadline was too short*** TransAlta appreciates the clarity provided with NERA's report and the AESO presentation. While the session provided an opportunity to understand and test the rationale used by the AESO and NERA, the deadline set for stakeholder comments was too short, and deprived stakeholders from the opportunity to carefully consider the information and craft thoughtful responses to assist the AESO. By rushing the engagement process and not adequately answering many stakeholders' questions and the Alberta Utilities Commission's information requests which pushes these issues to be dealt with later in the tariff proceeding. We view this as an undesirable outcome. The purpose of the delay in filing date to October should be to enable a fulsome stakeholder engagement process so that the regulatory process can be as efficient as possible. We recommend the AESO follows additional process to address all outstanding issues raised during the consultation and explain the reasons behind leaving out certain topics. In addition, the session could have benefitted from more analysis of the estimated efficiency losses and gains.

2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	***The methodology used to classify transmission costs between demand and energy is vague and not fully justified*** We have concerns with the definition of minimum versus actual system as it seems arbitrary and unsubstantiated. While the "minimum system" appears to be an engineering concept the methodology does not appear to account for possible changes in load or generation in the future, nor adequately reflects the big transmission build that occurred as a consequence of policy (Critical Transmission Infrastructure) which is not based on cost causation. In addition, we are unsure whether the regional perspective is truly a fair representation of a "minimum system" at a system level. We still have several questions about this new methodology that we wish the AESO to address: • Is generation adjusted to factor in the capacity factor of the resource or all installed MW accounted for in the same manner (e.g. 1 MW of solar is the same as 1 MW of gas)? • Installed generation capacity is typically greater than demand in order to ensure resource adequacy is met (generation capacity needs to provide a reserve margin). Doesn't this methodology therefore suggest that at a system level (where generation will be greater than demand) the transmission system is always in excess of the "minimum system"? • If a region has a retirement of a generating unit such that it becomes a region that imports power, does that translate into a reduction in the energy charge and an increase in demand charges? (Wouldn't a change in flows indicate greater use of the bulk system and be directionally misaligned with the change in energy charge?) ***We agree with NERA that the transmission tariff should be cost reflective and provide price signals that encourage efficient self-supply decisions and discourage inefficient self-supply by customers*** The assumption that less self-supply will be installed in the future due to future changes in carbon tax and gas prices, and the reliance of the study on self-supply that only considered gas generation (when it is more likely a scenario of increased solar and wind and other hybrid resources) needs to be tested. We note that the legislative framework and its restrictive

		exemptions for self supply are a key reason for more limited adoption of self supply (not the tariff). We also understand that the Government may be considering changes to the legislative framework that could include unlimited self-supply and export and if the legislative framework is changed we expect that there could be significant more self-supply in the future. To address this concern, we recommend the AESO update its own delivered cost of electricity report under the preferred rate design to test if self-supply and export would still be more economic than receiving power from the grid. This will allow the AESO to demonstrate that the estimate of limited self supply is fair and reasonable assumption. ***The AESO should take the opportunity to test their assumptions about load response to the preferred rate design by surveying load customers participating in this consultation*** The AESO is assuming low self-supply investments and low grid defection, all of which is uncertain, as these assumptions are highly dependant on how load customers will respond to the tariff changes. The AESO argues the increase in the energy charge creates a negligible impact due to the alleged positive gains that result from reaction to the 40% reduction in the 12 CP charge. Given that this consultation includes many of those load customers, canvassing customers about how they will likely respond to the preferred rate design would provide useful information to test these assumptions.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	***TransAlta is undecided because it is not clear that the new allocation methodology is a fair and reasonable way to redesign the bulk and regional tariff rates*** The preferred rate design represents a significant change in cost allocation which should clearly demonstrate an improvement from the current methodology. In addition to the concerns with the concepts of a "minimum" versus "actual" system, we do not have enough information to assess whether this new categorization of costs between energy and demand is reasonable or fair and we question how it will be applied consistently when the conceptual underpinning appears so arbitrary. This deemed difference between the "minimum" versus "actual" system implies a concept that there is "excess" infrastructure. We do not find these concepts to be helpful particularly when it is applied at a regional level. A minimum system is one that allows for the efficient transmission of generation to all load customers in the system (irrespective of which region they are in). The AESO must balance supply and demand and be certain that there is enough generation and transmission capacity to meet demand at all times. We are unclear how the regional view to categorize costs between energy and demand contributes to a better allocate transmission costs.
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	***The allocation of significant costs to the energy component provides a poor signal to consumers*** TransAlta has concerns about a design that would increase the energy charge by 5 times its current level. We are concerned that such a high energy charge could drive conservation behavior when we should be providing a signal for greater use of the transmission system (i.e. during off-peak hours). We question whether so much of the bulk and regional system cost is truly caused by the amount of energy that a customer consumes.

5.	How would you describe your level of support for the “flat energy charge” element of the design?	***The concerns raised about the flat energy charge have not been addressed*** NERA argues that recovery of fixed transmission costs based on “avoidable” charges aligns with cost causation because an embedded cost methodology recovers the costs associated with the long-run drivers. We do not agree with NERA’s conclusion. NERA has not addressed any of the concerns raised about the flat energy charge including: • Concern that fixed costs recovered on variable charges is not aligned with cost causation and would send inefficient price signals. • Concern that the flat energy charge is not consistent with time variation in use of transmission and would not send efficient price signals • Concern that “penalizing” high load factor customers who use transmission efficiently not aligned with sending efficient price signals. • Concern about impacts on long-term response, incentives for self-supply and cost shifting.
6.	How would you describe your level of support for the “5-year average of 12-CP” element of the design?	***A 5-year average may address billing determinant erosion but there are other approaches that should be explored*** We understand that averaging forces customers to show a consistent and more predictable response and may better align with transmission planning. The use of a 5-year average of monthly coincident peak could address the concerns about erosion of billing determinant but it does so at the expense of rewarding customers more promptly (within the billing period) for their behavioral response. In this respect, we question whether 5-year averaging and monthly coincident peaks is the right design. If the design is already using averages, we question whether the averages should be of 12-CP or rather an average of only those periods (winter and summer) that drive transmission builds would be more appropriate. We also question why a 5-year period was selected and ask the AESO to consider shortening the period. We ask to see analysis that considers 1, 2, 3, 4 and 5 year averages to understand the merits of using different periods length and the potential impacts on the tariff design.

7.	Are there other elements of the design you support or have concerns with? Please be specific.	We are concerned about the AESO proposed classification step before the functionalization of costs. As stated above, we are not compelled by the rationale and analysis provided to date about this step to distinguish between energy and demand costs. Moreover, the results in terms of the proposed tariff design associated with this new approach are a significant departure from the existing design and send the wrong signals.
8.	Additional comments	We are concerned that the preferred rate design does not provide efficient price signals for loads to use the transmission system.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – May 27, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A

Period of Comment:	May 27, 2021 through June 10, 2021	**Contact:**	Megan Gill
Comments From:	The Office of the Utilities Consumer Advocate	**Phone:**	403.819.5383
Date:	2021/06/07	**Email**:	Megan.Gill@gov.ab.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **June 10, 2021**.

The AESO is seeking comments from Stakeholders on Session 6A. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6A hosted on June 3, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6A with additional clarity and a better understanding of the preferred rate design?	i) The session provided the UCA with somewhat of a better understanding of the cost allocation rationale behind AESO's preferred rate design. ii) While the UCA has a better understanding behind the AESO's desire to adopt a minimum system approach and increase the amount of transmission costs recovered through an avoidable energy charge, significant questions around the economics of self-supply decisions, incentives, and long term outlook remain. The NERA study does not provide convincing answers on these critical issues. iii) The questions asked at the session and in these comments are more of the nature of post-filing information requests than pre-filing clarifications of design intent.
2.	Do you have any outstanding questions with the preferred rate design following the additional information provided in the following areas: i. Response to incentives under the preferred rate design (e.g., assessment of self-supply response) ii. Impact on wholesale energy market	i) Given that the AUC has acknowledged that a number of the self-supply generating units (cogen) in Alberta serve oil and gas facilities, the UCA would like to understand why the AESO used only the less efficient ACE and RICE technologies when estimating customer response to the recommended tariff. In addition, the UCA would like to understand why the AESO decided to publish a study using an average 2020 pool price of $49.39/MWh (given that 2020 was heavily influenced by the pandemic and average daily pool price in 2021 YTD is $96.44/MWh) instead of a forecasted pool price when analyzing the current and future economics of self-supply under the existing and proposed tariff structure.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the overall preferred rate design? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	The UCA is somewhat supportive of the overall preferred rate design as it is estimated to save residential, farm, and small business consumers between 2-5% of their transmission charges. However, the UCA believes there are still some areas which the AESO should consider to improve its preferred design to deter market participants from grid defection and uneconomic bypass in the future. • The AESO should consider gross metering instead of net metering provisions mandatory for generators with industrial system designations (ISDs). • The AESO should recover significantly more costs using NCP charges and reduce the amount recovered using avoidable energy charges.
4.	How would you describe your level of support for the "allocation of costs to energy" element of the design?	While the UCA has a better understanding of the AESO's justification for increasing the cost recovered through an energy charge under the preferred rate design, it is still unclear why the billing capacity allocation was reduced from 22% to 17%. The UCA still supports the consideration of NCP demand charge cost recovery and believes the AESO should consider modifying this determinant to improve the rate design.
5.	How would you describe your level of support for the "flat energy charge" element of the design?	The UCA is supportive of the AESO's intent behind the application of cost causation principles in using a minimum system approach to identify transmission costs associated with the flow of in-merit energy. However, UCA believes a better alternative to recovering such in-merit constraint removal costs through avoidable energy charges would be to recover them thorugh an NCP demand charge instead.
6.	How would you describe your level of support for the "5-year average of 12-CP" element of the design?	
7.	Are there other elements of the design you support or have concerns with? Please be specific.	

8.	Additional comments	The comment was raised by NERA that the intent of the preferred tariff design is to yield efficient outcomes, even if those lead to the pursuit of self-supply options by customers looking to avoiding transmission costs as reflected in the tariff. So, if increasing the energy charge allocation drives more load customers to deflect from the grid and self-supply, this can be considered efficient and subsequently considered an acceptable outcome. The UCA is concerned that a tariff that further incents self-supply and grid defection will result in further cross-subsidization between rate classes, especially between those that do not have the option to self-supply and how a disproportionate amount of the transmission cost recovery burden may inadvertently be placed on consumers who cannot move off the grid. In other words, price-regulated transmission rate design in particular is at least as much about fairness of cost recovery from captive customers as it is about providing efficient price signals concerning generation choices. The balancing of Bonbright principles still apply.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Bulk and Regional Tariff Design Stakeholder Engagement Session 6A hosted on June 3, 2021

I. Purpose and objectives of the session

The purpose of this session is to engage stakeholders in a discussion of Session 5 stakeholder feedback or follow-up and key questions raised by the Alberta Utilities Commission (AUC) staff, and to provide additional clarity and build mutual understanding of the AESO's preferred rate design and stakeholder concerns. The session objectives include:

- Present preferred rate design, including energy storage treatment, to stakeholders
- Present and discuss path to achieving minimal disruption
- Present bill impact summary and assumptions
- Provide Bill Impact Tool
- Begin to discuss implementation considerations

II. Session agenda

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose, and session objectives • Application filing extension requestion	AESO / Stack'd
8:15 – 8:45	Recap of preferred rate design and summary of stakeholder feedback received	AESO
8:45 – 9:15	Appropriateness of the flat energy charge • Time of use and dynamic pricing • On-peak versus off-peak charges • Min/max load factor energy charges • Q&A	AESO / NERA
9:15 – 10:15	Cost recovery through avoidable charges and efficiency • Avoidable and non-avoidable charges • Efficiency • Q&A	AESO / NERA
10:15 – 10:45	Break	
10:45 – 11:45	Analysis of self-supply in response to the preferred rate design • Self-supply analysis • Q&A	AESO / NERA

Public

Alberta Electric System Operator
Calgary Place, 2500, 330-5th Avenue SW Calgary, AB T2P 0L4
Phone: 403-539-2450 | Fax: 403-539-2949
www.aeso.ca
@theaeso

Time	Agenda Item	Presenter
11:45 – 12:45	Analysis of the short-term impact of the preferred rate design on the energy market • Energy charge • Coincident peak charge • Q&A	AESO
12:45 – 12:55	Session close-out and next steps	AESO

IV. Overall outcomes from the day

The main objective of the session was for the AESO to provide additional clarity and build mutual understanding of the AESO's preferred rate design and respond to stakeholder concerns. Participants engaged in discussion and overall, some stakeholders felt that this was a valuable session that allowed them to share their perspectives and feedback, while others felt that the session did not provide the value that they were seeking.

V.Session highlights

Captured below are the highlights of the questions and discussion on a topic-by-topic basis. For a detailed review of the session, please refer to the session recording, posted at www.aeso.ca.

Topic 1: Recap of the preferred rate design

i. Stakeholder commentary

- Clarifying comments:
  - *Suncor:* On Slide 18 (Minimum system illustrative calculation), is there double counting that's occurring here if you are not counting the flows between areas? Should we first recognize that all demand must be met from somewhere and can come from any region with only what's left over to be viewed as energy related in this calculation?
  - *TransAlta:* Could you explain the rationale behind the change in the method to first allocate between demand and energy and then functionalize between bulk and regional?

ii. AESO / NERA clarification

- Response to clarifying comments:
  - On Slide 18, the assessment is not in relation to the transfer of power between areas but to the relative size of the system within each area. By using the peak demand within an area as a proxy for the size of transmission in that area, and then accounting for any additional peak generation as a proxy for the additional transmission in that area, we are developing a measure of the degree to which the system is sized to accommodate demand and the degree to which it is sized (in addition) to accommodate generation.
  - The allocation between demand and energy as a first step is based on allocating the costs of transmission between demand and energy, since those are the two drivers of investment. Then allocating the demand costs between the different drivers of demand using bulk and regional distinction.

Topic 2: Appropriateness of the flat energy charge

i. Stakeholder commentary

- Clarifying questions:
  - *EPCOR:* I don't understand why the capacity required by generation is recovered by an energy charge. It seems that all capacity requirements, whether driven by load or generation, is capacity nonetheless and should be recovered through a demand-related charge?

Public

- *CCA:* Why is it important to consider the generation-related portion as energy related? Could it also be considered demand related and proportionately applied to other components of DTS?
- *ADC:* The transmission system is grossly oversized, so should the first step in the calculation be to determine the actual minimum system needed for current demand and generation, the costs for that minimum system and then apply your methodology? Then examine an appropriate methodology for the costs of the system built for future use.
- *IPCAA:* Is the ISO tariff proposal really a backdoor method to a change in the Transmission Regulation (T-Reg)? If the T-Reg were changed to allocate costs evenly between load and generation, generators would charge back that transmission cost via an energy charge. The difference being the AESO's transmission energy charge is flat and generation would likely shape that transmission charge to better reflect demand.
- *IPCAA*: Did the AESO look at the distribution of congestion or forecasted congestion hours in all of these areas when the transmission was built? Is it flat?

- Some participants were concerned with the AESO's design and use of individual areas:
  - *ANC:* On Slide 18, the major criteria for the tariff design that NERA has proposed is very arbitrary. There also seems to be double counting. Did the AESO look at the regional areas rather than all of the individual areas and if they did, what are the pros and cons compared to the 46 individual areas?
  - *Heartland Generation*: On Slide 18, should the analysis not be done on net peak load and net peak generation rather than gross?
  - *Heartland Generation*: Why do the relative sizes of the regions matter?
  - *Suncor:* The problem we're running into here is the arbitrary component comes into play with the size of the different areas. The size of the region impacts the split between demand and energy allocation. We cannot ignore the bulk and regional split and at the same time use a regional delineation to determine an allocation.

ii. AESO / NERA clarification

- Response to clarifying questions:
  - Need to have a distinction between the capacity of generation versus the use of energy. Generation capacity might be related to capacity costs, but the use of transmission to flow energy is an energy related cost. It would not be aligned with cost causation to allocate energy related costs to another, different characteristic of load.
  - The ISO tariff is required to recover the prudent costs that have been already approved. What the methodology is looking to do is to characterize or create a proxy for what should be allocated to demand related charges and what should be allocated to energy related charges.
  - Regarding congestion, the AESO did think about whether congestion was an appropriate metric. The challenge with using that as a metric is that the costs we're seeking to allocate have been incurred to avoid congestion from happening. Looking at the incidents of congestion doesn't tell us very much about the rationale behind building particular pieces of transmission.
- Response to questions regarding the use of areas:
  - The purpose of the AESO's methodology isn't to look at energy availability, it's to look at what size of the transmission system is needed and exists within the province. That's why

we're looking at peak load and peak generation as a proxy to measure the extent to which the transmission system is sized in each area.

- If we were to look at a reserve margin approach, we could take peak demand and compare it to generation and the ratio between the two could tell you something. But the size of the transmission system needed to accommodate these things depends on where and when these demands take place. Don't agree that there's double counting – the methodology we've proposed is pragmatically and reasonably accurate in identifying the degree to which transmission in each part of the system is sized to accommodate demand and energy.
- The AESO's rationale for using peak load and peak generation is that the size between areas is very different. That difference might not be captured with a netting process. For a given area that's much larger than another, you might not be able to capture the proportional size difference if the inflows are similar.
- Regarding the relative sizes of the areas, the difference in size matters because the minimum system requirements differ with the size of the area.
- The definition of the areas is not arbitrary; they were *not* created solely for the purpose of this tariff. They were created to represent the distinct parts of the transmission system for use in other areas (i.e., planning).

Topic 3: Cost recovery through avoidable charges and efficiency

i. Stakeholder commentary

- Some participants challenged the AESO's understanding of cost causation and efficiency:
  - *IPCAA:* How does your flat energy argument hold given that the majority of customers only see distribution tariffs?
  - *DePal Consulting:* I disagree with the premise that somehow the AESO's proposal is efficient. In the short term, you're going to have costs from customers who move to self-supply being pushed onto other customers. It seems that the customers who choose to remain on the grid will subsidize those that choose to leave.
  - *TransAlta:* How does recovering long-run transmission costs through a variable charge comply with the intergenerational equity part of the cost causation principle?
  - *CCA:* While having location-based marginal costs is not possible in Alberta, why is it not possible to provide marginal cost signals based on the avoided system cost of an incremental demand unit? This could be based on the avoided demand cost of a self-generator or it could be based on system expansion studies.

ii. AESO clarification

- Response to questions regarding cost causation and efficiency:
  - We're trying to design a transmission tariff that's as cost reflective as possible. In order to give parties the best information we can around the cost structures, we want to ensure the tariff structure aligns as closely as possible to the cost structure of transmission.
  - It's appropriate to have the costs associated with the need for energy recovered through the variable charge on energy. Ensuring that the tariff aligns as closely as possible with cost causation principles promotes intergenerational equity.
  - Regarding efficiency, in the short term, there will be a change and adjustment to allocation in costs. But the process that we're adopting is really about how we get the

Public

long-term signals right. It's important to separate out the short-term efficiency change from the potential long-term efficiencies.

- Regarding the potential of marginal cost signals in Alberta, it is important to recognize that the foundation of a marginal approach is that costs vary by area. What the AESO is trying to do with the embedded approach is to come up with a representative signal that averages costs and behaviours across the province.

Topic 4: Analysis of self-supply in response to the preferred rate design

i. Stakeholder commentary

- Clarifying comments:
  - *DePal Consulting:* We started this process four years ago with the problem that the AESO identified as high grid defection. However, the preferred rate design the AESO has chosen is worse than the rate design that the AESO initially identified as a problem. Why is the AESO recommending a design that's making the problem worse?
  - *Solas Energy:* Not understanding how the AESO is connecting the carbon price and the self-supply decrease? Would have thought it would be the opposite – as carbon price increases, self-supply would be a more likely response.
  - *CCA:* Future self-supply increases are more likely through solar than gas. Could this change the AESO's conclusion on the maximum shift to self-supply?
  - *Matt Ayres Consulting:* On Slide 49 (Changes in consumption in response to change in tariff), the AESO's prediction is reduced use of the grid for energy and increased use of the grid for backup. Can the AESO explain why a 17 per cent charge on capacity recovers the costs associated with providing backup?
  - *ADC:* The resulting rate design will have an impact on the industrial companies – if this change in tariff results in a particular sector of these manufacturing companies to no longer be economic in Alberta, what would you suggest would be the outcome if you can't make money under Alberta's new tariff?
  - *Suncor:* To the extent we still need new supply on the grid, can that same technology or similar enough technology be deployed behind the fence? If so, are we sending the right incentive to do so?

    To what extent does the tariff change the usage of existing generation? Due to the transmission credit, inefficient peakers can compete with combined cycles and run baseloaded behind the fence – doesn't this counteract the carbon tax?
  - *Wolf Midstream:* Directionally the new tariff should be constrained to keep high load factor / high load customers whole (and reduce grid defection). What would tariff look like if high load factor / high load were kept whole?
- Some participants pushed back on the assumptions that the AESO made in its report:
  - *Dual Use Customers:* The customers most impacted by the tariff design are high load factor industrials who use co-generation. The report misses the mark on co-generation and solar technologies. The AESO engages customers in the design and assumptions so this report looks more like justification for the tariff rather than providing any help to customers.
  - *DePal Consulting:* The AESO used the pool price from 2018-2019 for the report, but if you look at the current price in the first five months in 2021, the pool price is significantly

Public

different. As a customer looking at self-supply options, we're looking for the forecast of future pool prices; the data the AESO is using is strange.

- *CCA:* The NERA study seems to take a very static view of the industry. There is a much bigger change that seems to be taking place than what the study has taken into consideration. With decreasing billing determinants on the energy side, we're going to see higher and higher energy costs leading to a death spiral. How is the AESO going to deal with that?

ii. AESO/NERA clarification

- Response to clarifying comments:
  - The issue with 12-CP is that the more people respond to it, the greater the incentive to avoid it, as it becomes more expensive. While there will be a shift when we go from the current tariff to the new tariff in the first stage of adjustment, that response becomes more limited since it does not lead to increasing incentives for additional response through self-supply.
  - Regarding carbon prices and self-supply, the effect of the carbon price increase means that gas generation technologies become less economic when compared to potentially larger and more efficient units. Therefore, the increase in carbon price will cause the cost of behind-the-meter gas generation to increase.
  - Regarding the 17 per cent charge on capacity, the costs we're allocating are the shared costs of the transmission system for different purposes that are used to different degrees by participants. We have allocated different types of behaviours on the system and that's where the percentages are derived from – the extent to which a customer is making use of the system is reflected in the charges they face.
  - Regarding highly impacted customers, the AESO is focused on targeted mitigation with these particular impacted companies. We have identified the impact on these customers and are working on a transition plan through our ongoing targeted mitigation.
  - Regarding behind the meter generation, the AESO is seeking to reflect the cost structure of transmission. The carbon tax is rising and will cause the economics of behind the meter gas generation to worsen over time. This will tend to offset some of the increase in incentive to run gas generation behind the meter.
- Response to questions regarding the report and its assumptions:
  - The AESO made its assessment by looking at a broad range of potential scenarios with self-supply and different choices that customers could face. We have tried to take a broad view and not narrow in on a specific customer group or scenario.
  - Regarding cogeneration, the AESO acknowledges that cogeneration is a generation option. However, there are a whole range of options available for customers.
  - The analysis that was done in the report is forward looking to the extent that we're anticipating the growth in carbon pricing in the future. Technology may change over time, which may enable customers to self-supply – we haven't speculated how the market will change as technology changes.

Topic 5: Analysis of the short-term impact of the preferred rate design on the energy market

i. Stakeholder commentary

- Clarifying comments:

Public

- *Solas Energy:* On the illustrative example, what percentage of energy reduction are you estimating due to behind-the-meter (BTM) generation?
- *IPCAA:* One million dollars of efficiency loss is roughly how many MWs are responding to that $9 increase?
- *Alberta Newsprint:* The report only talked about the negatives of self-supply, none of the positives. Have they produced a similar report, would you share that report with us?
- *Suncor:* If we switch to the new rate design, we have an overall higher pool cost. At the same time, total load is decreasing. Does it seem realistic that we have increased energy charges and unchanged transmission charges, spread over a lower total load at a time when loads are telling the AESO that the total cost of delivered energy is skyrocketing?
- *Suncor:* If the numbers are not comparable, *i.e.* if we cannot look at a net impact, why is the AESO presenting us with these numbers/this analysis?
- *Capital Power:* Worried that this analysis does not hit the mark or address some of the concerns stakeholders have. Given the fact that people have already invested in responding to CP, how does the AESO justify that there will be any efficiency change at all? How would the AESO's analysis change taking into consideration that some of the 12-CP response is from behind the meter generation and the $9/MW hour energy charge will incent that further?

ii. AESO clarification

- Response to clarifying comments:
  - Regarding the number of MWs that are responding to the $9 increase, it is approximately 4 MW on average (over all hours, which doesn't show the shape and magnitude in the response in select hours). In many hours, we would see no response and then there are other hours where there is much more response.
  - We will assess whether additional information would be helpful to better understand the preferred rate design, including the request for 12-CP response in 2013 versus 2020.
  - Regarding the overall higher pool cost, CP intervals are at least somewhat correlated with higher prices in the energy market – it's possible that a smaller increase in load during these CP intervals could have a larger impact on the pool price than the decrease in load due to energy charge in all hours. But it's also possible the impact could go the other way and we think that in the scope of the short run response, it would be expected to be a small change either way. We're not making a claim that the energy market price will change in a particular way, we're looking at what the efficiency impact.
  - We heard from several stakeholders that they were concerned with how recovering transmission costs would impact the efficiency of the energy market. We estimated that quantity of impact to be $1 million from the energy charge. We think that this energy market impact is small given that moving to a tariff with better price signals will benefit the system overall. Additionally, to the extent that customers use more energy during CP hours, that may offset the efficiency loss from the energy charge.

Public

Agenda

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Session purpose and objectives

The purpose of the session is to engage stakeholders in a discussion of the AESO's targeted mitigation discussion outcomes, Session 5B (DOS) and Session 6A stakeholder feedback, and areas of alignment. The session objectives include:

- Provide an overview and seek stakeholder input on the outcomes of the targeted mitigation engagement
- Share our learnings and seek stakeholder input on Session 5B (DOS) and Session 6A stakeholder feedback and areas of alignment
- Present and discuss implementation considerations
- Seek to understand outstanding stakeholder concerns

Date: **Thursday, June 24, 2021**

Time: **8:00 a.m. – 1:00 p.m.**

Location: **Zoom Webinar**

Facilitator: **Stack'd**

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose and session objectives	AESO / Stack'd
8:15 – 9:00	Targeted mitigation engagement • Mitigation process and outcomes • Mitigation options • Mitigation next steps • Q&A	AESO
9:00 – 10:00	DOS modernization recommendation feedback and revisions (Session 5B) • Summary of learnings and feedback themes • Revisions to the DOS modernization recommendation resulting from feedback • Q&A	AESO
10:00 – 10:30	Break	
10:30 – 11:10	DOS modernization recommendation feedback and revisions (Session 5B) cont. • Summary of learnings and feedback themes • Revisions to the DOS modernization recommendation resulting from feedback • Q&A	AESO
11:10 – 11:30	What we heard – Session 6A • Summary of learnings • Q&A	AESO
11:30 – 12:00	Areas of alignment and misalignment • Summary • Q&A	AESO

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

June 24, 2021

Public

Notice

In accordance with its mandate to operate in the public interest, the AESO will be audio recording this session and making the session recording available to the general public at www.aeso.ca. The accessibility of these discussions is important to ensure the openness and transparency of this AESO process, and to facilitate the participation of stakeholders. Participation in this session is completely voluntary and subject to the terms of this notice.

The collection of personal information by the AESO for this session will be used for the purpose of capturing stakeholder input for the Bulk and Regional Tariff Design engagement sessions. This information is collected in accordance with Section 33(c) of the *Freedom of Information and Protection of Privacy Act*. If you have any questions or concerns regarding how your information will be handled, please contact the Director, Information and Governance Services at 2500, 330 – 5th Avenue S.W., Calgary, Alberta, T2P 0L4, by telephone at 403-539-2528, or by email at privacy@aeso.ca.

Using Zoom – Asking questions

- Two ways to ask questions if you are accessing the webinar using your computer or smartphone
  - Click “Raise Hand” and the host will be notified that you would like to ask a question. The host will unmute your microphone, you in turn will need to unmute your microphone and then you can ask your question. Your name will appear on the screen, but your camera will remain turned off.
  - Click “Lower Hand” to lower it if needed.
  - You can also ask questions by tapping the “Q&A” button and typing them in. You’re able to up-vote questions that have been already asked.
- If you are accessing the webinar via conference call
  - If you would like to ask a question during the Q&A portion, on your phone’s dial pad, hit *9 and the host will see that you have raised your hand. The host will unmute your microphone, you in turn will need to unmute your microphone by hitting *6 and then you can ask your question. Your number will appear on the screen.

Stakeholder participation

The participation of everyone here is critical to the engagement process. To ensure everyone has the opportunity to participate, we ask you to:

- Listen to understand others' perspectives
- Disagree respectfully
- Balance airtime fairly
- Keep an open mind

Welcome and Introductions

Public

Session purpose and objectives

- The purpose of the session is to engage stakeholders in a discussion of the AESO's targeted mitigation discussion outcomes, Session 5B (DOS) and Session 6A stakeholder feedback, and areas of alignment The session objectives include:
  - Provide an overview and seek stakeholder input on the outcomes of the targeted mitigation engagement
  - Share our learnings and seek stakeholder input on Session 5B (DOS) and Session 6A stakeholder feedback and areas of alignment
  - Present and discuss implementation considerations
  - Seek to understand outstanding stakeholder concerns

Agenda

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose and session objectives	AESO / Stack'd
8:15 – 9:00	Targeted mitigation engagement • Mitigation process and outcomes • Mitigation options • Mitigation next steps • Q&A	AESO
9:00 – 10:00	DOS modernization recommendation feedback and revisions (Session 5B) • Summary of learnings and feedback themes • Revisions to the DOS modernization recommendation resulting from feedback • Q&A	AESO
10:00 – 10:30	Break	
10:30 – 11:10	DOS modernization recommendation feedback and revisions (Session 5B) cont. • Summary of learnings and feedback themes • Revisions to the DOS modernization recommendation resulting from feedback • Q&A	AESO

Agenda

Time	Agenda Item	Presenter
11:10 – 11:30	What we heard – Session 6A • Summary of learnings • Q&A	AESO
11:30 – 12:00	Areas of alignment and misalignment • Summary • Q&A	AESO
12:00 – 12:20	Break	
12:20 – 12:30	Implementation considerations • Q&A	AESO
12:30 – 1:00	Session close-out and next steps • Rate sheets written consultation • Overall engagement survey • AESO application and the AUC process • Q&A	AESO

Overview of Engagement Process

Public

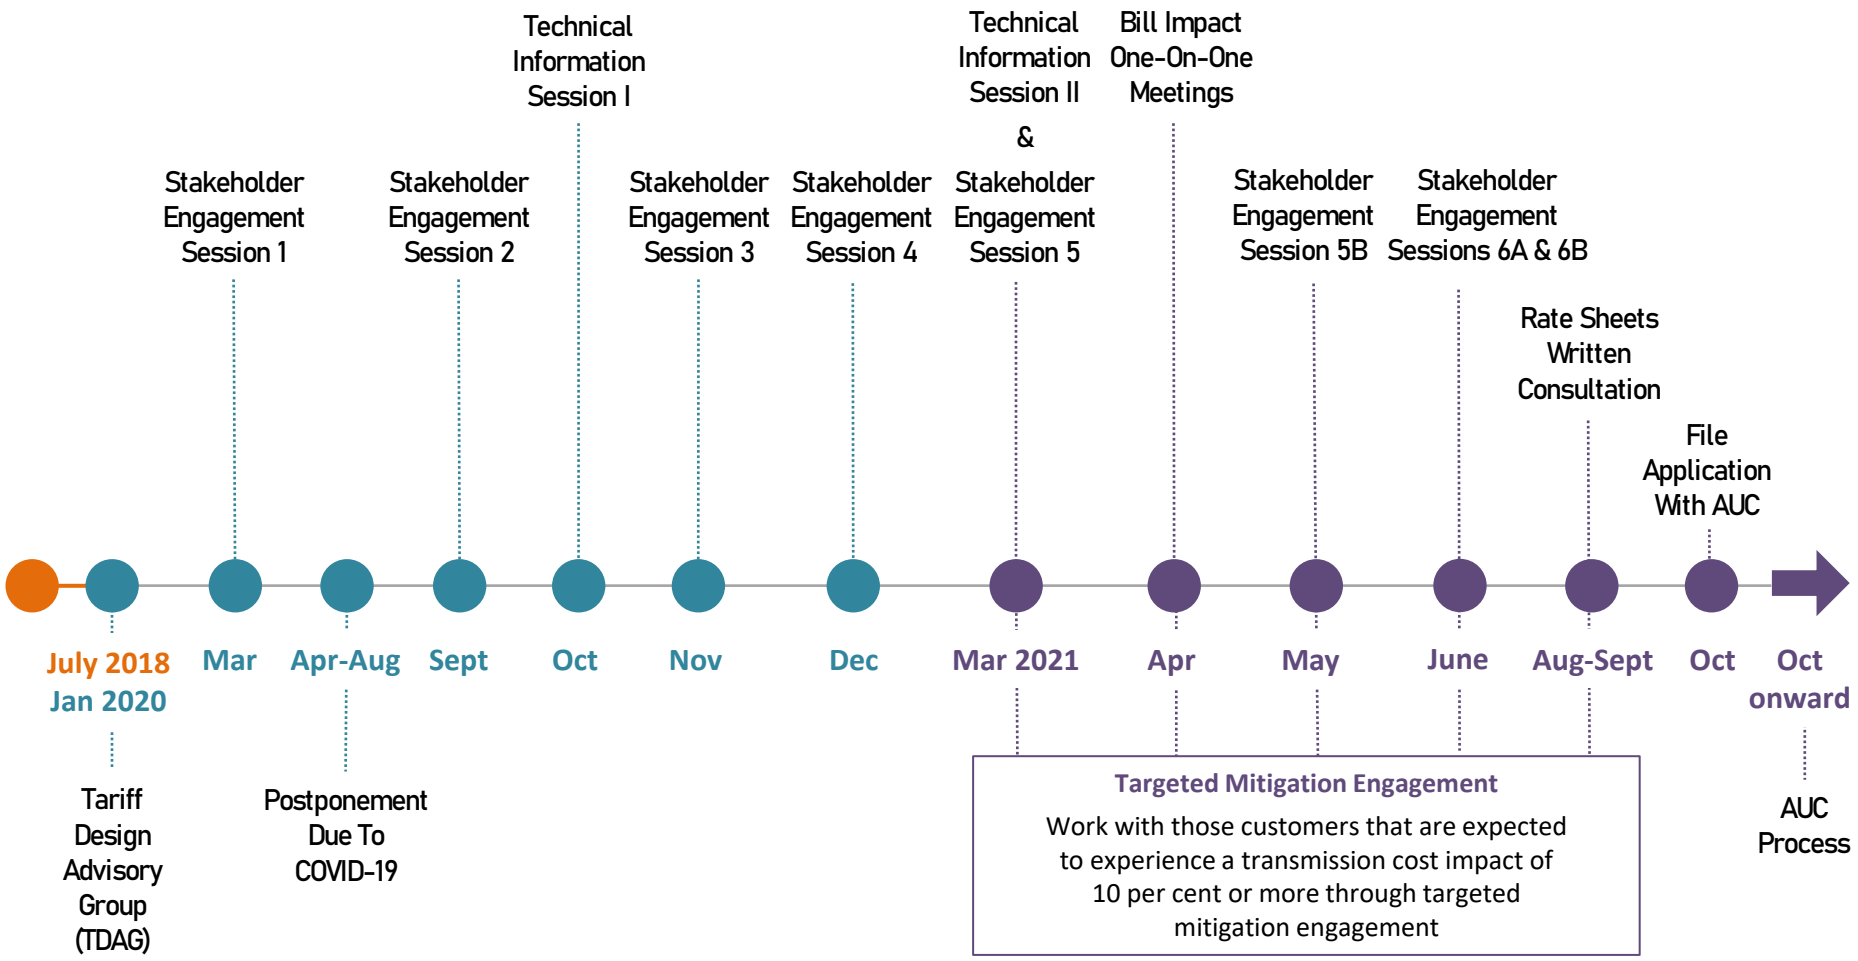
AESO Stakeholder Engagement Framework

Stakeholder engagement

The AESO's stakeholder engagement will:

- Ensure that stakeholders' needs and interests are consistently, transparently and meaningfully considered in the development of a rate design proposal for bulk and regional cost recovery;
- Provide clear objectives to be examined and evaluated in the development of a rate design proposal for bulk and regional cost recovery;
- Assist stakeholders in understanding and evaluating the AESO's preferred rate design;
- Supply stakeholders with tools that will allow them to consider and assess the impact of the AESO's preferred rate design; and
- Identify areas of alignment in order to support an efficient regulatory process.

Stakeholder engagement timeline



2018-19 2020 2021

Your participation

- Your participation to date has been very insightful to the AESO in understanding your perspectives and helping the AESO develop its preferred rate design proposal
- Your continued participation in this engagement is critical to help us prepare a well-informed application to the AUC for the benefit of Albertans
- We are looking for collaborative solutions to minimize the disruption for customers who are impacted by these changes, and your continued engagement is critical for our success
- The AESO recognizes the importance of providing clarity on this initiative for all of Alberta's electricity consumers

Targeted Mitigation Engagement Outcomes

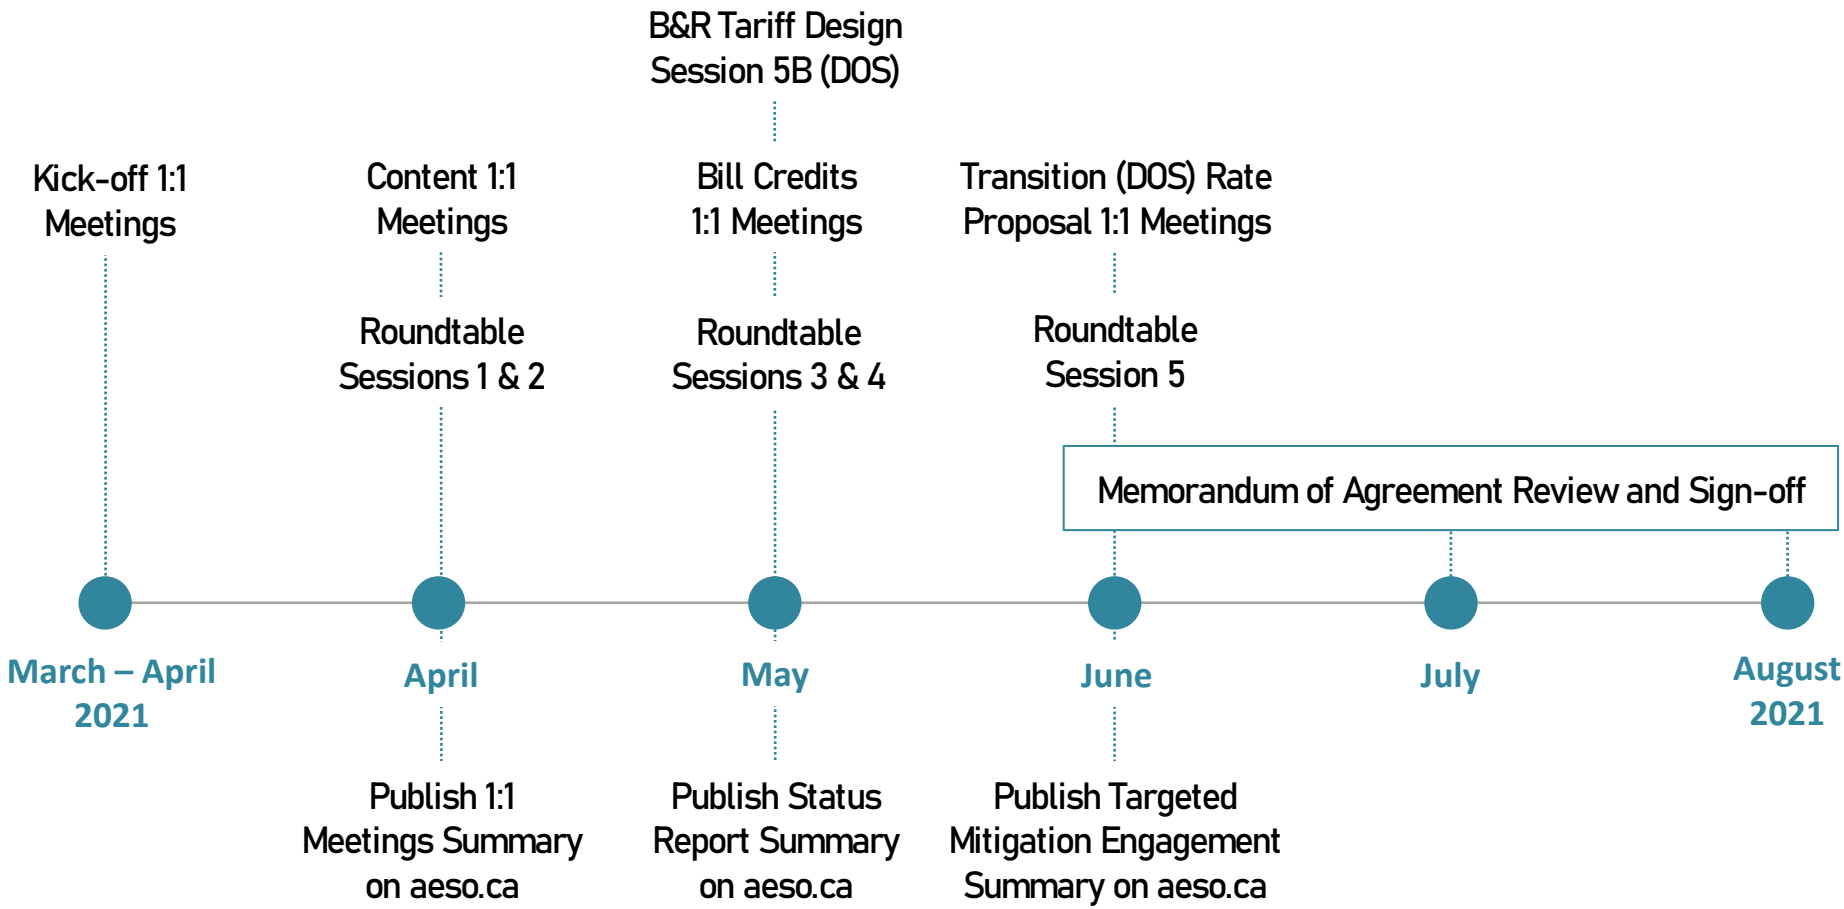
Public

AESO mitigation proposal starting principles (from B&R Session 5 March 25, 2021)

The AESO is seeking to develop a mutually acceptable mitigation proposal with the small group of impacted loads that will:

1. **Limit the rate impact for customers**: Mitigate rate impact to under 10 per cent increase to a party's transmission bill for initial stage of transition
2. **Adapt with design and rates**: Ensure options are adaptable to changes to the preferred rate design and forecasted rates
3. **Consistent application**: Mitigation options can be applied consistently across all impacted loads and not be individually defined
4. **Administrative simplicity**: Feasible to implement with current tools and systems
5. **Mutually acceptable**: Account for feedback from broad stakeholder group

Targeted mitigation engagement timeline



B&R: Bulk and Regional
DOS: Demand Opportunity Service

Mitigation outcomes

- Three alternatives explored:
  - A phasing-in of the preferred rate design and/or bill credits
  - A modernized demand opportunity service (DOS) rate
  - A non-firm interruptible rate class (i.e., a separate rate class for flexible loads that exists permanently and maintains costs for these loads where they are today and would be distinct from DOS)
- The AESO and significantly impacted stakeholders continue to hold differing views of mitigation being transitionary versus permanent treatment
- Non-firm interruptible rate class not accepted by AESO as a feasible alternative
- Engagement had led to three mitigation options:
  - Transition (DOS) Rate
  - Bill credits
  - Combination of Transition (DOS) Rate and bill credits

Memorandum of Agreement

- The AESO is developing a Memorandum of Agreement (MOA) based on the targeted mitigation engagement completed to date
  - Will continue to iterate with the impacted parties through the end of August 2021 to finalize the MOA and determine which of the impacted parties will sign the MOA
- The final MOA will be presented to the broader stakeholder group and the Alberta Utilities Commission (AUC or Commission) as part of the formal Bulk and Regional Tariff Application
  - The AESO will seek approval of this MOA from the Commission in conjunction with its preferred rate design and modernized DOS rate
  - MOA does not preclude parties from making submissions to the Commission on the merits of the preferred rate design or modernized DOS rate

Memorandum of Agreement (cont.)

- If the preferred rate design is substantially approved, the impacted parties that sign the MOA supports the use of these mitigation options
- Any party is eligible for approved mitigation options if their estimated transmission cost impact is greater than or equal to a 10 per cent increase
  - Parties that sign on to the MOA may not be eligible for mitigation if the Commission substantially approves the preferred rate design but makes minor changes that result in that party's transmission cost impact falling below the 10 per cent threshold
  - Impact will be estimated based on 2019 usage and approved rate design

Option 1: Transition (DOS) Rate

- Transition (DOS) Rate is a temporary variation of DOS
  - The 20 per cent limit to the load factor on contracted DOS load will apply if the contracted DOS level reduces the estimated transmission bill increase to below 10 per cent;
  - Otherwise, the DOS load factor can exceed 20 per cent up to levels that reduce the estimated transmission bill increase to 10 per cent (based on 2019 usage);
  - All other terms and conditions of the modernized standard DOS rate will apply
- Transition (DOS) Rate will be available for five years and comes into effect when preferred rate design becomes effective
- Upon expiry, any party operating under the Transition (DOS) Rate provisions will be required to meet the provisions of the standard DOS Rate
- Parties can make adjustments to their DOS level until end of year three; after that a DOS representation will be required

Option 2: Bill Credits

- The AESO will apply bill credits to the DTS bill for a site, in the form of an energy charge credit
- The calculation of the credit on energy charge is consistent for all sites; but the resulting credit will differ between sites based on mitigation value to reach a 10 per cent transmission bill impact

Energy charge credit percentage estimated as:

Credit on Energy Charge = ((Annual Transmission Costs [under 2019 ISO tariff rates] X 110%) – (Annual Transmission Costs [under AUC approved design])) / (Energy [2019 Site Actual Energy] X Energy Charge [under AUC approved design])

- Credit will be available for five years, starting when the approved rate design takes affect, decreasing by 20 per cent each year

Option 3: Combination

- A variation from bill credits which takes into account any reduction in transmission bill impact due to use of Transition (DOS) Rate

Energy charge credit percentage estimated as:

Credit on Energy Charge = ((Annual Transmission Costs [under 2019 ISO tariff rates] X 110%) – (Annual Transmission Costs [under AUC approved design]+ **DOS Rate**)) / (Energy [2019 Site Actual Energy] X Energy Charge [under AUC approved design])

- Credit will be available for five years, starting when the approved rate design takes affect, decreasing by 20 per cent each year

Mitigation eligibility and option selection process

- Should the preferred rate design be substantially approved the AESO will recalculate transmission bill impact estimates to identify highly impacted parties
  - Using substantially approved preferred rate design, including approved functionalization, approved demand/energy split, 2019 usage and 2019 test rates (based on 2019 billing determinants and revenue requirement)
- Highly impacted parties will be informed they are eligible for mitigation
- Highly impacted parties must inform the AESO within 45 days of their selected mitigation option, including the Transition (DOS) Rate contract amount
- If the substantially approved preferred rate design results in a significant change in the number of parties with a greater than 10 per cent transmission cost impact the MOA will become void

Mitigation implementation

- Should the preferred rate design and the MOA be approved the AESO will file an ISO tariff rider setting out the following as part of its compliance filing:
  - List of highly impacted parties (those parties that are expected to experience an increase of 10 per cent or more transmission cost impact)
  - Mitigation option selected by each impacted party
  - Transition (DOS) Rate contract levels elected by highly impacted parties that select this option, along with load factor limit if greater than 20%
  - Energy credit values for highly impacted parties that select this option

Estimated value of the mitigation options

- The transitionary bill mitigation options for the significantly impacted parties result in the following estimated mitigation value (or cost)
  - Estimates represent upper bounds for either option 1 or 2 if all parties select that specific option; costs for option 3 would fall under these upper bounds

	Estimated Billing Determinant Impact	Estimated Per Unit Impact	Estimated Total Mitigation Value (or Cost) for 5 Years
Option 1: Transition DOS (for amounts greater than 20% LF)	81 MW reduction in billing capacity	Monthly $3,509/MW of billing capacity	$17.0 million
Option 2: Bill Credits	1,970 GWh - Annual	Average Year 1 Credit of $3.30/MWh (Declining annually)	$19.5 million

- The actual mitigation value (or cost) will depend on the impacted parties' option selection and actual operations

Targeted mitigation next steps

- Drafting and finalizing MOA (June to August 2021)
- Impacted parties decide whether or not to sign, including a rationale for their decision (August 2021)
- MOA will be included as part of the AUC application (October 2021)
- Implementation of the mitigation options will be included as part of the compliance filing (post AUC decision)

Questions?

Public

DOS Modernization Recommendation Feedback & Revisions

Public

Stakeholder feedback

- Review of the stakeholder feedback on the DOS Modernization Recommendation highlighted the following themes:
  - DTS cannibalization / erosion
  - DOS Rate charges
  - Business case
  - DTS contract level
  - 20 per cent load factor
  - Bidding requirement for DOS load
  - Settlement and monitoring
  - Other items

Feedback theme: Risk of DTS erosion

- Some stakeholders expressed concern the proposal doesn't prevent DTS cannibalization
  - Concerns modernized DOS will contribute to erosion of billing determinants
  - Concerns modernized DOS will result in higher overall costs to consumers due to different self-supply dispatch decisions for load on DOS
  - Some stakeholders suggested the AESO provide energy storage with its own rate so as not to risk cannibalizing DTS
  - Define metrics for success

Proposal seeks to find the balance

- The objective of DOS is to reduce the level of average rates charged to DTS customers by applying the additional revenue earned from the use of temporarily under-utilized transmission system assets
- To meet this objective, the qualification for DOS requires ensuring that the consumption would not have occurred under Rate DTS
- To enable this:
  - Consistent and reliable application of qualification criteria is essential to the success of opportunity rates
  - Sufficient rights and remedies to deter and remedy any misuse of Rate DOS

Feedback theme: DOS Rate charges should be reviewed

- Some stakeholders stated the DOS rate design (charges) should be in scope
  - Discounted rates are a policy matter
  - No sunk costs should be recovered through DOS charges
  - DOS load bidding in market so should pay same rates as generators

Rationale for maintaining DOS rate charges despite DTS changes

- The purpose of Rate DOS is to provide the opportunity to generate additional tariff revenue to the benefit of all rate payers by enabling consumption that would be uneconomic and not otherwise occur under Rate DTS
- If Rate DOS customers only paid for short-run variable costs, then rate payers would not be better off, as the payments made by Rate DOS customers would only serve to offset the costs they directly impose
- The energy charge of the preferred rate design is representative of the historical long-run contribution of energy consumption to investment in transmission infrastructure
- To charge DOS customers less than this amount would run the risk that facilitating their consumption of energy would cause more system costs in the long-run than the revenue they contribute, leading other rate payers to be made worse off

Feedback theme: Challenges with the business case

- The original recommendation for Rate DOS required customers to provide a business case that the AESO would review regarding the economic rationale for using Rate DOS
- Range of stakeholder concerns with the qualification business case:
  - Clarity, transparency and standardization of criteria needed
  - Requirements need to be more strict
  - DOS should be an alternative to load retention rates
  - Only evaluate the business case at one point in time
  - Standardize for energy storage
  - Parties should not have to disclose economic information
  - AESO unqualified to assess

Business case: Alternative proposal

- Shift from business case to customer representation
  - Instead of providing a business case to the AESO, a customer makes a representation to the AESO that its use of Rate DOS will enable consumption that would be uneconomic and would not otherwise occur under Rate DTS
  - The representation would be standardized and included in the application form for Rate DOS. A brief description of the reasons for using DOS would be included in the application form, but it would be used for audit purposes
  - The AESO would monitor users of Rate DOS for indications that the representation they provided is untrue and that the customer requires firm service or otherwise appears willing to pay the higher Rate DTS, including, but not limited to: (1) failing to respond to dispatches or directives, (2) exceeding the contract capacity, (3) exceeding the maximum load factor limit
  - If the AESO determines a customer has misrepresented its use of Rate DOS, the AESO may charge and recover Rate DTS plus interest and any other costs or damages incurred, and may restrict future use of Rate DOS by the customer

Business case: Alternative proposal

Options	Advantages	Disadvantages
Original proposal (business case)	• Already specified within the Terms and Conditions and accepted by AUC	• Subjectivity • Administrative burden for AESO • Uncertainty for applicant
Alternative proposal (representation and no business case)	• No AESO assessment • At the time of the application, the AESO will rely upon the market participant's representation that the consumption is uneconomic under Rate DTS	• Reliance on monitoring and remedy provisions to protect rate payers against misrepresentation • Remedies, which would include claw backs, could result in significant financial liabilities for market participants if they misuse Rate DOS

Qualification: Shift from business case to customer representation

- The AESO recommends the alternative proposal and standardizing the application for Rate DOS to include a representation
  - The representation will ensure the customer understands the purpose of Rate DOS and ensures its described use of Rate DOS aligns with this purpose
  - Removes the need for customers to provide a detailed business case and for the AESO to review such detailed business case as part of the application process; however, customers will have to perform their own due diligence to ensure they can make the representation
  - The terms and conditions for Rate DOS would include sufficient remedies to deter and remedy misuse of Rate DOS

Qualification checks

- To validate there are no issues with use of DOS at point of qualification the following will be confirmed:
  - **All DOS customers**
    - Application form is complete and signed
    - Technical assessment to ensure DTS + DOS contract capacity use does not exceed connection capability, or cause transient stability or voltage control problems
    - Are capable of consuming up to the DTS + DOS contract capacities
    - Demonstrate the ability to recall DOS energy
  - **Storage**
    - STS contract capacity $\gtrsim$ DTS + DOS contract capacity

Feedback theme: DTS contract level should be determined by the customer

- Stakeholders suggested:
  - The DTS requirement should be determined by the customer
  - The AESO should clarify its intent around requiring energy storage assets to also have a DTS contract, when one of the reasons for being granted a DOS contract is that operating under DTS is unfeasible for the project

DTS contract level will be determined by the customer

- The DOS rate will not specify a minimum DTS level for DOS load; however, Rate DOS requires Rate DTS service as an applicability provision
  - Having Rate DTS service ensures that the AESO can appropriately apply other ISO tariff terms and conditions
  - The AESO is not proposing to change this requirement to have a DTS contract
  - A non-zero DTS contract will be required for DOS
- The customer will determine the appropriate contract capacities and assume the risks of such contract levels
  - Recall risk: Increases as more customers use DOS or DTS in area
  - Request to switch to DTS: Requires standard SASR timelines
  - Ancillary service qualification risk: Can the service still be provided in the event of DOS recall?

Feedback theme: Twenty per cent maximum load factor too limiting or ineffective

- The AESO received mixed feedback on maximum load factor of 20 per cent:
  - Load factor limits revenue maximization
  - Historical use not representative
  - Not high enough for certain storage options or high load factor loads
  - AESO should study further for storage charge and discharge
  - Load factor limit should eliminate the need for a business case
  - Ineffective replacement for ‘short-term and temporary’ and does not limit DOS applications

Maintaining the twenty per cent maximum load factor in DOS recommendation

- The driver behind the 20 per cent load factor is a replacement for short-term and temporary use of available transmission capacity
  - The measure is not designed to meet specific customers needs and should not consider technology or load type
  - The 20 per cent load factor is the replacement for subjective assessment of short-term or temporary use; the higher the load factor the less it represents short-term or temporary use
  - While a low load factor may reduce the opportunity for revenue maximization, it also guards against Rate DTS cannibalization
- The AESO will maintain the 20 per cent maximum load factor as a technology agnostic quantitative requirement to reduce subjective qualification for Rate DOS while also deterring DTS Rate cannibalization

Feedback theme: Bidding requirement for DOS load unclear or complex

- Stakeholder concerns with bidding DOS loads:
  - Should be a standing bid with “down-to” DTS requirements
  - Requiring bidding negates the half-range option for storage
  - Bidding requires more examples, more consultation, more understanding of associated costs
  - Concerns with linking DOS (transmission rate) to energy market outcomes
  - Allow parties to chose between bidding or transaction request

Simplified approach to bidding

- The AESO understands the concerns related to bidding complexity and recommends DOS customers consider a simplified bidding approach:
  - Standing bid at $999.99/MWh equal to DOS contract capacity
    - Dispatch on indicates participant may consume as much DOS as was dispatched
    - Dispatch / directed off indicates participant cannot consume the volume of DOS energy dispatched off
    - More sophisticated bidding strategies are available to participant if desired
  - A second block at $0.00/MWh can be used to allow participant to manage their load factor
    - When energy is moved from $999.99/MWh to $0/MWh, participant will be dispatched off and would stop using DOS energy
    - When energy is moved from $0/MWh to $999.99/MWh, participant will be dispatched on and may start using DOS energy

Simplified approach to bidding (cont.)

- Dispatch on does not require the participant to use DOS capacity, the bid dispatch permits the use of DOS capacity
- Dispatch off prohibits the use of all or portion of DOS capacity
- Simplified approach applies to traditional loads and storage
- DOS less than 5 MW will not qualify until such time that ISO rules permit lower bid volumes
  - Market submissions under 5 MW planned for implementation prior to 2024
- For more information, please refer to the Demand Opportunity Service (DOS) Bid Examples document located on the AESO website

https://www.aeso.ca/assets/Uploads/Session-5B-DOS-Bid-Examples-FINAL.pdf

Feedback theme: Clarifications for settlement

- Stakeholder concerns with settlement:
  - AESO should clarify how monthly settlement works with an annual max load factor
  - POD charges should be separated out (so loads can have confidence their POD is maintained with a low DTS level)
  - Remove loss charge as unclear why DOS load pays losses

Monthly settlement of annual load factor updated

- DOS customer is allocated a 12-month load factor balance equal to the DOS contract capacity x hours in 12-month period x 20%
- Each month settled against the remaining 20 per cent load factor balance
  - Settlement maintains the load factor energy balance
  - Exceeding the DOS load factor level of 20% over the year will result in charges at the ~~DOS~~ DTS surcharge rate
- Impact of exceeding DTS + DOS contracted MW levels
  - Metered energy above the DTS + DOS contracted MW levels will be charged as Rate DTS (aligned with current Rate DOS) and therefore will not contribute the 20 per cent load factor
  - May result in a DTS contract adjustment to reflect usage

Monthly settlement of DOS considering annual maximum load factor illustrative example updated

- Customer allocated DOS energy to use over 12 months (ex. 17,520 MWh)
- The DOS load factor energy balance declines as DOS energy is used
- Once DOS load factor energy balance drops to zero any DOS energy consumed would be charged at the DTS surcharge rate
- Load factor energy balance reset after 12 months

Line Item	Description	Jan	Feb	Mar	Apr	May
DOS Contract capacity (MW)		10	10	10	10	10
DOS Energy used (MWh)	Energy above DTS contract capacity	1455	1200	2000	7440	7440
Load factor energy balance at month end (MWh)	8760 h *10 MW * 20% = 17520 MWh allowed	16065	14865	12865	5425	-2015
DOS charges ($15/MWh)	DOS Energy Used x $15/MWh	-$21,825.00	-$18,000.00	-$30,000.00	-$111,600.00	~~-$22,785.00~~ -$81, 375.00
DTS surcharge ($110/MWh)	The energy charged at the DTS surcharge rate	$0.00	$0.00	$0.00	$0.00	-$221,650.00
Total charges ($)	DOS charges plus DTS surcharge or credit	-$21,825.00	-$18,000.00	-$30,000.00	-$111,600.00	~~-$244,435.00~~ -$303,025.00

Losses settlement under rate DOS updated

- An underlying principle of an opportunity service is that all costs caused in provision of the service are paid by the consumer of the service
- The use of DOS capacity causes losses on the system that would not otherwise occur, and therefore Rate DOS should include a losses charge
- Without it, generators are subsidizing the use of DOS since generators will pay the cost of losses
- Note: the losses charge can be minimized by consuming DOS energy when energy prices are low, because the ~~DOS~~ losses charge is a percentage of pool price

POD charges with Rate DOS

- Rate DTS POD charges are based on one definition of billing capacity, relied on for both regional and POD charges
- Currently the ISO tariff has no requirement for the installed capacity of interconnection facilities to align with Rate DTS contract levels
- Upcoming comprehensive Customer Contribution Policy review will look at a number of issues including interconnection facilities cost, AESO investment, standard facilities, installed versus contract capacity and customer contributions

DOS monitoring

- Regular monitoring:
  - As mentioned earlier, the AESO would monitor users of Rate DOS using certain criteria which may indicate that the representation they provided is untrue and that the customer requires firm service or otherwise appears willing to pay the higher Rate DTS, including, but not limited to: (1) failing to respond to dispatches, (2) exceeding the contract capacity, (3) exceeding the load factor
  - The existence of these criteria would automatically give rise to a presumption that the customer has misrepresented its use of Rate DOS; however, there would be an opportunity for the customer to explain or provide additional information to rebut the presumption
  - The AESO would ultimately make the final determination

DOS monitoring (cont.)

- If the AESO finds the market participant has mispresented its use of Rate DOS, the AESO may:
  - Charge and recover Rate DTS plus interest over the historical period (potentially the entire period the Rate DOS applied) and any other costs or damages incurred
  - Restrict future use of Rate DOS by the customer
- Market dispatch violations will be referred to Market Surveillance Administrator (MSA)

Other Items

Public

Allowing DOS for unplanned outages or derates

- Some stakeholders suggested that DOS be available for use for self-supply generator outages and derates, as few cogenerators currently utilize Rate DOS for planned outages due to the rate's inflexibility and there may be opportunities for increased transmission tariff revenue that is currently foregone
- DOS should not be considered a stand-by rate
- Given the modernization of Term type DOS, with the removal of the transaction request and having DOS loads bid into the market, the AESO could allow the use of Term type DOS for self-supply generator derates and unplanned outages provided the customer has controls in place to allow for DOS recall
- This will maximize transmission tariff revenue by allowing sites that have not contracted DTS for stand by to use the grid rather than curtail load

Separating the filing of Rate DOS from the Rate DTS

- Some stakeholders suggested that Rate DOS be a separate application
- In the interest of regulatory efficiency by having one application and one proceeding, the AESO does not plan to file a separate application for Rate DOS at this time

DOS availability and Connection Process

- Stakeholders requested the AESO to provide more information, including:
  - More details on SASR process for DOS (stages AESO will assess DOS qualification, connection study)
  - Capability maps of DOS availability
  - Notice (five years) to DOS customers of future constraints to their DOS
- The AESO will provide further details on the DOS application and contracting in the SASR process prior to the modernized DOS rate taking effect
- The AESO will not be prioritizing the development of a DOS capability map as part of DOS modernization

Recap of DOS Modernization Recommendation

- **Rate**
  - $/MWh conversion of DTS energy component
  - No expiry
  - Two types: Dispatchable and Term DOS
- **Qualification**
  - Standardized application process
    - Representation of DOS usage
  - Technical assessment of requested contract capacity
- **DOS usage and recall**
  - Managed through bids and merit order operation
- **Settlement**
  - Energy > DTS levels settled at DOS rate unless greater than 20 per cent
- **Audit**
  - Annual audit of representation and load factor

Questions?

Public

What We Heard from Session 6A Stakeholder Feedback

Public

Summary

- Primary comments from stakeholders in relation to AESO's preferred rate design were as follows:
  - Continued concern regarding allocation of costs to energy and demand using minimum system approach
  - Continued concern regarding recovery of energy related costs through flat energy charge
  - Continued questions on need for five-year average of 12-CP
  - Questions related to rate XOS and impact on exports

Comments with preferred rate design: Energy allocation

- Continued concerns with minimum system approach to allocate between demand and energy
  - Concern that methodology is not accounting for flows between areas appropriately
  - Questions regarding use of peak, net versus gross, or energy versus capacity
  - Concern that planning areas are arbitrarily defined
  - Concern about the allocation to demand and energy as a first step

Comments with preferred rate design: Flat energy charge

- Concerns with flat energy charge remain:
  - Concern that flat energy charge not consistent with time variation in use of transmission
  - Concern about impacts on long term response, incentives for self-supply / cost shifting
  - Concerns around cost for high load factor customers

Comments on five-year average 12-CP

- Questions about appropriate time horizon for calculation of 12-CP average (e.g.. One to five years)
- Concern about impact on DCG credits as a result of phasing in of five-year average
  - DFO calculation of DCG credits will need to recognize the transition of DCG credits

Comments on self-supply analysis

- Comments from stakeholders that:
  - Analysis should have included additional types of resources such as cogeneration/renewables/battery as a self-supply technology
  - Analysis needs to consider that one of the limitations on customers adopting self-supply is policy and tariff uncertainty
  - Analysis should be based on more recent average pool price
  - Analysis should consider impact of self-supply on pool prices
  - Assumption about carbon price limiting impact on self-supply needs to be tested
  - AESO should update delivered cost of energy report

Acknowledgement of feedback

- Your feedback has helped us understand your perspectives and where there are differences in views between stakeholders
- We will continue to consider your feedback in developing the application, including the process steps and issues list

Questions?

Public

Break

Public

Areas of Alignment

Public

Identifying areas of alignment and misalignment

- Areas of alignment and misalignment from our engagement process will be used to inform the AESO's application, including list of issues for adjudication by the Commission to improve regulatory efficiency
- Seeking your feedback on whether we have appropriately captured the areas of alignment and misalignment

Areas of alignment – rate design

- Tariff provides price signals that impact how customers respond
  - All transmission charges are avoidable to varying degrees by transmission customers
  - Degree of response, including self-supply, is important to understand the impact of the tariff
- Transmission charges should reflect the costs of providing transmission service
  - Transmission charges based on cost causation will lead to efficient outcomes

Areas of misalignment – rate design

- Timing and need for change
  - Await regulatory certainty and economic recovery versus now is the time for change
- Allocation of costs between demand and energy
  - Some concern about allocation between demand and energy as a first step in preferred rate design
  - Different views on minimum system approach to allocate between demand and energy
- Opportunities and incentives for response to tariff charges
  - Total impact and potential self-supply response is not the primary driver for tariff design, understanding of incremental impact relative to today

Areas of misalignment – rate design (con't)

- Difference of views on choice of appropriate billing determinants
  - Appropriateness of 12-CP: value response provides versus the costs response shifts to other customers
  - 5-year average 12-CP: questionable value and implementation consequences for sites versus better aligning billing determinant with cost drivers
  - Flat versus time of use or other shaped energy charge: reflecting the time variation in the use of the system vs the fact that the system supports the use of energy at all times
  - Un-ratcheted NCP: Fixed costs should be recovered on fixed charges versus cost recovery should primarily relate to the different ways the system is used

Areas of alignment & misalignment – Mitigation

Alignment:

- It is not in anyone's interest to reduce the number of ratepayers

Misalignment:

- Mitigation should be temporary to transition ratepayers to face new cost reflective rates vs mitigation should be permanent
- Varied views on how eligibility for mitigation should be determined: a percentage cost increase threshold, a total dollar impact threshold, phased-in rate changes, based on an economic impact assessment

Areas of alignment & misalignment – Energy Storage Treatment

Alignment:

- Energy storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter
- Energy storage can participate in Alberta's electricity use cases by providing energy price arbitrage, operating reserves, Non-wires solutions for transmission deferral
- Energy Storage should be treated in a FEOC manner

Misalignment:

- Treatment of energy storage when charging is like other consumers
- Feasibility of interruptible rates for storage and other grid users
- Applicability of DOS for energy storage is an improvement

Note: Areas of alignment and misalignment on DOS modernization will be identified following review of the July 9th feedback

Questions?

Public

Implementation Considerations

Public

Implementation considerations

- Contract capacity amendment period:
  - AESO will apply to the Commission to allow parties to adjust their contract capacity with the implementation of the new rates should they wish to do so
  - AESO will propose that any contract capacity amendments made during the rate implementation period will not be subject to the adjusted metering practice (AMP) requirements for contract capacity changes
    - the implementation of the AMP at such sites would align with the timing as approved by the Commission in the upcoming AMP Implementation proceeding
  - Payment-in-lieu of notice (PILON) would not apply to Rate DTS contract capacity amendments within the contract capacity amendment period
- DOS settlement reporting:
  - The AESO will develop settlement reporting to allow customers to track the use of DOS energy against the annual maximum load factor
- Minimum participation level for DOS will be reduced to 1 MW once the ISO rules are updated to enable assets under 5 MW to participate in the energy market
  - Change anticipated to occur as part of the Energy Storage ISO Rule Amendments

Questions?

Public

Next Steps

Public

Engagement schedule

- **July 9, 2021 |** Stakeholder feedback due on questions set out in Stakeholder Comment Matrix Session 6B
- **Late August/September 2021 |** The AESO will publish draft rate sheets for stakeholder review and written feedback
- **September 2021 |** The AESO will launch a survey to seek stakeholder input on the overall Bulk and Regional Tariff Design engagement process
- **October 2021 |** File application with AUC for public proceeding and approval

Session feedback

- We want to thank you for attending the Bulk and Regional Tariff Design Stakeholder Engagement Session 6B and we would appreciate your feedback on the session
- Launch Zoom poll
- We invite all interested stakeholders to provide their input on this session via the questions set out in the **Stakeholder Comment Matrix Session 6B on or before July 9, 2021**. The matrix will be available on June 17, 2021, on our website at www.aeso.ca
  - Path: Stakeholder Engagement > Rules, standards and tariff consultations > Tariff (filter) > Bulk and Regional Tariff Design > Session 6B | June 24, 2021

Rate sheets written consultation

- In late August/September 2021, the AESO intends to publish draft rate sheets for stakeholder review and written feedback
- **Purpose**
  - The purpose of the written consultation is to seek stakeholder input on the clarity and effectiveness of the draft rate sheets
- At that time, we invite all interested stakeholders to provide their input on the draft rate sheets via the questions set out in the Stakeholder Comment Matrix Rate Sheets.
- The draft rate sheets and associated comment matrix will be available late August/September and notice will be provided in our Stakeholder Newsletter and our website at www.aeso.ca
  - Path: Stakeholder Engagement > Rules, standards and tariff consultations > Tariff (filter) > Bulk and Regional Tariff Design

Overall engagement survey

- In September 2021, the AESO will launch a survey to seek stakeholder input on the overall Bulk and Regional Tariff Design engagement process. The survey will be available on our website at www.aeso.ca
- **Purpose**
  - The purpose of the survey is to seek stakeholder input on the overall engagement process for the Bulk and Regional Tariff Design engagement to guide us as we continuously work to improve how we engage stakeholders to ensure our approach allows stakeholders' needs and interests to be consistently, transparently and meaningfully considered
- At that time, we invite all interested stakeholders to share their perspectives on this overall engagement
  - Path: Stakeholder Engagement > Rules, standards and tariff consultations > Tariff (filter) > Bulk and Regional Tariff Design

AESO application and the AUC process

- The AESO will file an application with the AUC putting forward its preferred rate design on or before October 15, 2021
- The AUC will initiate a public proceeding following the filing of the AESO's application
- The AUC proceeding is a public process where registered participants are able to voice their concerns, objections or support and have them considered and understood before a decision is reached
- The AUC will decide whether or not to approve the AESO's preferred rate design based on what is fair, responsible and in the public interest
  - The outcomes of the targeted mitigation engagement will be tested by the AUC, who will make a decision on the overall rate design and any agreements on mitigation that are reached through the targeted mitigation engagement process
- Given the steps in the regulatory process, we anticipate the **earliest the new rate design would come into effect is 2024**

Appendix – DOS additional content

Public

Term Type DOS

- Condition for term type DOS - for scheduled maintenance of a generating unit where the market participant has planned maintenance of an on-site generating unit that normally supplies electric energy to an industrial process on the same premises; and would reduce the load of its industrial process in these circumstances rather than pay the cost of receiving additional electric energy under Rate DTS
- This DOS rate type continues to represent the full DTS charge in $/MWh and is intended to allow short-term usage at less than the full cost (including ratchet) of Rate DTS but would be significantly more costly than Rate DTS for long-term or more frequent usage.

Monthly settlement of DOS considering annual maximum load factor alternative example

- January and February has unused DOS energy under the maximum load factor and that DOS energy carries over into March (33 + 192 = 225 MW)
- In March, customer exceeds the monthly allowable DOS energy plus the carry-over DOS energy by 287 MWh (512 minus 225). That volume is settled at DTS surcharge rate
- In April, the customer uses no DOS energy and is credited back the DTS surcharge amount, and the unused energy balance becomes 1440 – 287 = 1153 MWh for use in May

	Description	Jan	Feb	Mar	Apr	May
DOS Contract capacity (MW)		10	10	10	10	10
Monthly Allowable DOS Energy (MWh)	hours in month x contract capacity x 0.2	1488	1392	1488	1440	1488
DOS Energy used (MWh)	energy above DTS contract capacity	1455	1200	2000	0	1494
Monthly Energy below (above) Monthly Allowable DOS Energy	Negative – monthly use exceeded monthly allowable; Positive – monthly use was below monthly allowable	33	192	-512	1440	-6
DOS charges ($15/MWh)	Min(DOS Energy Used, Monthly allowable) x $15/MWh	-$21,825.00	-$18,000.00	-$22,320.00	$0.00	-$22,410.00
Monthly DTS surcharge energy used (or credited) (MWh)	The energy applied at the DTS surcharge rate	0	0	287	-287	0
DTS surcharge or credit ($110/MWh)	Monthly DOS surcharge or refund	$0.00	$0.00	-$31,570.00	$31,570.00	$0.00
Total charges or credit ($)	DOS charges plus DTS surcharge or credit	-$21,825.00	-$18,000.00	-$53,890.00	$31,570.00	-$22,410.00

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Company Representative
Comments From:	Company Name			**Phone:**	Contact Phone Number
Date:	[yyyy/mm/dd]			**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	
7.	Do you have any further implementation considerations the AESO should consider?	
8.	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	The ADC did not find the session valuable. The AESO should have spent time providing the detailed cost of service study and supporting in depth analysis on the tariff proposal. Support for the 2014 tariff application had a comprehensive cost of service study with supporting cost tables prepared by London Economics. The study included different options for cost recovery and rationale supporting the recommendations. The AESO has provided nothing by way of comprehensive material to support the preferred rate design or the modernized DOS recommendation. Further the mitigation options are not workable for energy intensive trade exposed companies that wish to remain competitive in Alberta for the long term.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	The AESO has clearly set it's mind to their preferred tariff proposal and seem unwilling to examine any areas of misalignment with a goal of achieving a collaborative approach that can both recover costs in a fair manner while at the same time not force high load factor and price responsive customers to exit the grid.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	The ADC could support in principle a modernized DOS, but does not support the AESO recommendation.
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	The main concern about the moderninzed DOS recommendation is that it provides no long term assurance that a customer can receive power at their site, even where those customers have been on the system for decades. A company cannot invest capital in a manufacturing facility where they have no certainty of long term supply. Price responsive loads can interrupt for several hundred hours per year, but ultimately without some level of power supply they cannot make their product. Further the 20% load factor number essentially makes this product not work for any manufacturuing facility unless they have on site generation. There needs to be a different option – somewhere in between the DOS proposal and the firm DTS service where energy intensive and trade exposed industry can receive reliable, but interruptible power from the transmission system.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	No.

6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	The ADC in not supportive of the targeted mitigation outcomes. The AESO options for mitigation are only run to failure options. The choices put forward to the impacted parties are do you want to exit the grid in year 1 or have 5 years to plan your exit. This outcome does not serve the impacted parties or the public interest.
7.	Do you have any further implementation considerations the AESO should consider?	The AESO consultation process on the tariff design has been extremely dissapointing for ADC members. ADC has contributed significant time and effort in working with the AESO since 2018. To get to a point where our members options to stay viable in Alberta are to pursue on-site generation or exit the province is in our view a failure of the AESO process.
8.	Additional comments	Alberta has significant and material issues to tackle in our electricity system. Addressing carbon policy, integration of renewables, volatility and reliability are all significant challenges that need urgent attention. Implementing this rate change at this time, where it will clearly need to change again as an outcome of a needed policy update, is unnecessarily disruptive with the added negative impact of freezing industry investment in Alberta. The AESO should approach Government to say a pause is necessary while these other matters are addressed.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Hao Liu / Rob Senko
Comments From:	AltaLink Management Ltd.			**Phone:**	403-710-1247 / 403-874-6762
Date:	2021/07/09			**Email**:	Hao.liu@altalink.ca / rob.senko@altalink.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	The session held on June 24, 2021 was of assistance in that the AESO provided their implementation considerations.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	AltaLink disagrees that there is stakeholder alignment regarding "Transmission charges should reflect the costs of providing transmission services" (slide 71). Transmission charges should reflect both the costs and benefits of providing transmission service. As this was the last stakeholder session for the AESO's rate design process it would have been useful for the AESO to summarize all topics that have been raised throughout the stakeholder engagement process not just was captured in the Session 6B presentation.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	c) Undecided
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	Nothing more than what AltaLink provided in the May 28, 2021 comment matrix.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	No.
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	c) Undecided
7.	Do you have any further implementation considerations the AESO should consider?	Not at this time.
8.	Additional comments	None.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Rick Cowburn
Comments From:	CWSAA – Vidya Knowledge Systems	**Phone:**	(403) 397-8785
Date:	2021-07-09	**Email**:	rcowburn@vidya.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	Thanks to the AESO for its ongoing pursuit of stakeholder understanding and alignment. As least the parties should be relatively clear as to what the AESO is proposing -- subject to concerns identified below.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Not supportive. The industry has been down this path before (in the 1980's), providing discounted rates in a time of surplus, which only shifts costs and saves nothing. The bulk system has been built, and generation (not load) is forecast to drive future expansions. Without clear and rigorous admission criteria, the DOS rate will be flooded by applicants whose risk of physical interruption may well be minimal. The proposed solution is a customer representation that "use of Rate DOS will enable consumption that would be uneconomic and would not otherwise occur under Rate DTS." No business case or other standard documentation is proposed, leaving DOS users uncertain as to the case they would have to meet in the event of an AESO audit. A customer 'thrown off' DOS would have every reason to litigate the AESO's decision, which would be difficult indeed if there was no clear, quantitative definition of 'uneconomic consuption'. Alternatively, the AESO could avoid the issue by never making a finding re: 'uneconomic consumption'. No one outside of the AESO will know whether the business case was solid, liquid or gas. Problem solved… No doubt the AESO would try to do the right thing, as it does; but this sloppy approach is just setting the AESO up for failure, and creating yet another program that, like 12CP, will predictably grow to become a massive, locked-in subsidy that cannot be removed without severly disrupting the businesses that will have come to depend on it. Can we not learn from past mistakes?
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	This is not "tariff modernization" – this is essentially a "Non-firm interruptible rate class not accepted by AESO as a feasible alternative." Using this a part of a mitigation plan would add enormous complexity to an already difficult situation.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	Unfortunately not. Opening up DOS in a system surplus situation is a bad idea for customers unable to play the game, and would lock in yet another unjustifiable subsidy that will be painful to remove when its folly grows too obvious.

6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Supportive of a clearly defined, limited time bill credit approach, subject to implementation clarifications (see below). The AESO proposed the following formula (slide 6B-22) Credit on Energy Charge = ((Annual Transmission Costs [under 2019 ISO tariff rates] X 110%) – . (Annual Transmission Costs [under AUC approved design])) / . (Energy [2019 Site Actual Energy] X . Energy Charge [under AUC approved design]) The Credit is expressed as $ / MWh (see slide 6B-26 “Average Year 1 Credit of $3.30/MWh (Declining annually)”) A. OBSERVATIONS re: CREDIT FORMULA The basic equation is clear: [i] Reprice current period consumption under the 2019 tariff, multiply result X 110% [ii] Calculate current period transmission costs under AUC approved design [iii] Dollar Credit = ([i] – [ii]) (declining annually) The calculation is presumably done after the fact, based on actual electricity use in the period. It is not clear why it is necessary to convert this into a $ / MWh rate, particularly considering that this rate will be different for each mitigated site. If the purpose is to avoid the appearance of a subsidy, a legal opinion would be essential; it is hard to believe that such a superficial subterfuge would actually be legally effective. The purpose of the “Energy Charge [under AUC approved design” is unclear. The units of the result, the ‘Credit on Energy Charge’, are $ / MWh, so one would expect a numerator in units of $, and a denominator in units of MWh. A denominator of Energy (MWh) times Energy Charge ($/MWh) would have units of . $ X (MWh/MWh) = $, which makes no sense.

		B. USE OF 2019 ISO TARIFF FOR MITIGATION CALCULATIONS: The ISO tariff will likely increase by some amount every year. Calculating mitigation based on the 2019 tariff would materially increase the mitigation amounts paid and eliminate rate volatility. Assessing the magnitude of this additional mitigation amount would be important in assessing the fairness of the calculation. While it maybe reasonable to shield certain PODs from tariff structure changes, changes in tariff levels should equally impact all parties (as flowed through the standard tariff). A reasonable alternative would be to annually recalculate a 'reference tariff' to be used in this calculation, updating only the cost information but retaining the current allocation process. C. CAPPING CURRENT PERIOD CONSUMPTION DATA The policy objective of mitigation is to reduce the impacts of a change in the transmission tariff structure on current customers. The policy is intended to be discriminatory, effectively penalizing new loads compared to otherwise identical existing loads. It would not be reasonable to provide this credit to <u>any</u> new loads, whether or not they are on an existing site. (The alternative of providing this credit to <u>all</u> new loads appears infeasible.) One way of implementing this would be to set a cap on the 'current period consumption data' used in the mitigation calculation, such that peak demand used in that calculation cannot exceed past historic levels (say from 2017 to 2019). D. SCOPE OF MITIGATION CALCULATION – UNDUE DISCRIMINATION Most customers receive transmission charges through a distribution utility; only a limited number of PODs / customers happen to be directly invoiced by the AESO (EUA 101(2)). These PODs / customers are visible to the AESO. The AESO is understood to be proposing to allocate the costs of this mitigation across all other transmission system users (although the specific mechanism for this back-allocation of credits does not appear to have been provided as yet.) Other customers deal with the local distribution utility, but receive a flow-through of the AESO tariff (e.g. FortisAlberta's Rate 65, ATCO Electric's Rate T31, ENMAX Power's Rate D700, EPCOR Distirbution & Transmission's Rate SAS-DC). It is not clear that these PODs / customers are included in the AESO's mitigation calculations, as they do not deal directly with the AESO. If these 'flow-through' sites **<u>are not</u>** included in the mitigation program, there is arguably undue discrimination compared to AESO direct connect sites, in that physically identical customer supply situations may be treated quite differently.

		If these distribution 'flow-through' sites **are** included in the mitigation calculation, then the AESO needs to know the specifics of the distribution utility's arrangements at each POD. If a single customer is served by a POD, then it receives mitigation payments; if two or more customers are served by a POD, then there are no mitigation payments. From the AESO's perspective, this certainly looks like undue discrimination. The AESO serves Points Of Delivery. Customers would have every reason to be upset that their competitor down the road receives mitigation payments, but because they share a POD their otherwise identical load does not generate any mitigation payments that could be flowed through to them by the distribution utility. A reasonable solution that respects the industry's legal structure might be for the AESO to implement the mitigation program at the POD level, without discriminating as to how that POD bill is paid for. If the POD serves a distribution utility, its treadment will be considered in the appropriate distribution utility proceeding; if a POD serves a non-utility, that party determines what should be done.
7.	Do you have any further implementation considerations the AESO should consider?	It would be helpful for all if the AESO provided numeric examples of its proposed resolution of the calculation details of its mitigation program. How does the AESO have the authority to negotiate a "Memorandum Of Understanding" that is in any way binding on the Commission, particularly when it was arrived at without broad stakeholder involvement? The purpose of creating and parties 'signing off' on such a document is unclear indeed.
8.	Additional comments	Best wishes to all in this difficult process.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment: June 17, 2021 through July 9, 2021	**Contact:** Leonard Olien
Comments From: CanREA	**Phone:** 587-971-0049
Date: July 9, 2021	**Email**: lolien@renewablesassociation.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	The session was valuable. The session would have been more helpful if there had been examples prepared to illustrate how the proposed must-bid provision in the modernized DOS service will interact with the proposed rules for energy storage participation in the energy and anciallary services markets.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	In general, CanREA is supportive of the revised DOS modernization recommendation. Specific concerns are addressed in Q4.

4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	CanREA is concerned by certain comments made during the meeting relating to the use of modernized DOS and participation in Ancillary Services markets. The current DTS treatment of energy storage is an economic barrier to AS and energy market participation, and therefore, the use of a DOS contract should not affect the ability of a resource to participate in the AS market. Rather it is the responsibility of the market participant to ensure that the resource is prepared to respond to any AS obligations. Any provision from AESO on energy storage regarding participation in the A/S market would be discriminatory as fuel supply certainty is not a qualification for other energy sources CanREA understands that the 20% capacity factor limit is in place to minimize the risk of migration from DTS to DOS. The 20% limit is likely to be a restriction on long duration energy storage which ultimately results in unfair treatment. CanREA maintains that a higher limit would continue impede migration to DOS from DTS while removing the unfair barrier to long-term energy storage participation in the market. CanREA supports the change from requiring a participant to submit a business case to requiring a simple representation. CanREA maintains that a statement such as “The asset is an energy storage facility” should: a) Be a sufficient assertion for any given energy storage resource to qualify for the modernized DOS b) Preclude any need for further evaluation of the resource operational behaviour beyond calculating the capacity factor c) Remove the risk that the storage resource would lose access to DOS except for repeated failure to follow dispatch instructions to curtail withdrawls from the grid.

5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	CanREA would like the AESO to prepare some examples of how the must-bid provision of the modernized DOS would interact with the recommended market rules for the participation of energy storage and hybrid resources in the energy and AS markets. CanREA would like clarification that the use of a DOS contract does not preclude a storage resource from participation in the AS markets. CanREA would like to see modelling to justify a capacity factor value that is based on future behaviour and includes consideration of long-duration storage. CanREA would like to know the smallest DTS volume that can be contracted for. The number 0.1 MW was mentioned verbally.
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	
7.	Do you have any further implementation considerations the AESO should consider?	CanREA understands that the AESO will file for the modernized DOS with the AUC along with the revised Bulk and Regional Tariff which will lead to expected implementation date in 2024. Given the exceptional growth in energy storage deployment in other jurisdictions, CanREA is concert about the time lag in implementing the modernized DOS and the negative impact on potential investment. CanREA looks forward to further discussions with the AESO to identify regulatory efficiencies that can lead to an earlier implementation for the modernized DOS.
8.	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Matthew Davis
Comments From:	Capital Power			**Phone:**	403.540.6087
Date:	2021/07/09			**Email**:	mdavis@capitalpower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	Capital Power appreciates the opportunity to provide comments on the June 24, 2021 stakeholder session. The session was valuable in that it allowed for further discussion on the AESO's DOS modernization plans and provided an update on AESO activities prior to filing its preferred bulk and regional tariff design. At the session, the AESO was unable to answer some stakeholder questions, but indicated that they would take away those questions to have them answered. While it is preferable to have questions answered in the session, Capital Power appreciates that not every answer is readily available and thus appreciates the AESO following up with session attendees and other market participants with answers. The areas of alignment and misalignment have been clear through the process, particularly once the AESO provided its preferred design. While Capital Power appreciates the AESO's compilation of the areas of alignment and misalignment, the effort has not added materially to Capital Power's understanding.

	Questions	Stakeholder Comments
		Capital Power did find the session particularly useful in hearing additional details on the AESO's DOS modernization proposal. Capital Power re-iterates that the pace of this development over the past few months could have supported additional engagement. Capital Power appreciates the AESO's update on the mitigation options and the efforts to provide insight into the process.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	Capital Power believes that the AESO has adequately articulated the areas of alignment and misalignment for the bulk and regional tariff design. The AESO has not though provided as much qualification as to the degree of which participants are misaligned with the AESO's preferred design.
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	While Capital Power is supportive of general framework the AESO is proposing for DOS modernization, it is less supportive of certain details, and in some cases not supportive of it at all. Specific concerns are highlighted below. Capital Power is somewhat supportive of the qualification process for DOS occurring as part of the connection process. The AESO's comments in the session that it could occur around stage 2 of the process is positive as Capital Power believes that having clarity on the tariff treatment early in that process is essential for project development. While Capital Power understand that is subject to further determination, it appreciates this opportunity to indicate where in the interconnection process it should occur. As outlined in Capital Power's previous comments (session 5B), it is not supportive of the load factor limitation for energy storage as it creates level playing field concerns. Capital Power would note that the AESO's representation requirements, while an improvement over the business case, does not necessarily reduce the effort required by market participants. Further, the AESO's monitoring actions as drafted, create risk to project developers should DOS be revoked.

	Questions	Stakeholder Comments
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	Please see Capital Power's response to 3 above.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	Capital Power would appreciate the AESO following up on its question from the stakeholder session. Specifically: *On slide 26, the AESO indicated transition DOS over the 20% LF would cost $17M for 5 years. Is it possible to share what the maximum load factor the AESO calculated was required for this mitigation option and result?*
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	At this time, Capital Power is undecided on its support for the targeted mitigation approach being taken by the AESO. While Capital Power does view modernization of DOS as a potential mitigating rate design, the temporary nature of the allowances may be less than ideal. Capital Power remains supportive of rate design measures, which DOS could be construed as, over billing adjustments, which is the AESO's other alternative.
7.	Do you have any further implementation considerations the AESO should consider?	Capital Power has no further comments at this time.
8.	Additional comments	Capital Power has no further comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Blair Wood
Comments From:	ConocoPhillips Canada			**Phone:**	403 532 3575
Date:	2021/07/09			**Email**:	Blair.Wood@conocophillips.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	(i) Yes the session was valuable. (ii) a. Yes b. Yes c. Yes
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	NA

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	NA
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	NA
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	NA
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	b)
7.	Do you have any further implementation considerations the AESO should consider?	The AESO is using a 10% bill impact on transmission as a qualifying measure for mitigation. Conoco would recommend changing the mitigation such that a market participant would only qualify if a bill impact for transmission and energy combined is greater than 10%, as per the normal AUC practice.
8.	Additional comments	NA

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Raj Retnanandan
Comments From:	Consumers CoaliTion Of Alberta	**Phone:**	Contact Phone Number
Date:	[2021/07/09]	**Email**:	

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	Please refer to 3 below.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	Please refer to 3 below.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	CCA is not supportive of the proposed DOS rate as it does not require a business case that would demonstrate the economic rationale for a customer choosing the DOS rate. CCA is concerned that the AESO's DOS proposal could result in erosion of firm service billing determinants, potentially resulting in higher rates to residential customers.
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	CCA submits the proposed DOS rate is fundamentally flawed as it appears to violate the cardinal principle that the DOS rate should be for temporary use of energy transactions that would not otherwise occur.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	None
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Not supportive. CCA does not support the targeted mitigation engagement because the DOS rate that is the centrepiece of this effort is fundamentally flawed and could result in erosion of firm billing determinants.
7.	Do you have any further implementation considerations the AESO should consider?	Not applicable
8.	Additional comments	None

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Christine Runge (Power Advisory)
Comments From:	DCG Consortium The DCG Consortium is comprised of the following members: BluEarth Renewables Inc., Canadian Solar Solutions Inc., Elemental Energy Renewables Inc., RWE Renewables Canada Holding Inc. and Siemens Energy Canada Limited. This submission represents the consensus view of the group and is submitted on behalf of the group by Power Advisory LLC	**Phone:**	403-613-7624
		Email:	crunge@poweradvisoryllc.com
Date:	2021-07-09		

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	
7.	Do you have any further implementation considerations the AESO should consider?	

8.	Additional comments	The DCG Consortium notes that its concerns about the five-year average 12CP calculation were recorded on slide 64, however, these concerns were not addressed or responded to. The DCG Consortium would like to reiterate that it is important the questions and comments raised are responded to in the AESO's filed application in order to avoid the additional regulatory burden of the DCG Consoritum asking the same questions in IRs and filing the same mathematical comments in evidence. For our complete comments on these matters, please see the DCG Consortium comment matricies in response to Session 5 and Session 6A.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Justin Rangooni
Comments From:	Energy Storage Canada			**Phone:**	647-627-1815
Date:	2021/07/09			**Email**:	jrangooni@energystoragecanada.org

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	Energy Storage Canada (ESC) found Session 6B valuable. The AESO provided further details on the proposed Modernization of Demand Opportunity Service (DOS) rate design and how energy storage would be incorporated. Further, the AESO provided time to answers clarifying questions for ESC members and ESC. ESC did receive additional clarity on both a & b; ESC has limited interest in c.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	An area of misalignment that has not been listed for energy storage is that DOS rate design should be technology agnostic. As noted in areas of alignment, energy storage is unique. Requiring a technology agnostic rate design for both energy storage and price sensitive load customers does not recognize and support the uniqueness of energy storage. The AESO should explore additional adjustments to the modernized DOS to support energy storage. In particular, if the AESO is going to pursue modernizing the DOS as the preferred treatment for energy storage; the AESO should include specific treatment for energy storage in the DOS rate design that reflects the uniqueness of energy storage.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Undecided. The modernized DOS rate framework provides a support in many key areas for energy storage resources including recognition that energy storage's use of the transmission system is opportunistic. On the other hand, the access to an opportunity rate based on the AESO's sole judgement of project economics is inappropriate and does not reflect the multiple areas where energy storage is unique (e.g., storage consumption does not lead to transmission network build-out, storage participates as a generator in the wholesale energy market, etc.).
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	ESC has concerns with the DOS modernization recommendations. First, the maximum load factor proposed by the AESO may not be supportive of long duration energy storage resources. The AESO should consider a slightly higher maximum load factor. Second, the AESO has stated that integrating energy storage into the bulk & regional tariff design is a priority. The eligibility requirements for the modernized DOS rate proposed by the AESO based on project economics is short-term and does not provide a permanent solution to energy storage needs. Energy storage does not need firm capacity and must be offered a permanent option for an opportunity service similar to the XOS rate. Finally, the proposed approach of customer representation followed by detailed audit to seek out misrepresentation is not appropriate and should be removed from the modernized DOS rate.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	The AESO has stated that customers can select their DTS amounts that is required to receive DOS rate. Will storage be allowed to select their DTS amount without quantification or approval by the AESO? For energy bidding; can the AESO provide an example for hybrid facilities (e.g., storage + solar)? It is unclear how a DOS recall that may occur due to a regional transmission system constraint may impact the market operation of hybrid projects.

6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	No comment from ESC
7.	Do you have any further implementation considerations the AESO should consider?	AESO should re-consider capability maps for DOS availability. System capability heat maps are produced by Alberta Distribution Facility Owners (DFOs) that provide guidance for connection capability without significant investment in resources. A similar approach during the Long-Term Outlook (LTO) or other system planning processes should be considered by the AESO. For example, the AESO has published a Transmission Capability Assessment for renewable generation over the past few years, a similar document could be developed for DOS capacity. Guidance on where in the transmission system excess capacity is greatest provides market participants with valuable input in assessing risks and rewards in siting resources.
8.	Additional comments	ESC continues to have questions understanding the volatility of the preferred rate design. Can the AESO provide example calculations of the Functionalization Ratio for 2015 to 2020 and into the future based on the LTO 2021? ESC has expressed interest in understanding how the XOS rate will change with the preferred rate design. Can the AESO describe if any eligibility criteria will change as part of the Bulk & Regional tariff design?

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Mark McGillivray
Comments From:	ENMAX Corporation			**Phone:**	
Date:	2021/07/08			**Email**:	MMcGillivray@enmax.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	The session was helpful. ENMAX looks forward to viewing the AESO Tariff application.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	No comment.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Undecided. Further details would be required on how the market rules would work. A new purpose-built rate for all types and sizes of storage is preferred compared to retrofitting an existing mechanism.
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	Requiring DOS load to bid into the energy market and comply with ISO rules 24x7 may inadvertently be a barrier for smaller energy storage projects to participate.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	See response to Question 3.
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	ENMAX has had limited visibility of the AESO's targeted mitigation engagement and outcomes, but overall, supports efforts to reduce impacts to those customers facing a large rate shock increase. A gradual introduction of the new rates should be considered for all customers to reduce the rate shock. It is important to note that mitigation actions and outcomes should not significantly shift costs on to other participants, and it is unclear at this point if this will be the case in the AESO proposals.
7.	Do you have any further implementation considerations the AESO should consider?	Further clarity would be required on the timing of implementation for the proposed DOS modernization and how this would align with the AESO's energy storage roadmap and upcoming consultation process to amend various ISO rules.

8.	Additional comments	On slide 64 of the AESO's presentation, the AESO indicated that there was a concern about the impact on DCG credits as a result of phasing in the five-year average and that the DFO calculation of DCG credits will need to recognize the transition of these credits. ENMAX requests more information on this particular comment and the impacts to a DFO's calculation as DCG credits are phased out.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Gerald Zurek
Comments From:	EPCOR Distribution & Transmisson Inc	**Phone:**	780-686-1186
Date:	2021/06/30	**Email**:	gzurek@epcor.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	EDTI found the session valuable to help understand the DOS rate. Yes Yes Yes
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	None that EDTI is aware of.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Undecided
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	None that EDTI is aware of.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	No
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Undecided
7.	Do you have any further implementation considerations the AESO should consider?	No
8.	Additional comments	EDTI has no additional comments.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Jordan Balaban
Comments From:	Greengate Power			**Phone:**	403 930 1300
Date:	2021/07/09			**Email**:	jordan@greengatepower.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	i) It was a valuable session to understand the AESO's intended design for its upcoming tariff. It would have been useful to participants, as the AESO's filing date gets closer, to have more details on the implementation features of DOS. ii) a) Yes. b) Yes. c) Yes.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	NA

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	b) Somewhat supportive. Greengate is supportive of using DOS for energy storage assets. Greengate remains concerned over the level of the proposed DOS rates and seeks further clarity on the required declaration.

4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	**Concerns**. Greengate has ongoing concerns with the following aspects of the DOS modernization recommendation: **1**. **Variable Energy Charge**. Since the basis of the proposed DOS rate includes all energy charges, the DOS rate has increased substantially with the AESO's proposed rate design. It is not clear how the AESO has drawn a cost causation link between the impact of a DOS asset connecting and the proposed variable energy charge since the variable energy charge is derived from costs that are fixed. Greengate recommends revising the preferred rate design to mitigate or eliminate the artificial variable energy charge, such that DOS rate does not include a charge that it does not cause. 2. **Back-Charge Risk**. The AESO will not require a business case submission (i.e., proof that DTS is not economic) to qualify for DOS. However, market participants can be left with substantial risk in choosing to apply for DOS since at a later date, the AESO may reassess the application and back-charge DOS customers with DTS rates. The AESO should clarify this issue by specifying the calculation details regarding the economics on the DTS evaluation. 3. **Declaration to Qualify**. Similarly, it is not clear what commitment will be made when executing the declaration to qualify. It is also not clear what period the declaration should be intended to cover. These details must be clear prior to the AESO's filing its proposed tariff. **Support**. Greengate generally supports the AESO's recommendation to allow **customers to determine their DTS contract level**. During Tariff Session 5B, numerous stakeholders opposed the AESO's position that energy storage assets must include a portion of the charging volume under the asset's Rate DTS contract. It is understood and accepted that an energy storage facility will have a DTS contract for the auxiliary loads required to operate an asset, which is common practice for generating facilities interconnecting into the AIES. Regarding DTS rate and DOS rate contract levels, Greengate supports the AESO's revised recommendation

		that “the customer will determine the appropriate contract capacities and assume the risks of such contract levels” as relates to recall risk.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	How does the AESO justify that a DOS asset should be charged the high variable energy charge from a cost causation principle perspective? How will market participants that intend to declare an asset as eligible for DOS properly support their AESO declaration? What details will be included in the DOS declaration? What is the specific wording of the declaration? What period will the declaration be binding? How will the AESO determine the accuracy and eligibility for DOS based on the declaration? How will the AESO determine compliance to DOS eligibility requirements on an ongoing basis after an asset qualifies?
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	NA
7.	Do you have any further implementation considerations the AESO should consider?	NA
8.	Additional comments	NA

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Kurtis Glasier
Comments From:	Heartland Generation Ltd. (“Heartland Generation”)	**Phone:**	(587) 228-9617
Date:	[2021/07/09]	**Email**:	Kurtis.Glasier@heartlandgeneration.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	Heartland Generation found Session 6B, hosted on June 24, 2021, to be valuable. Session 6B provided additional clarity, specifically on the proposed targeted mitigation engagement. The mitigation options have been less transparent up to this point for those not directly engaged.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	Heartland Generation disagrees with the AESO's characterization of alignment with the point, "Energy Storage is unique in that it is not the producer or the end consumer of electric energy, nor is it the transmitter." Heartland Generation does not view Energy Storage as unique, from the perspective of Tariff treatment. Energy Storage would likely benefit from an opportunity service rate structure, as its characteristics resemble that level of service; however, this should not be a unique rate for energy storage specifically, and should be available to other tariff customers that qualify. The AESO could better encapsulate this misalignment by stating that some participants view storage as neither the originator nor end consumer of electric energy, while other participants view energy storage as *both* the consumer (especially given process losses of storage) and producer of energy during a different time period. As both a producer and consumer of electric energy, energy storage should be eligible to participate in all sectors of the electricity market for which they meet the technical qualifications.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Heartland Generation is somewhat supportive of DOS modernization. The proposed DOS modernization is an improvement over the existing rate DOS.
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	The proposed changes do not seem to adequately address customers desire for an interruptible service or opportunity service rate. Heartland Generation has detailed a description of how an efficient DOS rate could be defined and developed in its response to Session 5B (specifically, Question #3 in the previous comment matrix).
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	Heartland Generation understands the DOS modernization recommendation. However, it seems to have limited use cases for specific customers. It would be helpful if the AESO could provide the types/categories of customers they anticipate using rate DOS in the future and how this rate better meets their needs; this is especially relevant given the very low utilization of the current rate DOS.
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Undecided. Heartland Generation is not sure what the benefit to the Memorandum of Agreement (MOA) for a select number of chosen participants will be. The mitigation options discussed seem to all imply that the costs of the mitigation is not revenue neutral; this means that customers not signatory to the MOA will be responsible in part for funding the mitigation options.

7.	Do you have any further implementation considerations the AESO should consider?	The AESO published new rate estimates on July 7, 2021, which includes projections for rate XOS/XOM. This spreadsheet shows rate XOS/XOM almost doubling from the current $8.28/MWh to ~$15/MWh. This is a significant increase to a single rate class that has not been included in the current consultation or targeted mitigation discussions. In the same way that the AESO proposed to modernize rate DOS, the AESO should examine and consult on whether or not the methodology to calculate rate XOS/XOM should likewise be updated/improved.
8.	Additional comments	Heartland Generation remains concerned about the broader context of a significant tariff redesign at this time, with so many uncertain policy issues (e.g., the forthcoming *Transmission Regulation* expiry and possible fulsome review, the outstanding policy direction and/or legislative changes regarding self-supply and export, the alignment of transmission and distribution interconnections/tariffs, and the distributed generation credits methodology). There is a massive confluence of related and impactful changes in the electricity industry, and the timing due to operational/commercial pressures from COVID-19 could not be worse. The AESO should seriously consider whether a tariff design overhaul should be tabled until more of these policy/regulatory issues have been settled. As things are, it may be within the public's best interest to maintain the current bulk and regional tariff design.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Vittoria Bellissimo
Comments From:	Industrial Power Consumers Association of Alberta (IPCAA)	**Phone:**	403 966 2700
Date:	2021/07/09	**Email**:	Vittoria.Bellissimo@IPCAA.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	(i) The session was valuable. (ii) Yes.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	The AESO has covered the areas of alignment and misalignment at a high level.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	d) Somewhat not supportive. This will likely work for energy storage projects; however, the 20% load factor requirement continues to be a concern for load customers. Given this requirement, it is clear that DOS is strictly targeted at energy storage projects, not at Alberta industrial loads. Ultimately, the solution to Alberta's high transmission costs is load growth and this proposal does nothing to encourage or enhance load growth.
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	As stated previously, the 20% load factor requirement continues to be a concern for load customers. The AESO did not provide any analysis on the selection of the 20% restriction nor the rationale besides a qualitative statement. It would be helpful for customers to see the analysis that contributed to this recommendation. IPCAA is concerned with the availability of DOS service over a longer time period. For example, when load grows in an area and transmission capacity becomes constrained, making DOS unavailable. This risk and the lack of information about this risk may make the DOS option much less appealing for customers – which is especially problematic for customers who cannot afford the proposed increases in Rate DTS. Customers do not have any visibility as to when the system is anticipating stress in the area (unless they complete a routine system study which could be expensive).
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	Please see above. No additional questions at this time.

6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	e) Not supportive. It is difficult to understand why a company would sign this MOA. IPCAA is concerned that these mitigation options only offer a run-to-failure option for some of these customers. As stated previously, our long-term goal should be increasing load in Alberta. How does this help us achieve this goal?
7.	Do you have any further implementation considerations the AESO should consider?	N/A
8.	Additional comments	As stated previously, the AESO should be exploring tariff options from other jurisdictions that could potentially grow load in Alberta.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Sharmen Andrew
Comments From:	MATL Canada / MATL LLP	**Phone:**	403-818-0058
Date:	2021/07/09	**Email**:	sharmen.andrew@bhe-canada.ca

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	Session 6B was helpful, and provided further clarity on agenda items.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	Further consultation may be required to understand the areas of alignment and misalignment relative to export opportunity services.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Not supportive. There are unanswered questions about the impact of DOS modernization and the preferred rate design on energy exports. There is a concern that the net increase in export costs could be unfair and disproportionate to the net increase in DOS costs.
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	The Estimated Rate Calculations Toll v0.2 published on July 7, 2021 by the AESO confirms that XOM/XOS costs will increase by more than the 10% threshold set by the AESO, and it does not appear that there has been consultation with stakeholders that predominantly utilize XOM/XOS services. There is a concern that DOS may be treated prefentially to XOM and XOS, specifically during the transition period. MATL is unaware of any mitigations being proposed for stakeholders that are impacted by rate changes to XOM/XOS services.

5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	1) MATL understands that the new tariff redesign will increase the cost of exporting energy from Alberta (i.e., through higher XOM/XOS charges, or additional charges beyond XOM/XOS). MATL has the following questions that need to be answered:: a) How will the AESO determine the new XOM/XOS rate, and/or other charges? The AESO has provided a calculator on July 7, 2021. Please provide an example calculation in an excel spreadsheet(with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. Please demonstrate all potential impacts to XOM/XOS within the calculator and explain how it may impact MATL and its customers. b) Will the cost increase be higher or lower when compared to services that are are recalled after XOM/XOS such as DOS? Please provide an example calculation in an excel spreadsheet (with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff, including proposed mitigations. c) The AESO has assumed in its rate calculator that the export volumes will be 130,000MWh in the future. Please explain the basis for this amount and how the AESO assessed the amount of export volumes that will result from higher XOM/XOS rates? Please demonstrate the reduced exports that will result from an increase in the XOM/XOS rates. Please provide an example calculation in an excel spreadsheet(with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. d) Is the AESO expecting an overall reduction in offsets from export opportunity service revenue? If so, by how much? e) Please list and fully explain all mitigations that will be put in place by the AESO for stakeholders impacted by the increase in XOM/XOS charges? Please also list and fully explain all mitigation that will not be put in place by the AESO and the reason for them not being considered? f) Non-firm interruptible rate class was not accepted by the AESO for DOS mitigations as described in the Session 6B on June 24, 2021. Given that XOM/XOS is already a non-firm interuptable rate class, please explain if revisiting the method for calculating XOM/XOS charge would avoid adverse impacts to exports?

		Please explain the impact if the AESO tariff were to provide firm transmission service for XOM/XOS services. 2) Will the new tariff redesign increase the cost of importing energy into Alberta (i.e., through higher IOS charges, or additional charges beyond IOS)? If yes: a) How will the AESO determine the new IOS rate, and/or other charges? Please provide an example calculation in an excel spreadsheet(with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. b) How has the AESO assessed the reduced import volumes that will result from higher IOS rates? c) With respect to the AESO's existing and future practices of operating international cross border interties, has the AESO considered compliance to the United States-Mexico-Canada Agreement (USMCA)?
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Not supportive. There are unanswered questions about the impact of DOS modernization and the preferred rate design on energy exports. There is a concern that the net increase in export costs could be unfair and disproportionate to the net increase in DOS costs.
7.	Do you have any further implementation considerations the AESO should consider?	The AESO should consider mitigations for XOM/XOS as has with DOS. There are unanswered questions about the impact of DOS modernization and the preferred rate design on energy exports. There is a concern that the net increase in export costs could be unfair and disproportionate to the net increase in DOS costs.
8.	Additional comments	MATL Canada / MATL LLP requests that the AESO consult with MATL and its customers on the proposed changes to XOM/XOS rates, as it appears that they will be materially impacted beyond the 10% threshold set by the AESO.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Horst Klinkenborg
Comments From:	Suncor Energy Inc.	**Phone:**	(403) 819-7125
Date:	2021/07/09	**Email**:	Horst.klinkenborg@suncor.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	(i) The June 24th session was not valuable to Suncor. There are disconnects between stakeholders and the AESO that cannot be rectified by an information session. (ii) a. Suncor understands what the AESO considers areas of (mis-)alignment. Suncor has concerns with the stated points of alignment regarding energy storage. See 2. b. Suncor understands the proposed revised DOS recommendation. c. Suncor understands the proposed mitigation options.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	Suncor disagrees with the first two stated points of alignment for energy storage. The remaining points seem to be actual points of alignment. Given the fundamental differences in perspectives regarding the tariff design, the items of misalignment are likely only a subset of actual misalignments. Regarding energy storage: Energy storage is as of yet not clearly defined. From a tariff perspective, the important characteristic is that energy storage is both a producer and a consumer of electricity. Energy storage should be eligible to participate in all aspects of the markets according to their capabilities. This may include the listed aspects and potentially additional aspects.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Supportive/Not supportive The revised DOS modernization is a clear improvement over existing DOS. However, neither the current DOS nor the revised DOS is the opportunity/interruptible service that consumers need or want.
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	Suncor has previously stated it's concern about the AESO's DOS design in response to Session 5B. See also 8.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	Suncor understands the recommendation.
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Not supportive. The mitigation proposals do not address the fundamental issues with the tariff design. See 8.
7.	Do you have any further implementation considerations the AESO should consider?	As previously stated in response to Session 6A, the AESO should not implement a new design and should instead file a tariff based on the existing design. This would create time to receive policy clarity and allow stakeholders to fully evaluate the appropriateness of this novel design.

8.	Additional comments	Alberta requires a tariff design that properly reflects the impact of load diversity and (non-)coincidence. According to the AESO, load shapes are a core element when planning for load on the system and when creating transmission system planning studies (https://www.aeso.ca/assets/Uploads/Session-5B-DOS-Presentation2-v2.pdf, slide 38). However, they are not adequately reflected in the tariff. Once this is rectified, a proper opportunity/interruptible service can be developped that fills the gaps. It is not inherently clear that at that point any form of targeted mitigation would be required.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Luis Pando
Comments From:	TransAlta Corporation			**Phone:**	(403) 267-3627
Date:	2021/07/09			**Email**:	Luis_Pando@transalta.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	***TransAlta welcomes the additional clarity provided around DOS modernization but still has concerns about some elements of the proposal.*** We appreciate the additional details provided about the modernized DOS rate and also understand that the AESO has developed this recommendation in a short period of time without much input from stakeholders. We are concerned about certain aspects of the modernized DOS rate and believe that the rate should be redesigned to address these issues, which we explain further in our response to question 3 below. While we understand that it is the intent of the AESO to work out the details and explain the detailed mechanics of the modernized DOS rate and process in a future Information Document (ID), we are concerned that capturing this important detailed information in a non-authoritative document is not affording stakeholders a fair opportunity to fully understand the AESO proposal. ***TransAlta was expecting the AESO to address all concerns raised by stakeholders before closing the consultation.*** It would have been more efficient and valuable to address all outstanding questions and explain assumptions that have been contested by stakeholders during the consultation instead of deferring this until the filing of the tariff application. There are cost savings and efficiency benefit in providing these answers within the stakeholder process where the AESO can explain its answers in a two-way dialogue with market participants rather than in a regulatory proceeding in formal, written submissions. We encourage the AESO to consider these cost and efficiency benefits before it unilaterally determines that it would prefer to answer stakeholder questions in the regulatory proceeding rather than the consultation process. TransAlta supports the implementation of targeted mitigation mechanisms. We believe that it is important to allow load customers to adjust to this new design and avoid undue rate shock. We also understand that different customers may have different preferences on mitigation mechanism. For these reasons, we encourage the AESO to be accommodative and pursue meaningful mitigation measures rather than selecting the approach that is just easiest to implement.

2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	***The session only confirmed areas of alignment and misalignment that were already evident and did not provide any answers to comments.*** The AESO confirmed what parties have already expressed throughout the consultation by identifying areas of alignment and misalignment. While we appreciate that this effort assists in issue identification for the future Alberta Utilities Commission (AUC) ISO Tariff regulatory proceeding, it does little to address when misalignments are due to lack of information. The AESO has not answered many important questions about its preferred rate design nor has it justified or presented that factual analysis that underpins the assumptions used to develop its rate design. The AESO has only stated that it intends to answer some of the concerns raised by stakeholders in its tariff application. As stated above, we disagree that the regulatory process is an efficient forum to first present this information to stakeholders and recommend that the AESO consider a stakeholder session when it has more fully developed its proposal and prior to making its regulatory filing in October. We expect the AESO to test the potential impacts of the preferred-rate design and demonstrate this unrealistic scenario of limited self-supply and exports. For this purpose, the AESO should review its Delivered Cost of Electricity study using its proposed tariff and present the results as part of the consultation. TransAlta considers that the AESO has not fully explained the following points that are the basis of its proposal: • How the preferred-rate design achieves the principle of efficient price signals, incentives load growth and avoids inefficient self-supply decisions? • The rationale behind classifying costs between demand and energy before the functionalization step. • How does the allocation of more costs to energy complies with the principle of cost causation and reflect the time of use of transmission? • How the concepts of “minimum” versus “actual” system and the use of a regional delineation and AESO’s planning areas explains drivers for transmission costs and the proposed allocation between demand and

		energy? Are these static concepts or do they change as generation and load change? • Why did NERA's report did not consider co-generation and other forms of renewable generation in its estimation of self-supply under the preferred rate design? • How does the tariff deals with the issue of abundance of existing transmission? • The rationale behind using variable charges to recover fixed transmission costs. • What is the justification for using the proposed 5-year coincident peak average and not 1-2-3-4-year averages and why should months outside summer and winter should be considered?

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	***TransAlta is somewhat supportive of the changes the AESO is proposing for a modernized DOS but still requires more information on the details to fully support the recommendation.*** As stated in our comments to Session 5B, we do not agree that the AESO should have a role in reviewing a business case under a modernized design and welcome the removal of this unnecessary requirement as it is administratively burdensome. TransAlta is somewhat supportive of the replacement of the business case with a representation but has concerns that the requirements of the latter will not entail a big difference from the current economic test nor achieve a significant red tape reduction. ***The AESO's proposal to monitor the use of DOS should be explained more clearly as this increases the risk for DOS being revoked.*** We also need more information about the AESO's monitoring of DOS misuse and how the criteria will trigger an automatic presumption of DOS misuse. Even though the AESO explained that the dispute resolution process in the ISO rules would apply, we still require information about the requirements and the reasons for a possible investigation or penalty. ***The use of historical data does not reflect the current market conditions or broader application of DOS going forward.*** We struggle with historical data being useful or reliable enough to determine a maximum load factor, particularly for energy storage. We do not have enough information to support the AESO's proposed maximum load factor or how it will be applied. As stated during the session, the assessment of the 20 per cent maximum load factor needs to consider market opportunities that may occur during the year and that will entail surpassing the maximum load factor limit, and allow market participants to explain their conduct.
4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	See our responses to 3 above.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	See our response to 3 above.

6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	***TransAlta is "somewhat supportive" with respect to its support to the targeted mitigation strategy.*** Many impacted parties have expressed concerns with the options presented by the AESO, particularly over the use of bill credits as they could be construed as a subsidy. It is also unclear whether any of these parties will choose any of the alternatives and sign a Memorandum of Agreement with the AESO as part of the application. Therefore, we recommend the AESO to continue to explore alternatives such as interruptible/opportunity rates.
7.	Do you have any further implementation considerations the AESO should consider?	***TransAlta would like clarity around the possibility for energy storage projects to qualify for modernized DOS in the future.*** TransAlta is concerned that the modernized DOS rate will, at earliest, be implement in January 2024. We believe that achieving certainty this late will negatively impact energy storage development. We ask the AESO to consider another approach such as splitting off energy storage rates so as to avoid having those rates being held up until the approval of full bulk and regional tariff redesign package.
8.	Additional comments	No additional comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Mark Thompson
Comments From:	TC Energy Corp. (TCE)	**Phone:**	403-589-7193
Date:	2021/07/09	**Email**:	markj_thompson@tcenergy.com

Instructions:

1. Please fill out the section above as indicated.
2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	TCE appreciates all opportunities for stakeholder consultation. The presentation of more details regarding the AESO's DOS modernization recommendation and the mitigation options were helpful. It would have been helpful for the AESO to present the analysis to substantiate its concerns regarding Rate DTS cannibalization. TCE appreciates that the AESO revised its Estimating Rate Calculations Tool to include Rate XOS.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	Overall, TCE supports the implementation of a demand opportunity service for the charging needs of energy storage facilities. While TCE supports certain elements of the AESO's proposed DOS modernization recommendation, we do not support other elements of the recommendation.

4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	Business Case/Customer Representation The replacement of the business case with the customer representation does not address TCE's primary concern that only those energy storage assets where Rate DTS would be uneconomic can qualify for this rate. As such, TCE's FEOC and discrimination concerns remain. DTS Contract Level TCE supports the AESO's proposal to allow the customer to choose the appropriate DTS level for its project. TCE however is concerned by the AESO's statement that this choice may impact a project's ancillary service qualification. This would be inconsistent with the treatement of other generators in Alberta that are not required to maintain a specific level of firm fuel supply. 20% Maximum Load Factor TCE continues to have concerns regarding this qualification requirement. DOS Monitoring TCE is further concerned that the AESO would consider revoking Rate DOS service from a customer that exceeded this threshold on the grounds that Rate DTS would have been economic. Such a conclusion cannot be made on the basis that a customer chose to operate after exceeding the 20% load factor threshold knowing that in doing so they would be charged at a Rate DTS level because it ignores sunk costs. These sunk costs could have made a project uneconomic under Rate DTS. Revoking Rate DOS service on this basis would be inefficient as it would hinder investment.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	TCE has no further questions at this time.

6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	TCE's concerns regarding the targeted mitigation remain.
7.	Do you have any further implementation considerations the AESO should consider?	TCE has no further comments at this time.
8.	Additional comments	TCE has no further comments at this time.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021	through	July 9, 2021	**Contact:**	Kipp Horton

2. Please respond to the questions below and provide your specific comments.
3. **Please submit one completed evaluation per organization.**
4. Email your completed comment matrix to tariffdesign@aeso.ca by **July 9, 2021**.

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	Turning Point Generation (TPG) found the session valuable in order to further understand the AESO's proposed DOS modernization recommendation. TPG is focused upon AESO's proposed tariff treatment of energy storage including related aspects of the preferred rate design. TPG is not focused on the mitigation options and therefore has not comments on the mitigation options.
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	Yes, TPG believes there is significant misalignment on the technology agnostic treatment of energy storage. The AESO has repeatedly stated that this principle is to stand and be maintained. We believe that applying the maximum load factor to energy storage under the modernized DOS proposal is not consistent with the technology agnostic principle.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	c) Undecided

4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	Yes, TPG has two major concerns with the revised DOS modernization as it relates to treatment of energy storage. 1. Max Load Factor – TPG believes that applying a maximum load factor to energy storage applications is inappropriate and does not achieve the guiding principle of technology agnostic treatment. Specifically, the 20% maximum load factor will significantly constrain the operations of long-duration storage assets. This constraint will likely limit the responsiveness and flexibility that are inherent in these storage technologies; at the expense of increased grid reliability. If a maximum load factor is required, higher capped limits may work to mitigate these undesirable outcomes. In this regard, the AESO should recognize that energy storage and price-sensitive loads require different treatment even if both are receiving the same modernized DOS rate. 2. Energy Storage Representation for DOS Qualification – TPG understands the AESO's concerns regarding the potential defection of customers from DTS to a modernized DOS rate. Customer representations make sense for price-sensitive loads that may be trying to avoid DTS to lower costs versus seeking opportunity in available transmission system capacity to sell services to the Alberta electricity grid like energy storage. Energy storage resources participate as a generator in the wholesale energy market unlike price-sensitive loads. The AESO should recognize that energy storage and price-sensitive loads require different treatment even if both are receiving the same modernized DOS rate. Energy storage participants should not be required to provide the proposed customer representation.

5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	None.
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	No comment.
7.	Do you have any further implementation considerations the AESO should consider?	None.
8.	Additional comments	None. TPG appreciates the AESO's continued consultation on these important topics.

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Stakeholder Comment Matrix – June 17, 2021

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B

Period of Comment:	June 17, 2021 through July 9, 2021	**Contact:**	Megan Gill

The AESO is seeking comments from Stakeholders on Session 6B. Please be as specific as possible with your responses. Thank you.

	Questions	Stakeholder Comments
1.	(i) Please comment on Session 6B hosted on June 24, 2021. Was the session valuable? Was there something the AESO could have done to make the session more helpful? (ii) Did you come out of Session 6B with additional clarity and a better understanding of the: a. Preferred rate design areas of alignment and misalignment? b. Revised DOS modernization recommendation? c. Mitigation options?	i) Yes the session was helpful. ii) a) Yes b) Yes c) Yes
2.	Do you think the areas of alignment and/or areas of misalignment need to include any additional elements? Please be specific.	In determining the preferred tariff design the AESO considered and modeled various alternatives. In the upcoming proceeding, the UCA would like the AESO to share the assessment criteria used when analyzing the other models and designs it considered inferior to the preferred design. This will allow the UCA to better understand how the AESO determined that the preferred rate design was the optimal choice, given the current legislative framework and cost causation principles.

	Questions	Stakeholder Comments
3.	How would you describe your level of support for the revised DOS modernization recommendation? a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	The UCA is not supportive of the revised DOS modernization recommendation. The UCA's concerns stem from the elimination of the requirement for market participants looking to procure energy at the DOS rate from needing to provide a business case clearly demonstrating the poor economics of their operations under the DTS rate. Omitting this vital screening process combined with the ability to reduce DTS contract levels opens the door to significant cannibalization of DTS revenues. While the UCA sympathizes with the need for the AESO to eliminate red tape in line with government's direction, it is important to acknowledge that this alternative proposal (i.e customer representation) will require greater AESO oversight over more market participants to ensure that DOS is being used as intended. Audits and clawbacks are all backwards looking mechanisms and not having real-time oversight of the market could potentially carry stability risk with regards to the efficiency of the wholesale market.

4.	Are there other elements of the revised DOS modernization recommendation design you support or have concerns with? Please be specific.	Combining DOS in a bid/offer process for bilateral transfers complicates administration and audit, making it difficult to ensure that the foundational economic opportunity thresholds are met in practice. It is expected that administrative costs would increase along with this increased complexity. If the AESO wishes to offer a rate that encourages the development of energy storage facilities, then a new energy storage specific rate would be more efficient and effective in avoiding cannibalization risks than the modified DOS. DOS was intended to function as an opportunity service accommodating only marginally economic business opportunities with secure protection against transactions that could otherwise have proceeded on rate DTS.. DOS was not intended to provide mitigation for increases in the cost of DTS by changing the balance of DOS/DTS consumption. Mitigation of DTS rate increases requires a direct mitigation mechanism that does not interfere with the effective application and management of DOS.
5.	Do you have additional clarifying questions that need to be answered to support your understanding of the revised DOS modernization recommendation?	It is not clear why the AESO decided to modify DOS given the revenue cannibalization risk. What function is the modified DOS intended to perform that could not be met by the original version of DOS?
6.	How would you describe your level of support for the targeted mitigation engagement outcomes? Please describe why or why not. a) Supportive b) Somewhat supportive c) Undecided d) Somewhat not supportive e) Not supportive	The UCA is supportive of the targeted mitigation engagement outcomes.

7.	Do you have any further implementation considerations the AESO should consider?	
8.	Additional comments	

Thank you for your input. Please email your comments to: tariffdesign@aeso.ca.

Attention:	Michael Law	President and CEO, AESO
	Miranda K. Erickson	Vice President, Markets, AESO
	Karl Johannson	Board Chair, AESO

Re: West Fraser concerns with AESO tariff redesign and mitigation process

Dear Mr. Law, Ms. Erickson and Mr. Johannson,

We at West Fraser Mills Ltd. (WF) are writing to you regarding the ongoing rate restructuring efforts conducted at Alberta Electric System Operator (AESO). WF has participated in the AESO tariff and mitigation sessions between April and June 2021 and has invested a cumulative time equivalent of 8 working days for mid-senior level attendees in meetings and engagement sessions alone.

The new rate redesign proposed by AESO will lead to a 10 - 40% increase in transmission costs at the three divisions identified by the AESO as Highly Impacted parties. The AESO tariff presents a disruptive, run to failure option for our operations in Slave Lake, Whitecourt, and Blue Ridge. WF operates 15 divisions across Alberta – located in 11 resource-based rural communities where operational stability has a direct impact on the overall health of the community and local economy.

As requested at the last session, the Memorandum of Agreement has been marked up by WF. The information marked as Notice to draft (NTD) has been added based on our understanding and the interpretation of proposed tariffs, and the impacts that rate restructuring and proposed mitigation will have on our divisions.

WF has been a corporate leader at taking action to improve energy efficiency at our energy intensive and trade exposed operations. We have also invested in multi-million-dollar projects to increase production of bioenergy. Our flexible loads have consistently responded to peak demand, and high-power pool price, have provided ancillary services and operate as high efficiency, high load factor customers. Despite these efforts, we have seen our transmission rates more than triple over the past 10 years.

West Fraser Mills Ltd.
1250 Brownmiller Rd,
Quesnel BC,
Canada V2J 6P5
www.westfraser.com

The high-power pool price resulting from economic withholding of power in the province puts WF operations at a further disadvantage – the viability and sustainability of our energy intensive operations is threatened by the delivered cost of power.

The impact on these operations is reduced production volumes, limitations to the variety of products we make, and impacts to profitability. Interrupting operations to control costs leads to more downtime and in turn, less revenue for the AESO.

We are naturally concerned with the proposed rate redesign and the lack of reasonable approaches to mitigation. The current mitigation in our opinion is a deferral for 3 years – following which operations are left with unfair and unsustainable choices. Current paths of action include either disconnecting from the grid, or a difficult analysis of the viability of operations in Alberta. Neither option provides an efficient outcome for WF or for the grid.

The current proposed tariff essentially has high load factor customers like Pulp and Paper mills subsidizing low load factor customers like oil and gas sites with cogeneration. Referring to the AESO materials and bill impact calculators – high load factor customers will see a bill impact of greater than 30% by year 5. In some cases, this may even be higher. We need more detailed conversations on the plans to mitigate impacts. The deferral of impacts should not be labeled as mitigation. The AESO team has not presented any rate classes or instruments that would allow high load factor industrial consumers to adapt in the future.

During our engagement sessions – we have repeatedly requested the economic and technical study materials that formed the basis of the tariff redesign. These requests were made to the AESO team but with no response. This new rate design is unconventional, unproven and the implications on industry, grid economics and the Alberta socio-economy must be closely studied. In the absence of these materials, we are unable to fully understand the fundamentals employed by AESO in redesigning the tariff.

The ongoing engagement session did not provide any sensitivity analysis towards the social, governance and business risks involved because of these rate redesigns. The proposed tariffs clearly create an unfavorable economic impact on large consumers that are price responsive, high efficiency, high load factor and diversified industrial customers in province of Alberta.

WF requests that the AESO executive strongly examine the possibility of giving due consideration to customers that provide a benefit to the grid of being energy efficient and price sensitive. This can be achieved through permanent mitigation rate classes included in the new tariff. We look forward to more detailed conversations in this matter.

We look forward to your response.

Yours truly,

Keith Carter

Stakeholder Comments on the AESO's Estimating Rate Calculations – July 16, 2021

Company	Stakeholder Comments
AltaLink Management	• No comments on Import/export revenue • Highlight the fact that the revenue requirement values for the 2020 and 2021 test years have changed in the updated Calculations Tool (line 9, columns C and D). The values no longer tie to the 2020 and 2021 Tariff Update applications. I believe the AESOs filed Tariff 2020 and 2021 Updates included an estimate for import/export revenue; it appears, on the surface, that these amounts are now double-counted.* **The AESO responded to this comment by publishing Estimating Rate Calculations Tool v0.3 on its website on July 15, 2021.*
CWSAA	See attached submission
Heartland Generation	Question: Relatively minor, but curious about how the "Estimated DOS/XOS Rate" in cells F38 and F42, respectively, are calculated. The $15 estimates don't seem to be a simple average of the test rates (inclusive or exclusive of 2019-2021 test years). It is likely that this value is a very rough approximation without a strict associated calculation. Any information on these values and how they are calculated would be appreciated. Concerns: Further to Heartland Generations comments on Session 6B, we are concerned about the significant and material impact of the drastic increase to rate XOS. This sudden increase to rate XOS during all hours of the year will have serious repercussions to the commercial viability of exports in the vast majority of hours. This is especially true of traditionally lower-priced hours when exports could take advantage of opportunities in neighbouring markets. During these periods of depressed Alberta pool prices, exporters can remain operational and provide reliability/ancillary services/etc. products to the Alberta grid while collecting the foreign price for the majority of production. It is my understanding that the doubling of rate XOS (as this estimate indicates) will evaporate these economic opportunities by eliminating an already slim price spread. This will subsequently force Alberta generators to possibly shutoff during periods when they could have remained operational/online (and thus no longer provide ancillary support to the Alberta grid). Further, the impact of these increased rate XOS fees are felt primarily during periods of lower grid utilization and/or system stress. Charging rate XOS as a flat energy charge is contrary to logic, and at a minimum the AESO should investigate and report on the correlation between rate XOS usage and transmission system costs/stress. A possible conclusion from this report could be a profiling of rate XOS to best reflect transmission capacity/costs through time; there is inherent logic behind shaping rate XOS as different $/MWh charges at different hours of the day. The designation of rate XOS as an opportunity service best illustrates the need to modernize all opportunity service products considering the preferred tariff design. As is, the estimated rate XOS will cause market harm to an already fragile intertie relationship as exports will be further disincentivized relative to the treatment of imports.

	Heartland Generation requests that the AESO conduct further consultation regarding rate XOS modernization. This could begin with an AESO impact assessment of increasing the associated charges by almost double in all hours for exporters. This research should include impacts to perceived fairness between imports/exports on the intertie and consequences of disincentivizing exports on the domestic Alberta markets for ancillary services and other similar products.
IPCAA	In its spreadsheet, the AESO has used information from the 2020 Long-Term Transmission Plan based on the AESO's Reference Case to calculate Rate DTS - Rates IPCAA would recommend that: • The AESO also provide Rate DTS - Rates based on the "High Cogeneration Sensitivity" scenario. With rising carbon prices and the financial and environmental incentives for industry to install co-generation, the "High Cogeneration Sensitivity" scenario could very well materialize. • The AESO also provide an equivalent analysis for the four distribution utilities. The AESO should include the unit rates ($/kW and $/kWh) for each utility so that consumers can carry out rate impact assessments. Without this information, it will be extremely difficult for consumers to provide evidence to the AUC on potential impacts caused by the proposed tariff design.
MATL	1. MATL understands that the new tariff redesign will increase the cost of exporting energy from Alberta (i.e., through higher XOM/XOS charges, or additional charges beyond XOM/XOS). MATL has the following questions: (a) How will the AESO determine the new XOM/XOS rate, and/or other charges? The AESO has provided a calculator on July 7, 2021 & July 15, 2021. Please provide an example calculation in an excel spreadsheet (with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. Please demonstrate all potential impacts to XOM/XOS within the calculator and explain how it may impact MATL and its customers. Please provide further explanation on the rationale of the 20% multiplier applied to the Bulk & Regional System Calculations, and the 32% multiplier applied to the Ancillary Services Revenue Requirement. (b) Will the cost increase be higher or lower when compared to services that are recalled after XOM/XOS such as DOS? Please provide an example calculation in an excel spreadsheet (with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff, including proposed mitigations. (c) The AESO has assumed in its rate calculator that the export volumes will be 130,000MWh in the future. Please explain the basis for this amount and how the AESO assessed the amount of export volumes that will result from higher XOM/XOS rates? Please demonstrate the reduced exports that will result from an increase in the XOM/XOS rates. Please provide an example calculation in an excel spreadsheet (with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. (d) Is the AESO expecting an overall reduction in offsets from export opportunity service revenue? If so, by how much? (e) Please list and fully explain all mitigations that will be put in place by the AESO for stakeholders impacted by the increase in XOM/XOS charges? Please also list and fully explain all mitigation that will not be put in place by the AESO and the reason for them not being considered.

Public

Company	Stakeholder Comments
	(f) Non-firm interruptible rate class was not accepted by the AESO for DOS mitigations as described in the Session 6B on June 24, 2021. Given that XOM/XOS is already a non-firm interruptible rate class, please explain if revisiting the method for calculating XOM/XOS charge would avoid adverse impacts to exports. Please explain the impact if the AESO tariff were to provide firm transmission service for XOM/XOS services. 2. Will the new tariff redesign increase the cost of importing energy into Alberta (i.e., through higher IOS charges, or additional charges beyond IOS)? If yes: (a) How will the AESO determine the new IOS rate, and/or other charges? Please provide an example calculation in an excel spreadsheet(with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. (b) How has the AESO assessed the reduced import volumes that will result from higher IOS rates? (c) With respect to the AESO's existing and future practices of operating international cross border interties, has the AESO considered compliance to the United States-Mexico-Canada Agreement (USMCA)? With these comments, MATL Canada & MATL LLP is also reiterating its request that the AESO consult with MATL and its customers on the proposed changes to XOM/XOS rates, as there will be a material impact beyond the 10% threshold set by the AESO. MATL is available to discuss the above questions and comments. Due to vacation schedules, anytime after August 10 would be the best time to schedule a consultation.
TCE	The updated rate estimate included for the first time the impact to Rate XOS resulting from the AESO's proposed Bulk & Regional rate design. The following comments are with respect to Rate XOS. As a Rate XOS customer, TC Energy is concerned that the proposed rate design will cause Rate XOS to increase by approximately 80%. This is substantial and can be expected to significantly impact future export opportunities. TC Energy is further concerned that Rate XOS will be inconsistent with prior Commission rulings and cost causation. As a result, we recommend that the AESO consult with parties specifically with respect to Rate XOS. TC Energy has the following questions with respect to Rate XOS: 1. What mitigation measures will the AESO propose for Rate XOS customers that will see an 80% rate impact? 2. What impact will this rate increase have on future exports?
TransAlta	TransAlta appreciates the AESO revised Estimated Rate Calculations Tool but has concerns with the lack of information on the rate for export opportunity services. The estimates provided by the AESO include a significant increase to rate XOS/XOM from the current ~ $8/MWh to ~$15/MWh. TransAlta recommends the AESO to hold further consultation to openly discuss with stakeholders its proposal for rate XOS/XOM including a discussion about any analysis that the AESO has performed on cost-causation including any alternatives that were considered as the methodology behind this proposed XOS/XOM rate. The AESO has not justified the proposed increase to rate XOS/XOM in terms of cost causation and efficient price signals and has not provided information about the impact of the preferred rate design on energy exports. It is unclear how the change to allocate more costs to the energy component is reasonably driven by exporting electricity from the province. The AESO is sending a price signal that represents a significant change to the economics of exporting. We are concerned that this rate change will have unintended consequences and would

Public

Company	Stakeholder Comments
	like to understand the AESO's analysis of how this change could impact export activity. The substantial increase in rate XOS/XOM could potentially reduce demand to export which in turn may reduce the contribution from XOS/XOM to transmission costs and create a shortfall that needs to be recouped from other customers. The AESO must demonstrate that its proposed rate XOS/XOM is not discriminatory and is not treating customers unfairly. We recommend that the AESO explain stakeholders how it determined the appropriateness of applying such a significant increase in the energy charge for the new XOM/XOS rate and provide any analysis that was undertaken of the expected impacts of the proposed change to export activity. We wish to understand the basis for the AESO's estimate that export volumes will be 130,000 MWh/year and will remain at that level for future years and request the analysis that was conducted to determine this estimate. We are concerned with the distorting effect that such a high export rate could have on the wholesale market, which will reduce the attractiveness of and opportunity for export sales, and could result in higher costs to Albertans - Alberta generators would be even more reliant on the Alberta market to earn all of their revenues. Furthermore, we recommend that the AESO consider phasing in this rate over time to provide the market time to adjust to this significant increase in rate just as it is doing with other industrial customers that are being impacted with costs that are greater than 10% of the current rate. Finally, it is unclear whether the new tariff redesign will increase the cost of importing energy into Alberta through higher IOS charges. The AESO should provide this information before filing its tariff, including details about how will the AESO determine the new IOS rate, and/or other charges and assessment of impact on import volumes that will result from higher IOS rates.

Public

CWSAA – Comments & Questions Regarding AESO Updated Rate Estimates

SUMMARY

" Comments and questions regarding the updated rate estimates can be submitted by email to tariffdesign@aeso.ca by July 16, 2021. "

The vast majority of Alberta's electricity consumers receive a flow-through of the AESO's transmission tariff through their local distribution company. The AESO's preferred tariff structure would have potentially major impacts, which can only be assessed by using a distribution flow-through version of that tariff. The information provided by Fortis, EPCOR and ENMAX is insufficient to carry out the required impact assessments; the actual tariff rate sheets are necessary.

The companies also have an inconsistent jumble of demand ratchet policies, which are being applied to AESO bulk tariff charges which have no demand ratchet. This monstrous regulatory inefficiency must be addressed, lest customers literally across the street from one another receive radically different impacts from the single, standard provincial transmission tariff.

With the AESO's coordination, the distribution companies will surely cooperate in providing this information; if cooperation is not forthcoming, the AUC's guidance may be necessary.

6.2 FORECAST DTS & DT RATE CLASS BILLING DETERMINANTS 7
6.3 TRANSMISSION COST ALLOCATION METHOD (TO RATE CLASSES) 8
6.4 THE RATE DESIGN METHOD 9

1 CONTEXT OF COMMENTS

> "The Commission expects parties to provide evidence of the potential impacts of any proposed bulk and regional tariff rate design as part of the Commission's consideration of the application." [1]

The AESO's bill impact tool will be very useful for parties who are served at the transmission level. Unfortunately this tool is of no assistance in assessing potential impacts on the majority of Alberta's electric system customers, who are served through distribution utilities' unique versions of the standard, province-wide AESO tariff.

The industry's fragmentation into separate transmission and distribution entities has led to significant seams issues between the two areas, some of which are currently under regulatory review. The AESO tariff flow-through is another such seams issue which must be addressed in order for customer representatives to estimate and analyze these potential rate impacts.

2 DISTRIBUTION UTILITIES ARE INDIFFERENT TO TRANSMISSION FLOW-THROUGH

Ever since PBR Decision 2012-237, para. 666:

> …the AESO related cost items will be dollar-for-dollar flow-through items in the [electric distribution] companies' PBR plans "

The electric distribution companies can neither gain nor lose in this flow-through process, and should therefore be supportive of any calculations and analysis required for its implementation.

3 ASSESSING THE DIFFICULTY OF ESTIMATING DISTRIBUTION FLOW-THROUGH RATES

One might hypothesize that all the data required to estimate distribution flow-through rates under the AESO's preferred tariff design is already available, and it should be a simple matter for customer representatives to calculate these rates in their impact analysis.

To test that hypothesis, the appended analysis reviews the publicly available data and calculation tools.

[1] 25175_X0142_2021-06-01 AUC letter - Ruling on the Alberta Electric System Operator extension request _000175, para.9

[1] The existing and preferred AESO DTS rates are known, and

[2] the forecast DTS & DT rate class billing determinants are said to be available in the annual PBR rate adjustment proceedings.

[3] In those PBR applications, both FortisAlberta and EPCOR Distribution & Transmission provide forecast transmission revenues by rate class, which can be compared to the revenue forecasts provided in the AESO impact analysis. For unknown reason(s), the numbers do not match, and the variances seem quite random.

[4] To assess the overall rates process, the current transmission rate can be compared to the rates implied in the companies' AESO tariff impact analysis.

The residential rate class is universally billed on a ¢/kWh basis for transmission charges, which simplifies the analysis. The implied rate as per the impact analysis can be calculated by taking the stated revenues and dividing them by the PBR forecast. (Except for ATCO, whose impact analysis has not yet been provided).

The result is somewhat disconcerting: the numbers don't match, by a significant amount.

	Total 2019 DTS (On Currently Approved AESO Structure)	2021 Energy (kWh)	Implied Unit Rate	Current Tariff Rate	$ Difference	% Difference
	[A]=Data	[B]=Data	[C]=[A]/[B]	[D]=Data	[E]=[D]-[C]	[F]=[E]/[D]
ATCO Electric Inc.	< Not Provided >	1,400,729,231				
ENMAX Power Corp.	$ 112,475,630	3,044,093,073	$ 0.03695	0.038763	$ 0.0018	4.7%
EPCOR Distribution & Transmission Inc.	$ 77,126,402	2,316,573,488	$ 0.03329	0.03610	$ 0.0028	7.8%
FortisAlberta Inc.	$ 139,040,000	3,339,937,368	$ 0.04163	0.04394	$ 0.0023	5.3%

This analysis in no way suggests that the companies have made any errors in their calculations. There are no doubt several calculation errors in the analysis above, which a technical expert who works with these calculations on an everyday basis would be able to identify.

Its purpose is only to demonstrate that it is extremely difficult to confidently calculate the transmission unit rates that the companies must have used in their internal calculations. The only way in which the typical bill impacts could have been accurately calculated is if the companies had worked out the actual tariff unit rate components. Since this information must already exist, the distribution companies should kindly provide it (with the possible exception of ATCO Electric, which does not appear to have provided any tariff impact analysis).

Without knowing the electric distribution companies' flow-through rates, it is extremely difficult for parties to estimate the customer impacts of the AESO's preferred tariff design option.

4 INCONSISTENCY OF COMPANIES' TRANSMISSION TARIFF FLOW-THROUGH

Both the current and the preferred AESO tariff structures recover bulk / demand related charges through a monthly unratcheted billing determinant. However the distribution utilities have a collectively chaotic jumble of ratchet policies, summarized in the following table. **ATCO Electric** consistently uses an 85% X 12 month ratchet, **ENMAX Power** consistently uses a 90% X 12 month ratchet, while **EPCOR** covers all alternatives.

In **Fortis'** 2012-2014 Phase II Distribution Tariff proceeding (ID 2363, Decision 2014-018), the Commission concluded "that mirroring of the AESO's charges in Fortis' rates is consistent with cost causation" [¶175] and as a result Fortis is the only company that mirrors the AESO's current and proposed rate structures for its general service rate classes.

	TREATMENT OF UNRATCHETED TRANSMISSION CHARGE (Bulk / Demand)				
		Monthly	85% X 12 Mon	90% X 12 Mon.	90% X 24 Mon.
FAI	RATE 22 - FARM SERVICE – DEMAND METERED		X		
FAI	RATE 41 - SMALL GENERAL SERVICE	X			
FAI	RATE 45 - OIL & GAS SERVICE		X		
FAI	RATE 61 - GENERAL SERVICE	X			
FAI	RATE 63 - LARGE GENERAL SERVICE	X			
EDTI	Commercial/Industrial 50 kVA to <150 kVA			X	
EDTI	Commercial/Industrial 150 kVA to <5,000 kVA		X		
EDTI	Primary Commercial/Industrial 150 kVA to <5,000 kVA		X		
EDTI	Commercial/Industrial Greater than 5,000 kVA				X
EDTI	Commercial/Industrial Greater than 5,000 kVA Totalized				X
EPC	Rate D300 - Medium Commercial			X	
EPC	Rate D310 - Large Commercial - Secondary			X	
EPC	Rate D410 - Large Commercial - Primary			X	
AE	Rate D21 - Standard Small General Service		X		
AE	Rate D24 - Standard Small General Service - Isolated Industrial Areas		X		
AE	Rate D31 - Large General Service / Industrial - Distribution Connected		X		
AE	Rate T31 - Large General Service / Industrial - Transmission Connected		X		
AE	Rate D32 - Generator Interconnection & Standby Power		X		
AE	Rate D34 -Large General Service / Industrial - Isolated Industrial Areas		X		
AE	Rate D41 - Small Oilfield and Pumping Power		X		
AE	Rate D44 - Small Oilfield and Pumping Power - Isolated Industrial Areas		X		

The AESO's preferred tariff structure greatly increases the importance of knowing the individual tariff rate components. The unratcheted 'bulk' system charge is dropping by 41% while ratcheted 'regional' system charge is dropping by 23%; this is offset by a 367% increase in the energy charge.

With such massive dislocations occurring, accurate end user rates are essential. Most customers' consumption shows some degree of seasonality, and the preferred tariff structure would greatly alter the costs flowing from seasonal usage.

The Commission has directed Fortis to flow the 'bulk' system charge through to end use customers using "CWSAA's proposed new billing determinant of un-ratcheted 'kW of billing period capacity' for rates 61 and 63." [2014-018 ¶175] The 'kW of billing period capacity' is simply 'the highest metered kW demand in the billing period', a value which is readily available for all demand-metered customers.

The Electric Utilities Act contains a clear policy statement regarding the AESO tariff, that

> (3) The rates set out in the tariff
>
> (a) shall not be different for owners of electric distribution systems, customers who are industrial systems or a person who has made an arrangement under section 101(2) as a result of the location of those systems or persons on the transmission system, and
>
> (b) are not unjust or unreasonable simply because they comply with clause (a).

It is of course reasonable that the AESO tariff flow-through by electric distribution companies reflect local system realities; but these inter-company differences appear to be historical accidents, left unaddressed ever since the change in AESO tariff structure in 2006. This is surely an opportunity to improve regulatory efficiency by adopting a consistent tariff flow-through approach.

Without prejudice as to the ultimate outcome, customers need to assess the potential impacts of a more accurate, harmonized tariff flow-through. This should be provided as an alternative scenario, in addition to rates under the current companies' tariff structures.

5 RELIEF REQUESTED – AESO COORDINATION OF ANALYSIS

What is required is a set of System Access Service rate schedules from each of the utilities, with all the required unit rates populated using the AESO's preferred tariff design, and a narrative defining the specific data sources and calculations used. These unit rates must already exist, given that the companies have calculated typical bill impacts.

The AESO is responsible for its tariff application, and for enabling parties to assess the impacts of its proposals. The AESO is therefore responsible for coordinating with the electric distribution companies to provide the flow-through rates that are required to assess "the potential impacts of any proposed bulk and regional tariff rate design."
In the unlikely event that the companies were not cooperative, the AESO could seek guidance from the AUC. In the unlikely event that the AESO is unwilling to provide this coordination, the parties could approach the AUC with a request that the necessary unit rates be provided.

6 TECHNICAL REVIEW OF DATA & CALCULATION TOOLS AVAILABLE

The required data and calculation tools are described in the identically worded notes to the three utilities' rate impact calculations (see endnote): [i]

1. "Analysis completed by <Company> based on its Transmission Cost Allocation method and Rate Design to DT rate classes as currently approved by the Commission."

2. "Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in <Company's> 2021 Annual PBR rate filing) as summed across all <Company's> D-connected PODs."

To summarize, the two inputs are prices and volumes:
[1] the AESO 2019 DTS rates, and
[2] the forecast DTS & DT rate class billing determinants [per PBR filings]. [2]

The two calculation processes are allocation and rate design:
[3] the Transmission Cost Allocation method (to rate classes), and
[4] the Rate Design method.

6.1 AESO 2019 DTS Rates

The AESO 2019 DTS rates are publicly available, per the AESO (see for example the Bill Calculation Tool, tab "Adjust Load Profile") :

Connection Charge					
Bulk System Charge					
3(a)	Coincident metered demand	$10,087.00	/MW/month	$5,980.00	/MW/month
Regional System Charge					
3(b)	Billing capacity	$2,668.00	/MW/month	$2,055.00	/MW/month
Energy Charge					
3(c)	Metered energy	$2.18	/MWh	$10.19	/MWh

[2] "Forecast billing determinants are generally used to allocate K, K-bar, Y and Z factors to rate classes and to calculate the resulting rate adjustments." [25843_X[]_25843-D01-2020 Fortis 2021 Annual PBR Rate Adjustment_000103 ¶ 39, see also 25864_X[]_25864-D01-2020 AE 2021 Annual PBR Rate Adjustment_000055 ¶ 35, and 25865_X[]_25865-D01-2020 EPC 2021 Annual PBR Rate Adjustment_000060 ¶ 32]

6.2 Forecast DTS & DT rate class billing determinants

[2] Forecast DTS & DT rate class billing determinants are available in the annual PBR filings:

Proceeding	Description
25866	EDTI 2021 Annual PBR Rate Adjustment Filing
25865	ENMAX Power Corporation 2021 PBR Rate Adjustment Application
25864	ATCO Electric 2021 Performance Based Regulation ("PBR") Rates Application
25843	FortisAlberta 2021 Annual Rate Adjustment Filing

However the availability of information differs greatly between the four companies.

- FortisAlberta provided a 'bottom up' transmission cost, revenue and annual transmission rate update (TACDA) together with the load forecast as part of its annual PBR filing ID 25843. [3]
    - Note that Fortis uses (unratcheted) 'Monthly non-coincident peak demand' to allocate bulk system transmission charges. [ii]
    - The other three companies use the same ratcheted billing demand approach for both bulk and regional charge recovery (discussed above).

- EPCOR Distribution & Transmission also provided a 'bottom up' transmission update together with the load forecast. [4]

- ATCO Electric provided a 'top down' 2021 transmission rate update in its 2021 PBR application, applying "a scaling approach to its 2020 transmission rates approved in Decision 25645-D01-2020."[5]

- ENMAX Power did not address transmission rate updating in its 2021 PBR application. [6]

[3] "64. In its application, Fortis requested approval of its 2021 SAS rates, to be effective January 1, 2021.56 Fortis indicated that its proposed 2021 SAS rates reflect the rates applied for by the AESO in Proceeding 26054…."
"65. Fortis indicated that to determine the rate class-specific changes in the transmission access component for distribution-connected rate classes, it used the methodologies from its last Phase II distribution tariff application, approved in Decision 2014-01860 and the associated compliance filing, Decision 2014-224."
[4] 25866_X[]_25866-D01-2020 EDTI 2021 Annual Performance-Based Regulation Rate Adjustment, ¶ 59
[5] 25864_X[]_25864-D01-2020 AE 2021 Annual PBR Rate Adjustment, ¶ 49
[6] 25865_X[]_25865-D01-2020 EPC 2021 Annual PBR Rate Adjustment, ¶ 32

6.3 Transmission Cost Allocation method (to rate classes)

The Fortis and EPCOR forecasts contain transmission rate class revenue forecasts which can be compared with the forecasts provided in the AESO impact analysis, as follows. (Note that the % differences are quite irregularly distributed.)

FORTIS ALBERTA INC.

25843_X0005.01_Schedule 3.2 2021 Updated Transmission Cost Allocation - Tab 3.2B DTS Connection

Summary of Transmission Costs by Rate Class ($ 000)

Line	Rate Class Description	Total AESO DTS Charges [A]=Data	Total 2019 DTS (On Currently Approved AESO Structure) [B]=Data	$ Difference [C]=[B]-[A]	% Difference [D]=[C]/[B]
1	Residential	$ 137,071	$ 139,040	$ 1,969	1.4%
2	FortisAlberta Farm	$ 28,011	$ 28,269	$ 258	0.9%
3	REA Farm	$ 23,287	$ 23,575	$ 288	1.2%
4	FortisAlberta Irrigation	$ 17,162	$ 16,637	$ (525)	-3.2%
5	Exterior Lighting	$ 1,964	$ 1,956	$ (8)	-0.4%
6	Small General Service	$ 53,749	$ 56,522	$ 2,773	4.9%
7	Oil and Gas	$ 24,216	$ 25,391	$ 1,175	4.6%
8	General Service	$ 208,561	$ 230,570	$ 22,009	9.5%
9	Large General Service	$ 110,269	$ 113,876	$ 3,607	3.2%
10	Distribution-Connected	$ 604,291	$ 635,836	$ 31,545	5.0%

EPCOR DISTRIBUTION & TRANSMISSION INC.

25866_X0007.01_Appendix E - 2021 SAS COSS_Blackline, Tab SAS-1a 2021

Table 2 - SAS Revenue Requirement Allocated to SAS Rate Classes

	Revenue requirement w/o DC and CST	Total AESO DTS Charges [A]=Data	Total 2019 DTS (On Currently Approved AESO Structure) [B]=Data	$ Difference [C]=[B]-[A]	% Difference [D]=[C]/[B]
1	Residential	$ 79,956,127	$ 77,126,402	(2,829,725)	-3.7%
2	< 50kVA	$ 25,662,480	$ 24,725,583	(936,897)	-3.8%
3	50 to 149 kVA	$ 34,863,775	$ 33,609,945	(1,253,830)	-3.7%
4	150 to 4,999 kVA	$ 65,514,148	$ 63,044,365	(2,469,783)	-3.9%
5	Direct Connects *	$ 10,560,340	$ 10,282,842	(277,498)	-2.7%
6	150 to 4,999 - Primary	$ 22,882,916	$ 21,321,132	(1,561,784)	-7.3%
7	>5,000 kVA - Primary (CS)	$ 23,075,648	$ 22,059,494	(1,016,154)	-4.6%
8	CST *	$ 7,511,504	$ 7,347,761	(163,743)	-2.2%
9	Street Lights	$ 805,593	$ 1,059,008	253,415	23.9%
10	Traffic Lights	$ 119,524	$ 118,991	(533)	-0.4%
11	Lane Lights	$ 50,458	$ 49,369	(1,089)	-2.2%
12	Security Lights	$ 69,940	$ 68,725	(1,215)	-1.8%
13	**Total**	271,072,454	260,813,617	(10,258,837)	-3.9%

There are surely good reasons for these differences, but considerable research appears necessary in order to elucidate their causes; the data come from different sources at different times, involving several different years and critical adjustments like loss factors between the point of delivery and the customer meter.

Since there are no specific sources listed for the companies' calculations, the search for understanding may be prolonged. For ENMAX and ATCO, the challenge is somewhat greater given the lesser amount of available information.

6.4 The Rate Design method

For rate classes billed on energy only (residential, small commercial…), calculating unit rates under the existing and proposed rates should in principle be simple. We need only divide the calculated dollar amounts by the kWh energy forecast to obtain the two rates.

The energy data source is "the forecast DTS and DT rate class billing determinants (as approved in <Company's> 2021 Annual PBR rate filing) as summed across all <Company's> D-connected PODs."

Proceeding	Description	Source File	Reference	2021 kWh

Taking the revenue data provided by the companies in their impact analyses, "Total 2019 DTS (On Currently Approved AESO Structure)", and calculating a ¢/kWh unit rate that can be compared to current tariffs, we have: [7]

	Total 2019 DTS (On Currently Approved AESO Structure)	2021 Energy (kWh)	Implied Unit Rate	Current Tariff Rate	$ Difference	% Difference
	[A]=Data	[B]=Data	[C]=[A]/[B]	[D]=Data	[E]=[D]-[C]	[F]=[E]/[D]
ATCO Electric Inc.	< Not Provided >	1,400,729,231				
ENMAX Power Corp.	$ 112,475,630	3,044,093,073	$ 0.03695	0.038763	$ 0.0018	4.7%
EPCOR Distribution & Transmission Inc.	$ 77,126,402	2,316,573,488	$ 0.03329	0.03610	$ 0.0028	7.8%
FortisAlberta Inc.	$ 139,040,000	3,339,937,368	$ 0.04163	0.04394	$ 0.0023	5.3%

The AESO's proposal represents major tariff structure change which cannot be assessed by simple rate class % impact calculations. Particularly for seasonal customers (which the CWSAA's ski hill members all are) it is essential to have the actual transmission tariff flow-through rate structures for impact assessment.

All that is needed here is for the four distribution utilities to make public the calculations which three of them have already completed but not disclosed. The three co-operating distribution utilities (EDTI, EPC and FAI) have all provided the same format of information, which speaks to a degree of helpful coordination for which AESO no doubt deserves the credit.

In particular, the estimated impacts on low / typical / high usage customers could only be calculated if unit rates ($ / kW, $ / kWh) had been calculated. Please provide those unit rates, so that customers can carry out rate impact assessments.

There are at least four possible resolutions to this situation:

[A] The AESO could coordinate the four distribution utilities' voluntary provision of this information, and if full cooperation is not forthcoming then

[B] The AESO could itself carry out these calculations, which would ensure transparency and broad access to consistent estimates. Presumably the AESO would itself have understood, reviewed and confirmed the distribution utilities' calculations, and would have the expertise to carry out these calculations as needed.

[C] Industry participants could individually carry out these calculations, likely with different results depending on assumptions made, which could well waste considerable time in the regulatory process as the varying customer impact calculations would then need to be compared through litigation.

[7] Sources: https://www.enmax.com/ForYourBusinessSite/Documents/2021-07-01-DT-Tariff-Rate-Schedule.pdf
https://www.epcor.com/products-services/power/rates-tariffs-fees/Documents2/sas_april2021.pdf
https://www.fortisalberta.com/docs/default-source/default-document-library/2021-july-rates-options-and-riders.pdf?sfvrsn=7eaf9e1b_4

[D] Any party could presumably make a motion in Proceeding 25175 requesting that the AESO or the distribution utilities be directed to provide the necessary customer level rates, so that consistent impact assessments can be carried out by the industry.

ENDNOTES

[i] **Electric distribution companies' statements re: transmission cost allocation & rates:**

FortisAlberta Inc.

1. Analysis completed by FortisAlberta based on its Transmission Cost Allocation method and Rate Design to DT rate classes as currently approved by the Commission.

2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in FortisAlberta's 2021 Annual PBR rate filing) as summed across all FortisAlberta D-connected PODs .

ENMAX Power Corp.

1. Analysis completed by EPC based on its Transmission Cost Allocation method and rate design to DT rate classes as currently approved by the Commission.

2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in EPC's 2021 Annual PBR rate filing) as summed across all EPC D-connected PODs.

EPCOR Distribution & Transmission Inc.

1. Analysis completed by EPCOR based on its approved System Access Service Cost of Service and Rate Design methodology.

2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in EPCOR's 2021 Annual PBR rate filing) as summed across all EPCOR Distribution-connected PODs

Bulk and Regional Tariff Design Session 6B Summary

Bulk and Regional Tariff Design Stakeholder Engagement Session 6B hosted on June 24, 2021

I. Purpose and objectives of the session

The purpose of the session is to engage stakeholders in a discussion of the AESO's targeted mitigation discussion outcomes, Session 5B (DOS) and Session 6A stakeholder feedback, and areas of alignment. The session objectives include:

- Provide an overview and seek stakeholder input on the outcomes of the targeted mitigation engagement
- Share our learnings and seek stakeholder input on Session 5B (DOS) and Session 6A stakeholder feedback and areas of alignment
- Present and discuss implementation considerations
- Seek to understand outstanding stakeholder concerns

II.Session agenda

Time	Agenda Item	Presenter
8:00 – 8:15	Welcome, introduction, purpose, and session objectives	AESO / Stack'd
8:15 – 9:00	Targeted mitigation engagement • Mitigation process and outcomes • Mitigation options • Mitigation next steps • Q&A	AESO
9:00 – 10:00	DOS modernization recommendation feedback and revisions (Session 5B) • Summary of learnings and feedback themes • Revisions to the DOS modernization recommendation resulting from feedback • Q&A	AESO
10:00 – 10:30	Break	
10:30 – 11:10	DOS modernization recommendation feedback and revisions (Session 5B) cont. • Summary of learnings and feedback themes • Revisions to the DOS modernization recommendation resulting from feedback • Q&A	AESO
11:10 – 11:30	What we heard – Session 6A • Summary of learnings • Q&A	AESO

IV. Overall outcomes from the day

The main objective of the session was for the AESO to engage stakeholders in a final discussion regarding AESO's preferred rate design and address outstanding stakeholder concerns prior to submission of the application to the Alberta Utilities Commission (AUC or Commission). Participants engaged in discussion and overall, the majority of stakeholders felt that this was a valuable session that allowed them to share their feedback.

V. Session highlights

Captured below are the highlights of the questions and discussion on a topic-by-topic basis. For a detailed review of the session, please refer to the session recording, posted at www.aeso.ca.

Topic 1: Targeted Mitigation Engagement

i. Stakeholder commentary

- Clarifying comments:
  - *IPCAA:* Why would a company sign this Memorandum of Agreement (MOA)? The AUC is not likely to allow greater than 10 per cent rate shock and these options are not helpful to the impacted companies.
  - *IPCAA:* This is a run-to-failure option for some of these customers. How does this help our overall goal of increasing load in Alberta in the long term? Are we going to lose these loads and if we are, what contribution are we losing to the grid? Why are we going after these customers so hard, I would rather keep them on the system and have them pay what they pay.
  - *Best Consulting Solutions:* You use Bill Credit instead of Invoice Credits, is there a reason? or difference?
  - *UCA:* Why not just the bill credit on energy? Simple, accurate and avoids torturing DOS structure and intent.
  - *ERCO:* what is the downside risk to the most impacted customers of not signing the MOA?

ii. AESO clarification

- Response to clarifying comments:
  - The reason why the AESO started this mitigation process is because we think that, if the significantly impacted parties are in agreement that the options are valuable, that will create greater weight to the options that go forward and potentially make it easier for the Commission to accept them.
    - These customers have shown that they are elastic to electricity costs and prices and have responded historically. This mitigation will allow them the period of transition to respond as they historically have done. The AESO views mitigation as a transition mechanism to lessen rate shock.

Public

- Regarding the use of terminology, there is no difference between Bill Credits and Invoice Credits.
- Regarding bill credits, some parties have identified that bill credits aren't a feasible option for them. The mitigation option of DOS gives companies a transitionary time to change their operations.
- Regarding the MOA, the options that go forward with our application hold more weight if customers sign the MOA. If parties don't sign on the MOA, the AESO will still include options for mitigation.

Topic 2: DOS modernization recommendation feedback and revisions (Session 5B)

i. Stakeholder commentary

- Clarifying questions:
  - *UCA:* How often would the audit for companies occur?
  - *CanREA:* What is the smallest DTS (Demand Transmission Service) contract that the AESO can handle? Less than 1 MW?
  - *TC Energy:* The AESO has said there is no business case underlying the representation. This contradicts the fact that there must be a business case that suggests that in order to receive DOS, the project is not feasible under rate DTS. If the party has already made the representation that DTS is infeasible, I don't actually know that you're going to get cannibalization, but it does limit revenue. For certain opportunities, it looks like we'd be exceeding 20 per cent, but not by a lot. Has the AESO done any analysis at, for example, 25 per cent?
  - *CCA:* We recognize there could be potential a DOS energy revenue increase. However, could the introduction of DOS trigger reductions in existing DTS contract levels and what would be the net revenue impact of these two effects?
  - *CanREA:* If a customer is already operating under DTS, how do they justify that they will only operate under DOS?
  - *Best Consulting Solutions:* If the customers are not required to take all the DOS energy, how does bidding assist the AESO?
  - *CanREA:* Can the AESO explain or soon provide examples of bidding related to DOS in combination with: 1) matched-asset method, where bids need to be less than lowest offer and 2) Variable Energy Resource (VER) block method, for hybrid resources where $0 offers are used for wind/solar energy?
  - *TransAlta:* On Slide 52 (DOS monitoring), how is the criteria established? What would constitute a violation of the criteria and what would be the opportunities for the customer to rebut that presumption? Can the AESO provide more context on the criteria?
  - *Capital Power:* The AESO is responsible for the final determination, but there are instances where a higher energy charge is worth it to chase a market opportunity that is not day in day out. Would the AESO view that as a mitigating circumstance through their regular monitoring or would the AESO view that as a violation?

Public

- *Best Consulting Solutions:* Not sure about the idea of bidding on DOS. Seeing that it becomes a risk and more work for customers to do that. Worried that we're creating more of a complex system and not going to see the benefit.

ii. AESO clarification

- Response to clarifying questions:
  - Monitoring will occur month to month at the end of each settlement period as well as an annual assessment every 12 months, from the time a customer started DOS as to whether they've exceeded that maximum load factor limit. And then AESO would use that as the determination if the AESO needs to look further into that customers particular use of DOS.
  - Regarding small DTS contracts, we have had a less than 1 MW DTS contracts.
  - Regarding the business case for DOS, the business case itself is not evaluated.
  - Regarding operating under DTS or DOS, if it is economic to use DTS for your load, the AESO would maintain you would continue to use DTS and not switch to DOS.
  - Regarding the bidding component of DOS, the AESO has the visibility of how much block volume of DTS is being taken. We also know the DTS contract capacity, and you can subtract that from the SCADA measurement to determine in real-time the amount of DOS energy consumed. That means we can simply go to the merit order and dispatch the blocks, which gives a signal to participants to not take DOS energy until the dispatch is done. It is integrated into the merit order and can see it in real time to control the recall.
    - Think of the bidding DOS as similar to that of wind and solar offers.
  - There are more advanced bidding approaches and the AESO will build and provide examples of bidding related to DOS in combination with the linked-asset method and the VER block method.
  - Regarding the criteria, the assessments themselves would be done monthly and we would look at those and compare it to what was stated within the application. A key violation of the criteria would be failing to respond to dispatch or directive. Over the year, if a DOS customer is exceeding the maximum capacity or load factor, they are signaling to the AESO that it is not operating within the terms of DOS. The AESO would allow the customer to provide additional information to explain the exceedances as part of the audit process.
  - Regarding instances where a higher energy charge is used to chase a market opportunity, the AESO would look to your explanation as to why the exceedance occurred. It would need to be a case-by-case assessment.

iii. Stakeholder commentary

- There was discussion regarding the Representation:
  - *CanREA:* Would the Representation [application] be approved when the SASR is accepted, that is in the move to queue Stage 2, so that participants have qualification certainty?
  - *UCA:* Who on behalf of the customer signs this Representation? Also wondering what about the structure of auditing or monitoring – would the AESO do this? Would there be a target to monitor/audit in a particular period?

Public

- *TransAlta:* If you're relying on the Representation, are customers allowed to change their Representation? With respect to the monitoring, could you provide more details about the additional remedies that would be added to the current terms and conditions?
- *DePal Consulting:* Regarding the Representation, can the AESO provide an example document clarifying the items that need to be stated in the representation? Is the Representation a one-time document based upon various reasonable assumptions at the time the Representation is made?

iv. AESO clarification

- Response to questions regarding the Representation:
  - We are still working on the process of the integration of DOS into the SASR process, but it would likely be in the Stage 2 area that we would accept the Representation.
  - Regarding the signing of the Representation, it would likely be an officer of the company that would sign off on it. The Representation sits with the director or officer that signs off on it. The AESO would perform the monitoring and audit of DOS usage using the existing monitoring processes set up for monitoring and audit of compliance to ISO rules.
  - The Representation is the agreement that you will not be using DOS in place of DTS. If you can no longer represent that, the requirement would be for you to discontinue your use of DOS. You may need to provide an update on the description of your use of DOS – we would allow that ability to update some of the other data that's provided in the application.
  - The application would contain the Representation. The Representation is a standard statement that's not written by the customer. Customers sign off on it saying their use of DOS is appropriate.

v. Stakeholder commentary

- Some participants were concerned with the AESO's proposed solution of a 20 per cent load factor to mitigate DTS cannibalization:
  - *Power Advisory:* The 20 per cent load factor was a point in the sand – has the AESO looked at higher maximum load factors that still maintain the stop from DTS cannibalization? I understand you have to draw from somewhere but to use historical data seems unrepresentative as the future use of DOS will be very different from historic use of DOS.
  - *Capital Power:* On slide 26 (Estimated value of the mitigation options), the AESO indicated transition DOS over 20 per cent load factor would cost $17 million for five years. Is it possible to share what the maximum load factor the AESO had to go to for this mitigation option and result?
  - *TC Energy:* We would like a slight increase to the 20 per cent load factor so we're not limiting any opportunities for energy storage.
  - *CanREA:* If the 20 per cent is not chosen appropriately, does it not potentially discriminate against certain technologies and is therefore not agnostic?

Public

- *TC Energy:* I don't think that just because you've exceeded your 20 per cent threshold that DTS is economic for you. A positive margin may not be significant enough to cover your fixed costs. We have to be careful that we're not talking short-term economics, we're talking long-term economics.
- *Power Advisory:* Year to year, you'll have different opportunities in different years. While the load factor might look firm from a historic viewpoint, that's not necessarily the case. Would like to see an example done for energy storage just to understand how the AESO will monitor this.

vi. AESO clarification

- Response to questions regarding the 20 per cent load factor:
  - The AESO came to the conclusion that 20 per cent was the right level. We've seen up to 20-30 different customers on DOS which is a fair sample of historical use. There were two other guides we used to help set 20 per cent: one was how much of the DTS capacity is used on a regular basis and the other was the statistical assessment of where in our load represents inefficient load, both of which are also around 20 per cent.
  - The 20 percent load factor determination did not consider specific technologies. It is an assessment of what is an appropriate quantitative replacement for "short-term and temporary use" clause in existing DOS in order to remove the subjectivity in application process.
  - We're looking to set up a modernized DOS that provides opportunity to use the service for those who wouldn't have been able to otherwise without creating the risk of cannibalization of DTS.

vii. Stakeholder commentary

- There was discussion around how DOS applies specifically to energy storage:
  - *AUC:* My understanding is that for certain energy storage applications, some of the ancillary services are load. If energy storage is participating in these ancillary services, will DOS be turned off for these ancillary services?
  - *BluEarth Renewables:* On Slide 41 (DTS contract level will be determined by the customer), regarding the risk of de-qualification ancillary services under DOS, how would the AESO view energy storage's application as ancillary service provider under modernized DOS? Is this a binary view- energy storage can not be qualified as an ancillary service provider under DOS?

viii. AESO clarification

- Response to questions regarding energy storage:
  - Energy storage can provide ancillary services both on the supply side and demand side. What the AESO is cautioning is that one of the requirements for ancillary services is that it needs to be reliably there. If all you have is DOS energy and if you're in a state for using this DOS energy and we recall this energy, you could lose the potential to provide the ancillary service. Customers need to be careful if they're looking to participate in the ancillary services market to consider that not having any DTS may result in a qualification risk.

Public

Topic 3: What we heard – Session 6A

i. Stakeholder commentary

- Clarifying comments:
  - *MATL Canada:* Haven't heard much in terms of the impacts of costs of exporting energy from Alberta. Will there be increases to the cost of exporting energy from Alberta? If that's the case, we'd like to understand how the AESO will determine the XOM (Export Opportunity Merchant Service) or XOS (Export Opportunity Service) charges. Because export prices can be price sensitive, has the AESO assessed how the reduced export volumes would result in higher charges?
  - *TC Energy:* We need to know what the magnitude of change will be. It's important that the parties have an opportunity to be consulted on the changes to rate XOS before we end up in the proceeding.
  - *Best Consulting Solutions:* What is meant by "Alberta's electricity use cases" on Slide 75 (Areas of Alignment & Misalignment – Energy Storage Treatment)?

ii. AESO clarification

- Response to clarifying comments:
  - We have put out a spreadsheet that identifies what the DTS and DOS rates are going forward. Similar to DOS where we're not reviewing or changing the rate derivation methodology for other opportunity services. We're not reviewing the overall methodology, but we can give you information on what we think the changes will be.
  - Regarding Slide 75, the AESO copied the bullet from a previous presentation (Session 4, slide 41) when we were referring to the use cases energy storage can provide; meaning more the value stacking or attributes they're able to monetize.

Topic 4: Next steps

i. Stakeholder commentary

- Clarifying comments:
  - *TransAlta:* Does the AESO plan to formally respond to all of the AUC's information requests before filing?
  - *CanREA:* The AESO has said that they will only make one filing. Would the AESO be open to other mechanisms that could allow for earlier approval of the modernized DOS?

ii. AESO clarification

- Response to clarifying comments:
  - Regarding the AUC's information requestions, if you go back to previous materials, the AESO has tied responses to specific questions from the Commission.
  - In the spirit of achieving regulatory efficiency, the AESO will consider the best filing strategy for the ISO tariff and modernized DOS recommendation.

Public

Individual Site Bill Impact Tool

This bill impact tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document[1] in effect, the authoritative document governs.

1 Purpose

This bill impact tool is intended to allow ratepayers to assess historical annual impact with respect to the AESO's preferred bulk and regional tariff rate design ("Preferred Rate Design") described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 published on March 18, 2021 and presented in the corresponding AESO's Stakeholder Session 5 on March 25, 2021.

The purpose of this bill impact tool is to allow a market participant to estimate the annual historical charges for system access service under the AESO's Preferred Rate Design, including Rate DTS, *Demand Transmission Service* , and Rate PSC, *Primary Service Credit* .

The calculations in this bill impact tool provide estimated charges under the Preferred Rate Design only. The AESO calculates certain actual charges on an hourly basis rather than on average annual amounts, and ***actual charges under any future tariff design may differ from the estimated amounts presented in this bill impact tool*** .

2 Current Design and Preferred Rate Design Rate Calculations

Current Design (Test Year 2019) and Preferred Rate Design (Test Year Future) rates are calculated using actual 2019 billing detemrinants for all sites and 2019 revenue requirement. The rates only differ by changing the functionalizaiton and classification from current approved in the 2021 ISO tariff to the preferred rate design.

3 Completing the Individual Site Bill Impact Tool

This section describes how a market participant may complete the bill impact tool to estimate and compare annual charges (based on historical load information) for system access service under the existing 2021 ISO Tariff bulk and regional tariff design and under the AESO's Preferred Rate Design.

Initial Steps

Paste single site annual billing determinants on cell "A2" of the 'Site Data Input' tab.
This summary data can be provided by the AESO (in coordination with the DFO if necessary)

In the Technical Information Session on March 31, 2021, the AESO will provide examples and a detailed walk through of the bill impact tool.

The information included in the 'Site Data Input' tab will allow calculations on the 'Annual Summary' tab and will provide annual summary of bill impact resulting from the preferred rate design.

Adjusting Input Data

The 'Adjust Load Profile' tab provides the opportunity to override historical load profile or billing determinant information.

For assistance with this tool and Site Data Input data, please contact the AESO at: tariffdesign@aeso.ca

Attachments

Annual Summary - Summary of bill impact by year
Adjust Load Profile - Allow ratepayers to override input values to assess impact
Site Data Input - Tab to allow annual billing or load profile information by year

Revision History

Date	Description
2021-03-18	v 0.1 - Initial release with draft Test Year 2019 values
2021-03-22	v 0.2 - Fixed to work with all Excel versions and Contract Capacity to pull appropriate year selected (not just 2019)
2021-03-30	v 0.3 - Fixed to ensure adjusted load profile data aligned with results from 'Adjust Load Profile' data
2021-04-06	v 0.4 - Fixed to pull actual annual average pool price into 'Adjust Load Profile' tab

[1] "Authoritative document" is the general name given by the AESO to categories of documents made by the AESO under the authority of the *Electric Utilities Act* and associated regulations, and that contain binding legal requirements for either market participants or the AESO, or both. Authoritative documents include: the ISO rules, the reliability standards and the ISO tariff.

Individual Site Bill Impact Tool

This bill impact tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document[1] in effect, the authoritative document governs.

1 Purpose

This bill impact tool is intended to allow ratepayers to assess historical annual impact with respect to the AESO's preferred bulk and regional tariff rate design ("Preferred Rate Design") described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 published on March 18, 2021 and presented in the corresponding AESO's Stakeholder Session 5 on March 25, 2021.

The purpose of this bill impact tool is to allow a market participant to estimate the annual historical charges for system access service under the AESO's Preferred Rate Design, including Rate DTS, *Demand Transmission Service*, and Rate PSC, *Primary Service Credit*.

The calculations in this bill impact tool provide estimated charges under the Preferred Rate Design only. The AESO calculates certain actual charges on an hourly basis rather than on average annual amounts, and ***actual charges under any future tariff design may differ from the estimated amounts presented in this bill impact tool***.

2 Current Design and Preferred Rate Design Rate Calculations

Current Design (Test Year 2019) and Preferred Rate Design (Test Year Future) rates are calculated using actual 2019 billing detemrinants for all sites and 2019 revenue requirement. The rates only differ by changing the functionalizaiton and classification from current approved in the 2021 ISO tariff to the preferred rate design.

3 Completing the Individual Site Bill Impact Tool

This section describes how a market participant may complete the bill impact tool to estimate and compare annual charges (based on historical load information) for system access service under the existing 2021 ISO Tariff bulk and regional tariff design and under the AESO's Preferred Rate Design.

Initial Steps

Paste single site annual billing determinants on cell "A2" of the 'Site Data Input' tab.
This summary data can be provided by the AESO (in coordination with the DFO if necessary)

In the Technical Information Session on March 31, 2021, the AESO will provide examples and a detailed walk through of the bill impact tool.

The information included in the 'Site Data Input' tab will allow calculations on the 'Annual Summary' tab and will provide annual summary of bill impact resulting from the preferred rate design.

Adjusting Input Data

The 'Adjust Load Profile' tab provides the opportunity to override historical load profile or billing determinant information.

For assistance with this tool and Site Data Input data, please contact the AESO at: tariffdesign@aeso.ca

Attachments

Annual Summary - Summary of bill impact by year
Adjust Load Profile - Allow ratepayers to override input values to assess impact
Site Data Input - Tab to allow annual billing or load profile information by year

Revision History

Date	Description
2021-03-18	v 0.1 - Initial release with draft Test Year 2019 values
2021-03-22	v 0.2 - Fixed to work with all Excel versions and Contract Capacity to pull appropriate year selected (not just 2019)
2021-03-30	v 0.3 - Fixed to ensure adjusted load profile data aligned with results from 'Adjust Load Profile' data
2021-04-06	v 0.4 - Fixed to pull actual annual average pool price into 'Adjust Load Profile' tab

[1] "Authoritative document" is the general name given by the AESO to categories of documents made by the AESO under the authority of the *Electric Utilities Act* and associated regulations, and that contain binding legal requirements for either market participants or the AESO, or both. Authoritative documents include: the ISO rules, the reliability standards and the ISO tariff.

5-Year Average 12-Coincident Peak

This illustrative tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document[1] in effect, the authoritative document governs.

1 Purpose

This illustrative tool is intended to allow stakeholders to understand and assess the concept of the 5-Year Average 12-Coincident Peak ("CP") ("5-Year 12CP Average") (described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 published on March 18, 2021 and presented in the corresponding AESO's Stakeholder Session 5 on March 25, 2021, and Technical Session II on March 31, 2021.)

The description and explanations in this illustrative tool provide estimate calculations under the Preferred Rate Design only (as described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 ("Preferred Rate Design"). The AESO calculates certain actual charges on an hourly basis rather than on average annual amounts, and ***actual charges under any future tariff design will differ from the estimated amounts presented in this illustrative tool***.

2 Use of 5-Year Average 12CP Illustrative Tool

This section describes how stakeholders may use this illustrative tool to understand the 5-Year 12CP Average included in the AESO's Preferred Rate Design.

Calculations - 5yr Average-Tariff Coincident Metered Demand (TCMD)

This tab describes the calculations for the 5-Year 12CP Average proposal and how it could be rolled out in a future tariff design.

Actual Load at Time of CP (Actual Coincident Metered Demand) and Rolling 5yr Average (Tariff Coincident Metered Demand)

Use the 'Actual Load at time of CP-ACMD' tab to enter values and calculations for the 5-Year 12CP Average is calculated in the 'Rolling 5yr Average-TCMD' tab

Differences

The 'Differences' tab calculates difference between ACMD and 5-Year 12CP Average (TCMD)

For assistance with this tool and Site Data Input data, please contact the AESO at: tariffdesign@aeso.ca

Revision History

Date	Description
2021-04-13	v 0.1 - Initial release

[1] "Authoritative document" is the general name given by the AESO to categories of documents made by the AESO under the authority of the *Electric Utilities Act* and associated regulations, and that contain binding legal requirements for either market participants or the AESO, or both. Authoritative documents include: the ISO rules, the reliability standards and the ISO tariff.

5-Year 12CP Average Calculations

Definitions:

ACMD	Actual MWs at time of system demand (Rate DTS and Rate FTS) is greatest (at time of (a) 15-interval or (b) 1-hour interval)
TCMD	Calculated value resulting from calculations proposed as AESO Preferred Rate Design

Rolling Out Period (Years 1 - 4):

Year 1 TCMD $TCMD_{Month} = Average(\ [Year\ 1]ACMD_{Month}\ ) = [Year\ 1]ACMD_{Month}$

Year 2 TCMD $TCMD_{Month} = Average(\ [Year\ 2]ACMD_{Month}, [Year\ 1]ACMD_{Month})$

Year 3 TCMD $TCMD_{Month} = Average(\ [Year\ 3]ACMD_{Month}, [Year\ 2]ACMD_{Month}, [Year\ 1]ACMD_{Month}\ )$

Year 4 TCMD $TCMD_{Month} = Average([Year\ 4]ACMD_{Month}, [Year\ 3]ACMD_{Month}, [Year\ 2]ACMD_{Month}, [Year\ 1]ACMD_{Month}\ )$

Year 5 TCMD . . . $TCMD_{Month} = Average([Year\ 5], ACMD_{Month}, [Year\ 4]ACMD_{Month}, [Year\ 3]ACMD_{Month}, [Year\ 2]ACMD_{Month}, [Year\ 1]ACMD_{Month}\ )$

Approach proposed to classify transmission costs between demand and energy

The following methodology is proposed to determine the share of costs classified as demand and energy in the preferred rate design, as presented at Session 5 on March 25, 2021. The AESO is sharing this further information to increase understanding on this aspect of the preferred design.

Premise

The minimum system is that required to meet peak load and is classified to demand related billing determinants. Infrastructure beyond the minimum system is that required to support the in-merit flow of energy across the province and is classified to an energy related billing determinant.

The following methodology has been developed to characterize the share of costs attributable to the minimum system required to meet peak load (demand) and the share of costs attributable to facilitating the in-merit flow of energy (energy).

Methodology

Peak demand and peak generation in a year is identified from hourly metered DTS load and hourly metered generation by planning area. The hour at which an area experiences peak demand may or may not be different from the hour when the area experiences peak generation, and these hours may or may not differ by planning area. Planning areas are described in the map below.

The aggregated peak load and positive differences between peak load and peak generation by area estimates the proportion of the minimum system relative to the actual system and the resulting cost classification for Alberta:

- If peak generation minus peak load is negative, then for this classification methodology the transmission system is deemed to primarily serve load for this area. The system in the area is the minimum system, resulting in the transmission for this area being 100% demand related, since the demand related transmission is at least as large as the energy related transmission. (Example area 1)

- If peak generation minus peak load is positive, then for this classification methodology the transmission system is greater than the minimum system and is deemed to both serve peak load and to facilitate in merit flow of energy for this area. The incremental peak generation above peak load is used to characterize the amount of system, above the minimum system, facilitating in merit energy and represents the portion classified to energy. In other words, the actual system in this area is deemed to be greater than the minimum system needed to serve demand. (Example area 2)

This information from each planning area is aggregated to determine the share of network costs (currently referred to as Bulk & Regional costs) classified to demand and energy.

Public

As further description, a simplified example considering Alberta is made up of two areas is included below.

Example Area 1:

	Hour of Occurrence	Area Load (MW)	Area Generation (MW)
Area Peak Load	X	120	80
Area Peak Gen	Y	100	100

Peak generation (MW)	Peak Load (MW)	Difference (MW, if negative, then 0)	Area Classification to Demand (Peak Load) (MW)	Area Classification to Energy (Difference) (MW)
100	120	0	120	0

Public

Example area 2:

	Hour of Occurrence	Area Load (MW)	Area Generation (MW)
Area Peak Load	A	50	120
Area Peak Gen	B	40	150

Peak generation (MW)	Peak Load (MW)	Difference (MW, if negative, then 0)	Area Classification to Demand (Peak Load) (MW)	Area Classification to Energy (Difference) (MW)
150	50	100	50	100

Public

The above is completed for all 42 planning areas to determine the overall classification to demand and energy. In this example there are just two areas.

	Classification to Demand (MW)	Classification to Energy (MW)
Area 1	120	0
Area 2	50	100
Total	**170**	**100**
System Classification	**63% (170/270)**	**37% (100/270)**

This estimates the classification to demand and energy applied to the network cost (the bulk and regional portion of wires costs). The resulting classification for 2020 are 60 per cent demand and 40 per cent energy, and have changed minimally since 2015. The AESO is proposing to update the estimate of the percentage classification once every five years, and use that estimated percentage in the annual rates updates.

Bill Impact Analysis Assumptions:

1. Analysis completed by FortisAlberta based on its Transmission Cost Allocation method and Rate Design to DT rate classes as currently approved by the Commission.
2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in FortisAlberta's 2021 Annual PBR rate filing) as summed across all FortisAlberta D-connected PODs .
3. Range of Estimated % Impact to T component of FortisAlberta's DT will vary based on individual customer's load characteristics / billing determinants and were calculated using a modified version of the bill impact 4.2 series schedules as filed in FortisAlberta's 2021 PBR Rates Filing.
4. The underlying Low, Typical and High load factor and usage scenarios used to determine bill impacts in Columns D through L are for illustrative purposes only, and provide a reasonable range of potential impacts for the majority of customers in the DT rate class.
5. FortisAlberta Rate 65 - Transmission Connected Service customers that are served by a dedicated AESO POD and receive a direct flow-through of the AESO's DTS tariff can estimate their bill impacts using the AESO-provided bill impact tool.

FortisAlberta Inc. DISCLAIMER:

1. FortisAlberta Inc. provides the information contained in this schedule for informational purposes only for those participating in the AESO Bulk and Regional Tariff Design Stakeholder Engagement. The information provided in this document is not intended as advice to, or concerning, particular customers or circumstances. The information contained in this workbook is provided on an "as is" basis, without warranty or condition of any kind, either express or implied, including warranties of completeness, accuracy, usability, fitness for a particular purpose or merchantability. The user of the information assumes all risk for the use of this information. FortisAlberta, on behalf of its affiliates, officers, directors, employees, agents, consultants and contractors, completely disclaims all liability for the use of the information provided in this workbook by any recipient, including liability for any losses, damages, lawsuits, claims or expenses, including, but not limited to, consequential losses anyone may incur as a result of using this information.

2. The information provided in this schedule has been provided only to assist FortisAlberta distribution tariff customers, participating in the AESO Bulk and Regional Tariff Design Stakeholder Engagement, in assessing potential bill impacts to the transmission component of FortisAlberta's distribution tariff that may result if the AESO's preferred DTS rate design is approved. The information contained in this bill impact schedule is provided only for this express purpose and may not be used, or relied on, for any other purpose. No party may reproduce, alter, or publish the information contained in this doument without the express prior written consent of FortisAlberta Inc.

3. FortisAlberta notes that the estimated bill impacts for individual distribution-connected customers will vary from the estimates provided in this workbook as a result of actual demand, kWh usage and load factor at the FortisAlberta Point of Service and the actual approved rates. Further, FortisAlberta notes that the information in this workbook will also vary if any changes are made to the transmission component of FortisAlberta's distribution tariff, as approved from time to time by the Commission.

Attention: Nicole LeBlanc
Director, Markets & Tariff

Dear Ms. LeBlanc:

Re: AESO Bulk and Regional Tariff Design Stakeholder Engagement
ENMAX Power Corporation ("EPC") Analysis of Potential Distribution Tariff Bill Impacts

EPC provides the attached analysis of potential bill impacts in response to requests from the AESO and customers in the Bulk and Regional Tariff Stakeholder Engagement ("Stakeholder Engagement"). The attached bill impact analysis provides an estimate of the potential range of impacts to the transmission component of an individual customer's bill based on the AESO's preferred DTS rate design relative to the AESO's test year rates as presented in Session #5 of the Stakeholder Engagement.

As noted in the Disclaimer section of the bill impact analysis, EPC is providing this information for the sole purpose of assisting EPC distribution tariff customers, participating in the Stakeholder Engagement to assess their potential bill impacts to the transmission component should the AESO's preferred DTS rate design be approved. EPC consents to the AESO distributing this bill impact analysis to parties participating in the Stakeholder Engagement and it being posted to the AESO website. The information contained in this bill impact analysis is not to be used for any other purpose. Please contact me should you have any additional questions at 403-390-7748.

Regards,

Wesley Manfro
Regulatory Specialist, Regulatory Applications

Bill Impact Analysis Assumptions:

1. Analysis completed by EPC based on its Transmission Cost Allocation method and rate design to DT rate classes as currently approved by the Commission.
2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in EPC's 2021 Annual PBR rate filing) as summed across all EPC D-connected PODs.
3. Range of Estimated % Impact to T component of EPC's DT will vary based on individual customer's load characteristics / billing determinants and were calculated using a modified version of the bill impact schedules filed in all EPC rate applications.
4. The underlying low, typical, and high load factor and usage scenarios used to determine bill impacts in Columns D through L are for illustrative purposes only, and provide a reasonable range of potential impacts for the majority of customers in the DT rate class.
5. EPC's D600 rate class receive direct flow-through of the AESO's DTS tariff and can be estimated using the AESO-provided bill impact tool.

EPC Disclaimer:

1) EPC provides the information contained in this schedule for informational purposes only for those participating in the AESO Bulk and Regional Tariff Design Stakeholder Engagement. The information in this document is provided on an "as is" basis, without warranty or condition of any kind, either express or implied, The user of the information assumes all risk for the use of this information. EPC, on behalf of its affiliates, officers, directors, employees, agents, consultants or contractors, disclaims all liability for the use of the information provided, including liability for any losses, damages, lawsuits, claims or expenses.

2) The information provided in this schedule has been provided only to assit EPC distribution tariff customers, participating in the AESO Bulk and Regional Tariff Design Stakeholder Engagement, in assessing potential bill impacts to the transmission component of EPC's distribution tariff that may result if the AESO's preferred rate design is approved. The information contained in this bill impact schedule is provided only for this express purpose and is not to be used for any other purposes. Without EPC's prior written consent, parties receiving this information will not, directly or indirectly, disclose the information to any person or entity.

3) EPC notes that the estimated bill impacts for individual distribution-connected customers will vary from the estimates provided in this workbook as a result of actual demand, energy usage, and load factor and the actual approved rates. Further, EPC notes that the information in this workbook will also vary if any changes are made to the transmission component of EPC's distribution tariff, as approved from time to time by the Commission.

Historical DOS statistics

Number of transaction requests by type:

Type	# of Sites	# of transaction requests
DOS 7 minute	31 (2 sites currently)	2501
DOS 1 hour	11 (last used in 2004)	207
DOS term	22 (1 site currently)	66

DOS recalls occur for three primary reasons:

1) supply adequacy (Energy Emergency Alert (EEA) events)
2) real-time transmission constraint
3) voltage support

Number of recalls by reason:

Year	Reason	# of DOS recalls
2006 - 2012	Supply Adequacy	32 EEA events
	Constraint and Voltage	70
2013 - 2021	Supply Adequacy	41 EEA events
	Constraint and Voltage	1*

*Information on transmission constraint frequency resolved by in merit generation is available in the *Estimated Cost of Constraint* report on ets.aeso.ca

Bill Impact Assumptions

1. Analysis completed by EPCOR based on its aprooved System Access Service Cost of Service and Rate Design methodology.

2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in EPCOR's 2021 Annual PBR rate filing) as summed across all EPCOR Distribution-connected PODs

3. Range of Estimated % Impact to Transmission component of EPCOR's DT will vary based on individual customer's load characteristics / billing determinants and were calculated using the bill impact schedules as filed in EPCOR's 2021 Annual PBR Rates Filing.

4. The underlying low, typical, and high load factor and usage scenarios used to determine bill impacts in Columns D through O are for illustrative purposes only, and provide a reasonable range of potential impacts for the majority of customers in the DT rate class.

5. EPCOR's Direct Connect (DC) to Transmission System Customers receive direct flow-through of the AESO's DTS tariff and can be estimated using the AESO-provided bill impact tool.

EPCOR Disclaimer

1) EPCOR provides the information contained in this schedule for informational purposes only for those participating in the AESO Bulk and Regional Tariff Design Stakeholder Engagement. The information in this document is provided on an "as is" basis, without warranty of condition of any kind, either express or implied. The user of the information assumes all risks associated with for the use of this information. EPCOR, on behalf of its affiliates, officers, directors, employees, agents, consultants or contractors, disclaims all liability for any errors or omissions in or the use of the information provided, including liability for any losses, damages, lawsuits, claims or expenses and assumes no obligation to update forward looking information.

2) The information provided in this schedule has been provided only to assist EPCOR distribution tariff customers, participating in the AESO Bulk and Regional Tariff Design Stakeholder Engagement, in assessing potential bill impacts to the transmission component of EPCOR's distribution tariff that may result if the AESO's preferred rate design is approved. The information contained in this bill impact schedule is provided only for this express purpose and is not to be used for any other purposes. Without EPCOR's prior written consent, parties receiving this information will not, directly or indirectly, disclose the information to any person or entity.

3) EPCOR notes that the estimated bill impacts for individual distribution-connected customers will vary from the estimates provided in this workbook as a result of actual demand, energy usage, and load factor and the actual approved rates. Further, EPCOR notes that the information in this workbook will also vary if any changes are made to the transmission component of EPCOR's distribution tariff, as approved from time to time by the Commission.

Notice

To: AESO Stakeholders

Date: Tuesday, May 25, 2021

Subject: **NERA Economic Consulting Report on Estimated Customer Response to Preferred Rate Design**

Further to the AESO's presentation of its Preferred Bulk and Regional Tariff Rate Design at its March 25, 2021 Stakeholder Session 5, the AESO received stakeholder feedback and certain questions from the Alberta Utilities Commission ("AUC") staff with respect to self-supply response to the Preferred Bulk and Regional Tariff Rate Design. In response to this feedback and the AUC questions, the AESO has posted a report prepared by NERA Economic Consulting entitled: Estimating Customer Response to Our Recommended Bulk and Regional Tariff Design (the "Customer Response Report"). The Customer Response Report will be discussed as part of the AESO's upcoming Bulk and Regional Tariff Design Stakeholder Session 6A on June 3, 2021, where stakeholders will have the opportunity to provide feedback on the report during that session and afterwards. The AESO is providing the Customer Response Report in advance of Stakeholder Session 6A to provide stakeholders additional time to review the document in advance of providing Session 6A materials on May 27, 2021. This is consistent with the AESO's Transparent and Timely Stakeholder Engagement Principle to assist stakeholders in understanding and evaluating the AESO's Preferred Bulk and Regional Tariff Rate Design.

Please direct any questions to tariffdesign@aeso.ca.

1. Executive Summary

1. NERA Economic Consulting ("NERA") has been asked to estimate the likely customer response and potential changes in self-supply outcomes by load arising from the Bulk and Regional tariff design that we recommended to the Alberta Electric System Operation ("AESO"), as described at the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5. In this report, we describe our analysis of the anticipated customer response to the change in transmission tariff.

1.1. Our recommended tariff should encourage more efficient self-supply decisions by customers

2. Customers can reduce their costs of electricity by choosing to self-supply and generate power at their own premises instead of purchasing power from the grid. A customer's decision to self-supply balances the benefit associated with not consuming power from the grid with the additional costs that the customer incurs to self-supply power. A customer's choice to self-supply may be efficient and lower the total costs of electricity provision if the avoided system costs of serving that customers' self-supplied load from the grid exceeded the costs incurred by the customer to self-supply over the long-run.

3. However, customers cannot know the costs that their demand imposes on the grid. They rely on regulated transmission and distribution tariffs and wholesale market prices to signal, to the extent possible, the costs incurred to supply them. Therefore, transmission charges which are cost-reflective will tend to encourage overall efficient self-supply decisions by customers.

1.2. Marginal cost approaches to transmission tariff design may not promote efficient self-supply decisions without locational pricing

4. In theory, a marginal cost approach to transmission tariff design should send an efficient price signal, that reflects the costs imposed by incremental changes in demand on the system, through a charge which varies with customers' consumption behaviour. The remaining costs should be recovered in a way that avoids distorting the consumption decisions that customers take in response to the marginal cost component of the tariff.

© NERA Economic Consulting

5. Changes in customers' demands have different impacts on transmission system costs, depending on where they are located. The AESO provides transmission capacity to move electricity from areas where the supply of in-merit energy exceeds demand, to areas where demand exceeds supply. Therefore, increasing demand in areas of surplus in-merit energy may reduce transmission costs (implying a negative marginal cost), while higher demand increases transmission costs in areas where demand exceeds supply (implying a positive marginal cost).

6. In developing our recommended Bulk and Regional tariff methodology, we have been asked to assume that rates do not differ based upon the location of load on the transmission system. In the absence of the ability to differentiate the marginal cost component of the tariff by location, a tariff that reflects the marginal cost of transmission would be unable to account for the fact that the marginal cost of accommodating demand in some areas is likely to be positive, while the marginal cost of accommodating demand in other areas may be zero or even negative.

7. Therefore, a marginal cost-based tariff that applies in all areas cannot reflect these differences and therefore cannot send efficient signals regarding the marginal transmission costs associated with accommodating changes in demand in Alberta.

1.3. An embedded cost approach encourages efficient, long-run self-supply decisions

8. By contrast, an embedded cost methodology seeks to signal to customers the long-run costs of providing transmission, in a way that identifies which costs have been incurred historically to accommodate (or have been caused by) particular patterns of usage, particular customers and/or particular services. By ensuring that the structure of tariffs (the balance between fixed, demand-related, and energy-related tariffs), reflects the cost structure of the transmission grid, the tariff can encourage efficiency in users' self-supply decisions.

9. In the AESO's case, it is currently charging for the majority of transmisison costs through a 12CP charge, to an extent that is not justified on grounds of cost causation as explained in the Stakeholder Session 5 presentation. The current tariff is therefore promoting inefficient self-supply decisions aiming to avoid 12CP charges. By

contrast, our recommended tariff better reflects the dual purposes of transmission in Alberta: to meet peak demand and accommodate the flow of in-merit energy.

10. However, even if the tariff is designed to reflect the cost structure of the transmission system, and therefore promote efficient decisions to use the grid or self-supply in the long-term, there remains a possibility that a tariff set to recover historical costs will cause customers to inefficiently self-supply in cases where those customers make lower contributions to historical costs. We therefore estimate customer response to our recommended tariff using a modelling procedure.

1.4. We estimate that customer response to our recommended tariff is likely to be extremely limited

11. In order to better assess how customers may respond to our recommended transmission tariff, we model the optimal self-supply decisions for industrial sites in Alberta. Our approach follows three steps:

    A. Step 1: We construct a model that estimates the optimal self-supply decisions for industrial sites across Alberta, based on a simple comparison of the costs of purchasing power from the grid and self-generation costs.

    B. Step 2: However, this optimisation model overstates the actual self-supply for customers because we do not model other costs associated with self-supply such as costs and risks associated with business complexity or financing. To estimate how customers' actual self-supply decisions will be affected by a change in the transmission tariff, we estimate a regression equation to capture how likely customers are to self-supply, given the economic incentive to self-supply identified in Step 1.

    C. Step 3: We then use our regression to predict customers' response to the change in incentive to self-supply under our recommended tariff.

12. We estimate that self-supply could increase under our recommended tariff by up to 2,801 GWh which is equivalent to a shift in costs from self-supplying customers to other customers of approximately 1.90 per cent of the total revenue requirement for bulk and regional costs in 2019. Our estimate of customer response is a total effect

that includes any dynamic responses[1] by customers to self-supply decisions of other customers.

13. Our estimate of customers' response is conservative because it ignores the potential for customers to increase purchases of power from the grid in response to lower 12CP charges in our recommended tariff relative to the current tariff.

14. Hence, we predict an extremely limited increase in self-supply by industrial customers under our recommended tariff, and any change in customers' self-supply decisions that does arise will tend to result in more efficient patterns of electricity usage than under the current methodology.

1.5. The economic case for self-supply is likely to significantly worsen in the next decade due to rising gas and carbon prices

15. While the impact of our recommended tariff on self-supply is likely to be limited given the current costs of self-supply, the economic case for self-supply in Alberta is likely to worsen in the next decade, even under a low energy consumption growth scenario. Both carbon and gas prices are forecast to rise over the next decade. For instance, we understand that the Federal Government has announced that, under its carbon tax regime, taxes will increase from $30 per tCO2 to $170 per tCO2 in 2030.

16. The impact of future growth in gas and carbon prices on incentives to self-supply depends on how the costs of self-supply change relative to the pool price. Higher carbon and gas prices will increase the pool price for power, as generators incur higher costs to produce power, thereby increasing the cost savings associated with self-supply. On the other hand, rising gas prices and carbon prices will also result in higher costs of self-supply using gas-based generation, decreasing the cost savings associated with self-supply relative to purchasing power from the grid.

17. Gas-based generation options available for self-supply are generally smaller and therefore less efficient (requiring more gas to produce one unit of electricity) than grid-level generation plants. Consequently, the costs of self-supplying power will

[1] By the term "dynamic response", we refer to our modelling procedure accounting for some customers' decisions to self-supply pushing up tariffs for other customers, leading them to self-supply too. Our reported results consider these knock-on effects of the initial change in the tariff to our recommended design.

increase more than the pool price in response to higher carbon and gas prices, because self-suppliers require more gas (and release more emissions) to generate one unit of electricity.

18. We estimate that rising carbon and gas costs will make self-supply technologies more expensive over time, when compared to the cost of purchasing power from the grid. For two representative self-supply technologies, we estimate that by 2030, the fuel and carbon costs of producing one MWh using self-supply plant will be $25.40 or $32.47 per MWh (in real 2019 terms) more expensive respectively than producing a MWh using grid technology, relative to around $10 per MWh today. Therefore, we expect that upward pressure on fuel and carbon prices is expected to further reduce the incentive to self-supply.

2. Introduction

19. We have been asked by the Alberta Electric System Operator ("AESO") to estimate the likely customer response and potential changes in self-supply outcomes by load arising from our recommended Bulk and Regional tariff design, described at Bulk and Regional Tariff Design Stakeholder Engagement Session 5. In this report, we describe our analysis of the anticipated customer response to the change in transmission tariff.

20. Our report is structured as follows:

    A. In Section 3, we discuss the factors that may influence a customers' decision to self-supply including the costs of self-supply options and the costs of purchasing power from the grid, and determine whether such decisions are efficient:

        i. In Section 3.1, we discuss the definition of efficient and inefficient self-supply decisions.

        ii. In Section 3.2, we discuss the ability of marginal and embedded cost tariff methodologies to promote efficient self-supply decisions in the Alberta context.

        iii. In Section 3.3, we provide a short discussion of current self-supply choices made by customers in Alberta under the current tariff.

        iv. In Section 3.4, we analyse the impact of our recommended tariff on the decision to self-supply. We provide the results of our modelling procedure developed to examine how changes in the AESO's tariff affect self-supply decisions by industrial customers. Overall, we find that any reduction in energy demand from the transmission system resulting from changing to our recommended tariff design is likely to be extremely limited, based on the current costs of self-supply.

        v. In Section 3.5, we examine how incentives to self-supply are likely to change in the future due to forecast changes in the economics of self-supply. We find that the economics of self-supply are set to worsen in the future, even under a low consumption growth scenario, because self-supply technologies are

impacted by rising carbon prices to a greater extent than grid level technologies.

B. In Section 4, we summarise our findings.

C. In Appendix A, we provide a detailed description of our modelling procedure used to estimate customer response, as reported in Section 3.4.

3. Customer Response to the Tariff

3.1. The Decision to Self-Supply

3.1.1. A customers' decision to self-supply

21. Customers can reduce their costs of electricity by choosing to self-supply and generate power at their own premises instead of purchasing power from the grid. A customer's decision to self-supply balances the benefit associated with not consuming power from the grid with the additional costs that the customer incurs to self-supply power.

22. Customers that choose to self-supply incur costs to do so. The costs of self-supply may include:

    A. The upfront **capital costs** associated with building or procuring a generator to use for self-supply, which would usually be depreciated and financed over the useful life of the generator;

    B. The **fixed annual operating and maintenance (O&M) costs** of generating power using the installed generator;

    C. The **variable costs** associated with generating power which may include the variable O&M costs of the generator, the costs of fuel for the generator, and the carbon costs associated with using fossil fuel generation; and

    D. **Other costs** associated with self-supply such as the costs of land for the generator, personnel, administrative costs, and costs associated with any additional complexity and risk to business operations relative to purchasing power from the grid.

23. The costs of self-supply may also be offset if an industrial customer uses a bi-product from generating its own power in its industrial processes. For instance, industrial customers that self-supply power using cogeneration technology may also benefit from using heat and/or steam in industrial processes.

24. A customer that chooses to self-supply also avoids the costs of purchasing that self-supplied power from the grid. A customer that chooses to consume power from the grid incurs multiple costs, that primarily consist of:[2]

    A. **Energy costs** associated with purchasing energy from the pool;

    B. **Transmission charges** as defined by the ISO tariff for use of the transmission system;

    C. **Distribution charges**, paid by distribution connected customers, for the use of the distribution system;

    D. **Local access fees** which are fees charged by municipal districts to customers in those service areas; and

    E. **Administrative charges**, for customers which purchase energy through an electricity retailer, associated with the billing and administration of the customer's account by the retailer.

25. The costs that customers avoid from self-supplying and incur from purchasing power from the grid depend on how and when they use electricity:

    A. Depending on their connection to the system, customers may not have to pay all of the above charges when consuming electricity from the grid.

        i. A transmission connected, industrial customer purchasing power from the grid would incur energy costs and transmission charges.

        ii. An industrial customer purchasing power from the grid but connected to a distribution system might incur energy costs, transmission charges, and distribution charges.

    B. Customers pay different amounts in energy, transmission, and distribution charges depending on when they purchase electricity from the grid. For instance, customers consuming at peak times will likely pay higher energy costs because the pool price tends to be higher and may also pay more in transmission charges if they consume during times of coincident peak. Other charges, such as a flat

[2] AESO (31 May 2020), Delivered Cost of Electricity Report, p. 15.

rate energy charge would be incurred irrespective of when customers consume from the grid.

C. Charges levied per customer do not vary depending on how much or when the customer consumes energy from the grid. Such charges are difficult to avoid through self-supply decisions, unless customers disconnect from the grid entirely.

D. Charges levied on billing capacity do not vary with customers' energy consumption across all hours, but do vary with customers' contracted capacity or peak energy consumption across the year. However, customers choosing to self-supply may reduce their contracted capacity as having generation on-site may reduce their reliance on the grid for peak requirements.

26. Therefore, customers incur different costs to self-supply and avoid different costs associated with purchasing power from the grid, depending on how and when they choose to self-supply.

27. A customer's decision to self-supply is not a binary decision. There are multiple different ways that a customer could self-supply that each result in a different net consumption profile from the grid. We distinguish four approaches and technologies that could be used to self-supply:

A. **Intermittent generation:** Customers could install intermittent generators to self-supply such as rooftop solar photovoltaic (PV) generators. The profile of such generation is not controllable by the customer and therefore the customer would still need to connect to the grid or install other forms of on-site generation that could run when the intermittent resource is not available. The customer would avoid paying some costs when it was generating, such as energy charges in the transmission tariff and the pool price. However, it would tend not to avoid peak charges, except to the extent that the generator happens by chance to be producing at peak time.

B. **Peaking generation:** Customers could install peaking generators characterized by low capital costs but high variable costs of generation. Customers can choose when to run peaking generation and would likely use it to reduce their consumption during peak periods, when they can avoid network charges linked to

coincident peak load, energy charges, and energy costs associated with higher pool prices. However, peaking generators will be less economic to run in off-peak periods meaning customers would likely remain connected to the grid and consume power from the grid during those times.

C. **Baseload generation:** Customers could install baseload generators, characterized by higher capital costs but lower variable costs of generation relative to peaking generators. Baseload generators will be economic in more hours than peaking generators, and could be used to self-supply in all hours throughout the year. However, customers deploying baseload technologies for self-supply would still need to be connected to the grid as they would be reliant on the grid for back-up in cases where their generator suffers a forced outage. Customers with baseload generation would avoid most energy costs and charges, apart from the occasions where it relied on the grid for back-up, and peak charges, unless it needed to use the grid for back-up during a peak period. However, customers would remain liable for any per customer, per connection, or contract capacity charges as they would remain connected to the grid. As we discuss above, customers may also utilise baseload generation to produce bi-products for use in industrial processes.

D. **Disconnection or grid defection:** Lastly, customers could completely disconnect from the grid, and rely entirely on their own power generation capacity. Customers that disconnect from the grid would avoid all energy costs, transmission charges, and distribution charges. However, they may incur higher costs to self-supply, as they would need to have technology in place to operate in an "islanded" mode of operation, without the ability to draw on the grid for support.

28. Customers can also avoid taking power from the grid at certain times to avoid charges, but without investing to self-supply. Management of load, by reducing or eliminating power consumption, can be used to avoid coincident peak charges which are levied on consumption during small time intervals throughout the year, or the purchase of energy at relatively high pool prices. However, customers would need to be able to predict when such time intervals occur. In management of their load at any

moment in time, customers face a trade-off between the opportunity cost of using power and the savings associated with avoiding the charges levied.

29. Customers may also invest in energy storage options to complement self-supply technologies or to help them manage their load and avoid periods of time associated with relatively higher costs of purchasing power from the grid.

30. Customers' decisions on how and whether to self-supply depend on their individual circumstances, namely how and when they consume power from the grid. A customer considering whether to self-supply could choose a combination of the approaches to self-supply (listed in Paragraph 27 above) to best meet its energy requirements.

31. In making self-supply decisions, a customer's load size is also an important determinant of the self-supply options available to it. The upfront capital costs of some self-supply options, e.g. baseload generators, often make them uneconomic for customers with smaller loads. Customers with smaller loads may be limited to smaller back-up/peaking plant, intermittent generation options, and load management. On the other hand, larger industrial and commercial customers are more likely to be able to pursue a wider range of self-supply options, including peaking and baseload generation or disconnection from the grid.

32. Customers are also constrained in their decisions to self-supply by other factors. Space and land availability may constrain the use of some self-supply options, such as the use of solar PV for larger industrial loads. Local emissions limits may also restrict the self-supply options available to customers. Lastly, industrials may face capital constraints in funding the upfront capital costs of self-supply options.

33. From the customers' perspective, optimal decisions to self-supply balance the costs incurred to generate their own power with the avoided costs of purchasing power from the grid. We would expect customers to take a holistic decision of whether to self-supply based on all the benefits and avoided costs of purchasing power from the grid (i.e. not just the transmission tariff).

    A. If the customer incurs fewer costs to self-supply than it would to purchase power from the grid (accounting for any associated benefits of self-supply, such as heat supply), then the customer would optimally choose to self-supply.

B. If the customer incurs more costs to self-supply than it would to purchase power from the grid (even after accounting for associated benefits of self-supply), then the customer would optimally choose not to self-supply.

34. Given that self-generation decisions typically involve investment in long-lived generation assets, we would expect a customer's decision on whether to self-supply to consider a forward-looking assessment of the costs of self-supply relative to the avoided costs of consuming from the grid.

3.1.2. Efficient and inefficient self-supply decisions

35. Economics defines a concept named "productive efficiency".[3] A market is productively efficient when it meets the demand from customers at lowest possible cost. The power market would achieve productive efficiency if customers' loads are met at lowest possible system costs, irrespective of which parties incur those costs.

36. It is not necessarily inefficient for the system if customers choose to self-supply. In fact, a customer's choice to self-supply may be efficient and lower the total costs of electricity provision:

A. A customer choosing to self-supply would improve productive efficiency if the avoided system costs of serving that customers' self-supplied load from the grid exceeded the costs incurred by the customer to self-supply over the long-run (net of any other costs and benefits from doing so, such as the value of heat); whereas

B. A customer choosing to self-supply would reduce productive efficiency if the avoided system costs of serving that customers' self-supplied load from the grid are less than the customer's incurred costs to self-supply over the long-run (net of any other costs and benefits from doing so, such as the value of heat).

37. Customers cannot know the costs that their load imposes on the grid. They rely on regulated transmission and distribution tariffs and wholesale market prices to signal, to the extent possible, the costs incurred to supply them. Therefore, transmission

[3] See for instance, Michael. J. Farrell (1957), The Measurement of Productive Efficiency, Vol. 120, No. 3, p. 253-290.

charges which are cost-reflective will tend to encourage overall efficient self-supply decisions by customers.

38. Following a change in the transmission tariff, customers may make different, and *more efficient*, self-supply decisions in response to a transmission tariff that itself better reflects the costs of transmission incurred to serve that customer's load. For instance, compared to the current tariff, our recommended tariff reduces costs recovered through a charge on 12CP in order to better meet principles of cost causation. Consequently, customers are more incentivised to consume power from the grid during times of coincident peak, thereby reducing inefficient self-supply decisions relative to the current tariff.

39. In its Distribution System Inquiry, the Alberta Utilities Commission (AUC) distinguishes customers' decisions to self-supply by whether they constitute "economic" or "uneconomic bypass" from the grid.[4] The AUC defines uneconomic bypass:[5]

> *"uneconomic bypass describes a situation where a customer's bypass decision (i.e., supplying its needs through other means) shifts fixed cost recovery, whether in whole or in part, to other customers. This occurs when a customer's decision to self-supply electricity does not change (or even increases) system costs, but results in that customer paying a smaller share of the fixed costs. This unrecovered fixed cost must then be collected from other customers"*

40. The AUC defines "economic bypass":[6]

> *"In contrast, economic bypass occurs when a customer supplying its needs through other means results in reduced costs for other customers. This happens when a customer's decision to self-supply electricity lowers system costs; so it is not only the self-supplying customer who is paying less for the system costs, but the costs for other customers are also reduced"*

4 AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 97 and 98.

5 AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 97.

6 AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 98.

41. As we discuss above, our recommended tariff seeks to more accurately signal the long-run costs of providing transmission in Alberta. Self-supply decisions in response to cost reflective tariffs promote efficiency in the overall supply of electricity, and will tend to reduce the costs faced by the customers who purchase energy from the grid. Changes to customers' self-supply decisions in response to our recommended tariff should therefore tend to be more efficient than under the current tariff, resulting in incentives that will encourage what the AUC terms economic bypass (and discourage uneconomic bypass) in the long-run than the current tariff design.

42. However, even though our recommended tariff seeks to better reflect the cost structure of the transmission system than the existing tariff in order to promote efficient decision-making on customers' usage of the grid or self-supply decisions, there remains a risk of inefficient self-supply decisions. Specifically, any tariff has to recover the current operating and historically incurred capital costs of the transmission system in Alberta. If the costs incurred historically are higher than the costs that would be associated with the costs of meeting customers' demands for electricity in the future, then there is a risk that any tariff set to recover historical costs will cause customers to self-supply.

43. In other words, customers that respond to the price signals sent by the recommended tariff design might make lower contributions to historical costs, thereby shifting recovery of those costs to other customers. As explained below, marginal cost pricing provides a potential solution to this challenge that has been discussed in the context of distribution tariff reform in Alberta.

3.2. Marginal Cost Tariffs as a Possible Means of Promoting Efficient Self-Supply Decisions

3.2.1. Theory suggests marginal cost tariffs promote efficient self-supply decisions

44. Economic theory, and the practical application of rate design in North America and elsewhere, sometimes uses a "marginal cost approach" as a potential solution to this problem of historical costs exceeding the forward-looking costs associated with future changes in demand for electricity. The marginal cost approach sets tariffs based on an

estimate of how a change in demand from a customer will affect the future costs of the utility.[7]

45. A theoretical advantage of a marginal cost approach is the ability to send an efficient price signal that reflects the costs imposed by incremental changes in demand on the system. This price signal should be sent through a charge which is "avoidable" or varies with customers' consumption behaviour. In theory, these prices promote efficiency by allowing customers to trade-off the benefits they derive from consuming electricity drawn from the transmission system, which may include the value derived from consumption or the costs of alternative self-generation options, against the transmission costs their consumption creates (as well as other costs such as the wholesale market price).

46. The concept of marginal cost-based pricing is discussed in the context of distribution network rate design in the AUC's Distribution System Inquiry:[8]

> *"distribution rates should contain a variable component to provide a forward-looking price signal to customers to manage their use of distribution system services that will affect the future costs of the network. This forward-looking component is based on variable charges (volumetric charges or avoidable demand, such as CP charges)"*

47. However, setting prices equal to an estimate of marginal cost will not usually (except by coincidence) generate enough revenue to recover the revenue requirement.[9] The difference between the revenue earned under marginal cost prices and the revenue requirement is often called the "residual" costs.

48. Consequently, in order to recover the revenue requirement efficiently, the marginal cost methodology prescribes that the residual should be recovered in a way that avoids distorting the consumption decisions that customers would take in response to the

---

7 National Association of Regulatory Utility Commissioners (NARUC), Electric Utility Cost Allocation Manual, January 1992, pp. 12-14.

8 AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 311.

9 NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 147.

efficient price signals conveyed by marginal cost component of the tariff alone. As explained in the AUC's Distribution System Inquiry:[10]

"Whenever an attempt is made to recover embedded or sunk costs (also referred to as "residual costs" in the quote above) through charges that customers can avoid (such as volumetric charges or CP demand charges), improper incentives (i.e., incentives contrary to the public interest in the least cost provisioning of electricity) arise to invest in self-supply, resulting in (i) under-recovery of fixed system costs; (ii) cost shifting to other customers; and (iii) uneconomic bypass"

49. In light of the above, methods to recover residual costs in a marginal cost-based tariff include:

A. Ramsey pricing, which recovers residual costs based on the relative elasticities of demand for different classes of customers.[11] Those classes with the highest price sensitivity will be charged the price closest to marginal cost (hence recovering less residual cost) while those that are least likely to respond to price will be charged the price that deviates the most from marginal costs (reflecting more residual costs).[12]

B. However, recognising that it can be challenging to identify the price elasticity of demand for all customers, the tariff could recover residual costs based on a charge levied on a billing determinant which is least likely to distort customer behaviour (and the price signal sent by the marginal cost component of the charge).[13]

C. Another method to recoup residual costs is to apply a proportional mark-up to the marginal-cost component of the charge.[14] While this approach is simple to administer, and can result in a similar outcome to Ramsey pricing if customer classes that impose the highest marginal costs also have the least price elastic

[10] AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 310.

[11] The elasticity of demand describes the extent to which customers can and are willing to change their behavior to avoid the charge. A higher elasticity of demand refers to a customer that is more willing to change their behavior to avoid the charge.

[12] NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 155-160.

[13] NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 162.

[14] NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 160-162.

demand, this methodology distorts the marginal cost price signal, and so undermines the efficiency properties of marginal cost pricing.

50. The choice of methodology to recover residual costs should also consider the equity of the tariff design.[15] For instance, levying a fixed charge per customer may disproportionately impact smaller customers relative to larger ones.

3.2.2. Challenges of applying a marginal cost approach to set the AESO's tariff

51. While the marginal cost approach is theoretically appealing as a means of encouraging efficient self-supply decisions, the current legislative framework in Alberta significantly limits the potential benefits of using a marginal cost approach in the AESO's tariff.

52. The efficiency of a marginal cost approach to set a regulated utility tariff that will apply to a wide set of customers (e.g. across a whole "class" of ratepayers) relies on the assumption that all such customers' consumption decisions would have a similar impact on the utility's costs. For instance, in a distribution system, it is reasonable to assume that changes in customers' consumption decisions (or growth in the number of customers) will have a similar effect on the distribution utility's costs because the majority of residential electricity customers have similar sized connections and are served with similar types of infrastructure.

53. In a transmission system, by contrast, it is not safe to assume that changes in all customers' demands have the same impact on the transmission system's costs:

A. New demand connecting to the system in a location that is close to new generation may help the AESO to avoid the need to reinforce the transmission system to evacuate power from the new generation facility. As such, the marginal cost of accommodating this particular change in demand would be negative.

B. On the other hand, additional energy consumption in locations near generators due for retirement, or in locations where demand is already high relative to the

[15] NARUC, Electric Utility Cost Allocation Manual, January 1992, p. 164-165.

generation located nearby, may increase transmission costs. The marginal cost of accommodating such changes in demand would be positive.

54. In practice, the investments that the AESO identifies in the 2020 Long Term Plan (LTP) suggest that changes in customers' consumption decisions (e.g. demand, energy) in different locations of the network could be associated with different amounts of avoidable costs. For instance, while the AESO is currently only planning a single investment in the Northeast planning region to support voltage, it is planning multiple new single-circuit lines to alleviate *load* thermal constraints in the Northwest, two new bulk line circuits in the Central planning region to alleviate *generation* thermal constraints, and a new regional line in the Calgary planning region to alleviate *load* thermal and voltage constraints. Hence, changes in customers' consumption decisions in Calgary are unlikely to drive the same change in transmission costs associated with the identified investments in the Northwest as changes in customers' consumption decisions in the Northwest.

55. In developing our recommended Bulk and Regional tariff methodology, we have been asked to assume that rates cannot differ based upon the location of load on the transmission system. In absence of the ability to differentiate the marginal cost component of the tariff by location, a tariff that reflects the marginal cost of transmission would be unable to account for the fact that the marginal cost of accommodating demand in some areas is likely to be positive, while the marginal cost of accommodating in other areas may be zero or even negative.

56. Therefore, the marginal cost component of the tariff would inevitably differ from the marginal cost of transmission investment associated with accommodating an additional unit of demand at that particular location of the network. As such, a tariff set using a marginal cost approach would not necessarily lead to an efficient outcome.

57. To take a practical example, the electricity transmission pricing methodology in Great Britain sets tariffs that seek to approximate the long-run marginal cost of transmission, such that transmission users receive a forward-looking signal regarding the costs they impose on the grid. However, the primary purpose of these forward-looking signals is to send locational signals regarding the long-run investment cost

users impose on the grid in different *locations*, with charges for demand customers varying from £20.38 to £61.68 ($35.33 to $106.91) per kW per year, depending on location.[16] Customers also pay a non-locational charge per kW to cover residual costs.

58. Hence, even if marginal cost-based distribution tariffs may have the potential to encourage the efficient use of distribution systems in Alberta, the legislative framework in Alberta limits the potential benefits of a marginal cost methodology to set *transmission* tariffs. The relative importance of locational signals at the transmission system level compared to the distribution system level is recognised in the Distribution System Inquiry:[17]

> *"experts indicated that while there may be merits of locational pricing on the transmission system, there probably is much less value in locational pricing on the distribution systems, at this time"*

59. Whilst we assess that the use of a marginal cost-based approach for transmission pricing in Alberta is principally limited by the inability to vary the marginal cost component of the tariff by location, using such a methodology to set transmission tariffs would also entail challenges associated with the recovery of the remaining residual costs:

    A. The large increase in transmission investment seen since 2014 has not been accompanied by significant growth in coincident peak demand.[18] Over this historical period, load growth has also been relatively low. Consequently, we would expect a tariff based on a marginal cost approach to have a small marginal cost component and large residual cost component. Large residual cost components of the tariff create challenges for the recovery of those costs, whilst

[16] Half-hourly demand tariff reported for zones in Northern Scotland and South Western in Transmission Network Use of System Tariffs in 2021-22. See: National Grid (January 2021), Final TNUoS Tariffs 2021-22, Table 9. Currency converted using current exchange rate of GBP 1: 1.73 CAD.

[17] AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 317.

preserving the efficient price signal sent by the marginal cost component of the tariff.

60. As we explain above, under a Ramsey pricing approach, residual costs could be recovered from customers in proportion to their estimated price elasticities of demand (higher charges levied on customers with lower price elasticities of demand). However, estimating the price elasticity of demand for different customer groups is difficult in practice. Moreover, it involves levying costs on customer classes based on their willingness and/or ability to respond to charges. This approach would not seek to follow principles of cost causation but instead target the minimal customer response to the residual component of the tariff. The approach may also raise equity concerns.

61. Hence, a more practical implementation might be to levy the residual costs on billing determinants that are less likely to produce a response from the customer. For instance, the Distribution System Inquiry states that residual costs should be recovered from billing determinants that are non-avoidable, or difficult to avoid, such as fixed monthly charges or "non-bypassable demand charges" such as non-coincidental peak demand or contract capacity charges.[19]

62. However, unlike distribution systems, a relatively small number of customers are connected to the transmission system, and they vary materially in terms of their size usage of the system. For instance, transmission customers comprise small and large industrials, some of which make very little use of the grid except as a back-up to on-site generation, as well as distribution systems. Therefore, levying a fixed fee per customer or connection point to recover transmission residual costs would not follow principles of cost causation, and is likely to lead to inequitable charges as small customers would make the same financial contribution to residual costs as much larger customers.

63. In addition, it is not clear whether any billing determinant would be truly "non-avoidable" for many transmission customers. As explained above, large industrial customers that connect directly to the transmission system can choose to reduce their coincident or non-coincident demand by self-generating, or disconnecting from the

[19] AUC (19 February 2021), 24116-D01-2021, Distribution System Inquiry, para. 309.

grid and self-supplying the entirety of their energy needs. High transmission charges could also make it uneconomic to operate within Alberta. Hence, even a fixed charge per customer per month may be avoidable for a large industrial customer connected to the transmission grid.

64. As noted above, as an alternative to recovering residual costs from the customers with least price elastic demand or the billing determinants that are least avoidable, an alternative approach would be to use proportional mark-ups to uplift marginal cost-based tariffs. In this case, it is likely that proportional mark-ups would need to be large given the relative size of residual costs relative to marginal costs. Therefore, proportional mark-ups will likely significantly distort any price signal sent by the marginal cost component of the charge.

65. However, as noted above, the limitations associated with efficient recovery of residual costs are secondary to the limitations associated with the inability of the transmission tariff to accurately reflect marginal cost unless it has locational differentiation.

3.2.3. The lack of locational pricing would restrict or negate the efficiency benefits from the AESO introducing a marginal cost methodology

66. Economic theory shows that marginal cost prices may send more efficient signals to consumers of the impact of changes in load on the costs of transmission. However, these theoretical benefits of a marginal cost approach cannot be realised in the AESO's context, if rates of the transmission tariff do not differ based upon the location of load on the transmission system.

67. In simple terms, the AESO provides transmission capacity to move electricity from areas where the supply of in-merit energy exceeds demand, to areas where demand exceeds supply. Increasing demand in areas of surplus in-merit energy may therefore reduce transmission costs (implying a negative marginal cost), while higher demand increases transmission costs in areas where demand exceeds supply (implying a positive marginal cost). A marginal cost-based tariff that applies in all areas cannot reflect these differences and therefore cannot send efficient signals regarding the marginal transmission costs associated with of accommodating changes in demand in Alberta.

© NERA Economic Consulting

3.2.4. An embedded approach will tend to promote more efficient self-supply decisions than a marginal approach in the Albertan context

68. The AESO's current tariff methodology is an embedded cost approach. In contrast to the marginal cost approach, which aims to set a forward-looking signal regarding the additional costs that would be associated with future load growth, the embedded cost approach designs tariffs based on historical spending on capital investment and operating expenses during a specific time period.[20]

69. In this context, the embedded cost methodology seeks to signal to customers the long-run costs of providing transmission, in a way that identifies which costs have been incurred historically to accommodate (or have been caused by) particular patterns of usage, particular customers and/or particular services. Embedded methodologies need to be designed to achieve this objective, and thereby send signals to users regarding the historical costs associated with their usage of the transmission grid.

70. By setting charges to reflect the costs incurred historically to serve particular customers or types of grid usage, the embedded methodology can send signals through tariffs that reflect such patterns of cost causation. By ensuring that the structure of tariffs (the balance between fixed, demand-related, and energy-related tariffs), reflects the cost structure of the transmission grid, the tariff can encourage efficiency in users' self-supply decisions.

71. The embedded cost approach is commonly criticized for sending less efficient price signals to consumers, because prices may not reflect the cost of consuming the next unit of electricity. Instead, prices reflect the historical, average cost of service, so consumption decisions made in response to the tariff may be less efficient than if the tariff were set equal to marginal cost. However, in this particular context, i.e. electricity transmission in a jurisdiction where locational differentiation of transmission tariffs is not permitted, this common criticism of the embedded methodology would be unjustified. As we explain above, the AESO's Bulk and

[20] National Association of Regulatory Utility Commissioners (NARUC), Electric Utility Cost Allocation Manual, January 1992, pp. 12-14.

Regional tariff cannot accurately reflect the marginal cost of transmission without differing rates based upon the location of load on the transmission system.

72. Given this limitation of marginal cost-based pricing in this context, an embedded methodology provides a reasonable guide to the costs associated with particular customers' usage of the transmission system. We therefore recommend that a tariff based on an embedded cost approach is more likely to promote efficient self-supply decisions than a tariff based on marginal cost pricing principles.

73. Nonetheless, we quantify the likely effect of our recommended tariff design (as outlined in the presentation delivered at Stakeholder Session 5) on self-supply decisions by customers, as described further below.

3.3. Self-Supply in Alberta

74. As we discuss in Section 3.1.1, industrial customers tend to have a larger number of options to self-supply than residential or small commercial customers because they have larger loads. Industrial customers account for approximately 65 per cent of annual Alberta Internal Load ("AIL"). The remaining load comes from commercial customers (20 per cent), residential customers (13 per cent), and farms (3 per cent).[21]

75. Some industrial customers are already self-supplying under the current tariff. Approximately 24 per cent of annual AIL is self-supplied, or roughly 37 per cent of industrial load.[22] We understand that industrial customers choosing to self-supply include those with petrochemical facilities, pulp/paper and forestry facilities, and oil sands customers. In particular, we understand that oil sands industrial customers have invested in cogeneration self-supply options, and benefit from the production of heat for use in their production processes.[23]

76. The majority of remaining industrial customers which are not pursuing self-supply options are distribution-connected. Approximately 6 per cent of total AIL comes

[21] AESO (31 May 2020), Delivered Cost of Electricity Report, p. 9.

[22] AESO (31 May 2020), Delivered Cost of Electricity Report, p. 9.

[23] AESO (31 May 2020), Delivered Cost of Electricity Report, p. 9.

from transmission-connected industrial customers which are not currently self-supplying.

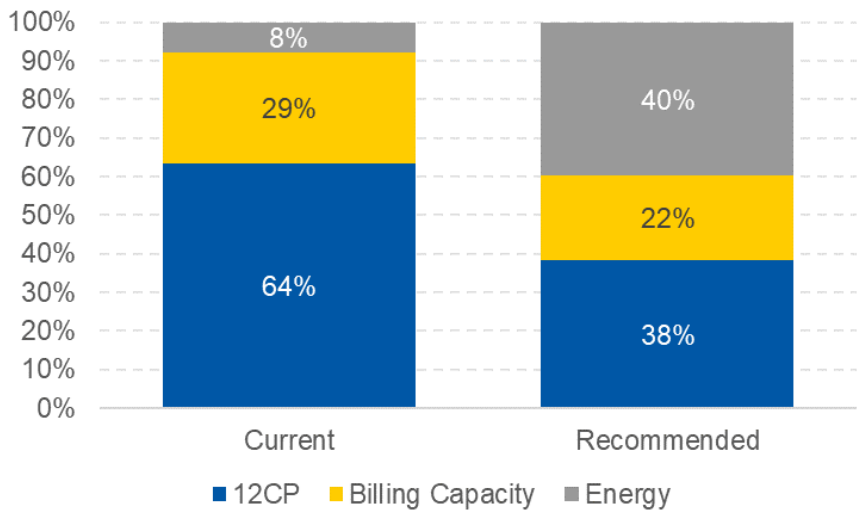
77. In addition to those industrial customers that have already invested in self-supply, other customers are responding to the current transmission tariff by reducing their load at times of 12CP.

3.4. The Recommended Tariff and Self-Supply

3.4.1. Impact of the change of tariff on customers

78. Our recommended tariff design recovers more costs from energy-based charges, and fewer costs from charges levied on billing capacity and 12CP, as illustrated in Figure 3.1 below.

Figure 3.1: Recovery of Bulk and Regional Costs Under Current and Recommended Tariff



Note: Based on 2020 data provided by the AESO. Excludes POD costs. Source: NERA analysis.

79. The change in tariff from the current methodology to our recommended methodology affects what customers pay for electricity in different ways depending on how and when they draw power from the grid.

80. In the panel chart below, we illustrate how our recommended tariff affects the amount that four illustrative customers would pay in transmission charges, assuming no other changes in their consumption behaviour.

A. In Panel A, we illustrate a baseload industrial customer. We construct its load profile from the assumptions used in the AESO's Delivered Cost of Electricity Report, and assume the customer has peak load of 6.77 megawatts (MW) with an average annual load of 4.97 MW (i.e. a load factor of 73 per cent). We assume the customer draws 6.77 MW of energy during times of coincident peak, and also has contract capacity of 6.77 MW.

B. In Panel B, we illustrate a baseload industrial customer, with similar characteristics to that in Panel A, but with average annual load of 6.77 MW (a load factor of 100 per cent).

C. In Panel C, we illustrate an industrial customer using the grid for back-up. The customer has very low average load of 0.35 MW (a load factor of 5 per cent). However, the customer may draw up to 6.77 MW of load at times when it needs to use the grid for back-up. We assume the customer does not use the grid for back-up during times of coincident peak, as defined by the 12 CP hours.

D. In Panel D, we illustrate an industrial customer with the same characteristics as the industrial customer in Panel A, but which avoids paying charges during the 12 CP hours through load management.

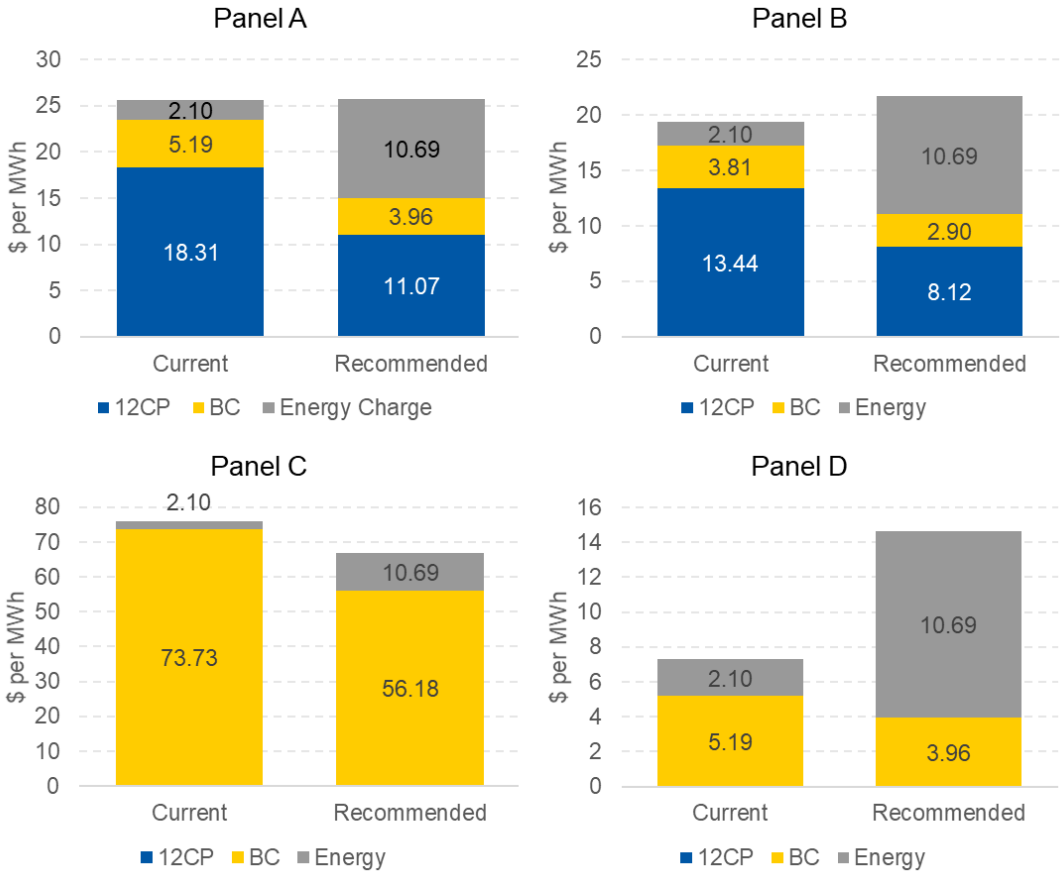
Figure 3.2: Change in Tariffs for Illustrative Industrial Customers



Note: Based on 2020 data. For simplicity, we assume a customers' consumption during coincident peak does not vary across years and therefore the movement to a five-year average 12CP charge does not impact customers charges. Excludes POD Costs. Source: NERA Illustration.

81. Implementing the classification and functionalization of costs envisaged by our recommended tariff design using data for 2020, our recommended tariff design would recover more costs from energy-based charges than the current tariff. Therefore, transmission charges for customers with high load factors and high energy consumption, such as the customer in Panel B would tend to increase under our recommended tariff. Also, customers which have previously avoided 12 CP hours, such as the customer in Panel D, could see a rise in charges under our recommended tariff, which recovers more costs from energy in all hours and fewer costs from charges levied on 12CP.

82. However, because our recommended tariff recovers fewer costs from the 12CP and contract capacity charges, customers with lower load factors that consume at these

© NERA Economic Consulting

times, such as customers in Panel A and Panel C, tend to have lower charges under our recommended tariff.

83. Our analysis suggests that some customers' incentives to self-supply would increase, while other customers' incentives to self-supply would reduce following our recommended change in the tariff.

84. However, our analysis above assumes customers' consumption behaviour does not change in response to the change in tariff. In reality, our recommended tariff design may incentivise customers to change how and when they use the grid:

A. The reduction in the 12CP charge may reduce customers' incentive to avoid consumption at times of coincident peak, thereby increasing usage of the grid at these times;

B. The reduction in the charge on contracted demand also increases customers' incentive to hold contracted capacity to the grid to use the grid as back-up, which may reduce incentives for grid defection; and

C. The increase in the energy charge may decrease customers' incentive to take energy from the grid across the year.

85. Such changes will tend to be efficient in the long-run, because our recommended tariff is more cost reflective than the current tariff for the reasons explained above and in the Stakeholder Session 5 presentation. The more cost reflective price signal will therefore promote more efficient decisions as to whether to self-supply. However, to help the AESO and stakeholders quantify the likely impact of the change in tariff on self-supply decisions, we have performed quantitative analysis to estimate the likely impact on industrial customers' decisions to self-supply resulting from our recommended tariff.

3.4.2. Incentives to self-supply under the current and recommended tariff

86. As explained below in Section 3.4.3, we have considered in detail how the change in tariff will affect all industrial customers' self-supply incentives. However, by way of an example, consider the case of the customer in Panel B above. This customer has a 100 per cent load factor, consuming 6.77 MW in all hours of the year. We assume

this customer is directly connected to the transmission system, thereby incurring only transmission charges and the cost of energy to purchase power from the grid.

87. For the purpose of this illustration, we assume that the customer could choose to self-supply using a baseload gas generator. We adopt the costs of a aeroderivative combustion engine ("ACE") plant with cost assumptions as detailed in the AESO's Cost of New Entrant Analysis.[24] We outline the cost assumptions for this plant in more detail in Appendix A.2.4. Given the customer has a load factor of 100 per cent, we compare the cost per MWh of self-supplying all of its energy with an ACE plant of capacity 6.77 MW relative to purchasing its power from the grid. We assume the customer remains connected to the grid for back-up but does not draw any energy.

88. We illustrate the costs of self-supply relative to purchasing power under the current and our recommended tariff per MWh of consumption across a year in Figure 3.3 below. The figure uses a baseload pool price of $49.39 per MWh, based on the average pool price in 2020.[25]

89. Our analysis suggests that the costs of self-supply across the year for the Panel B customer are below the costs of purchasing power from the grid under both the current and recommended transmission tariff designs. This finding corroborates the AESO's Delivered Cost of Electricity Report, see Figure 3.4 below.[26] The AESO identifies, using a different customer load profile and self-supply technology, that the delivered cost of electricity through self-supply (the purple, yellow, and blue bars) is lower for the illustrative, transmission-connected industrial customer than the costs of purchasing energy from the grid under the current tariff (the purple and yellow bars).

© NERA Economic Consulting

90. However, as we discuss in Section 3.3, only 37 per cent of industrial load is currently self-supplied, despite the suggestion from the analysis above that the economics of self-supply is favourable under the current tariff:

A. Industrial customers with different load profiles have different costs of purchasing power from the grid or self-supplying, as compared to the baseload customer used in the example above.

B. Industrials incur additional costs to self-supply beyond the capital and operating costs required to build and operate self-supply generation units. Other costs may include the costs of land (which may not be available at all close to industrial sites), costs of personnel, and the costs/risks associated with additional business complexity or administration. These costs are additional factors not captured in the above analysis which can lead to industrial customers continuing to purchase power from the grid, even if a simple cost comparison suggests it may be cheaper to self-supply.

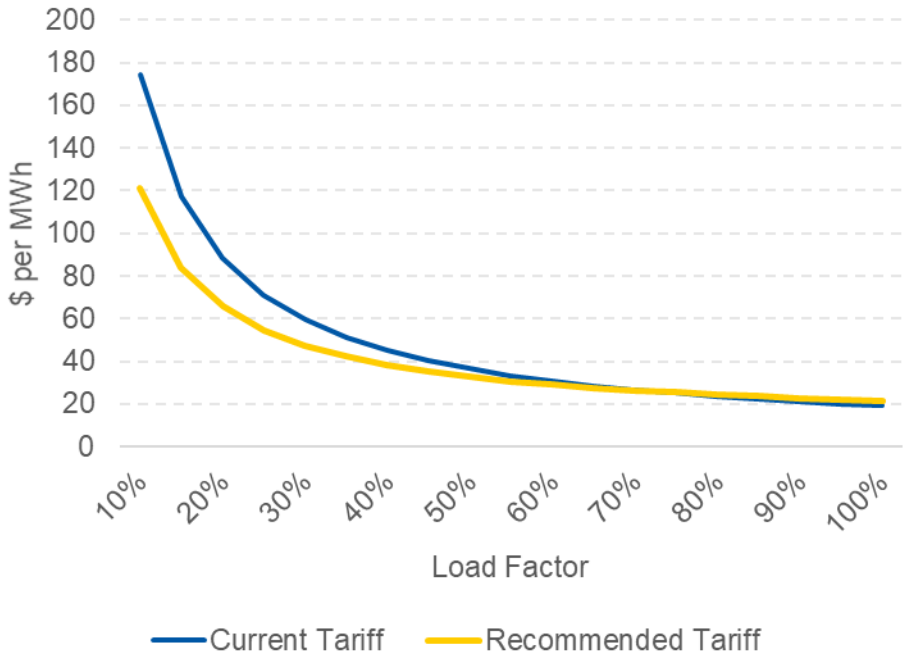
C. On the other hand, the options for customers to self-supply are more diverse than in our analysis above, as customers can choose from an array of technologies to self-supply such as baseload or peaking generation. It is reasonable to assume that customers will choose the least-cost self-supply option across technologies when considering the costs of self-supply compared to purchasing power from the grid.

91. As well as showing that self-supply appears cheaper than purchasing power from the grid, our analysis in Figure 3.3 suggests that the self-supply incentives for customers with a high load factor do not change materially following the change in tariff. Therefore, this illustrative analysis suggests that the increase in costs associated with purchasing power from the grid for a customer with a high load factor is likely to be small.

92. Moreover, for customers with lower load factors like those in Panel A and Panel C, we would expect the customers to face a lower incentive to self-supply, as the cost of purchasing power falls under our recommended tariff relative to the current tariff. In Figure 3.5 below, we illustrate transmission charges for customers with the same

characteristics as the customer in Panel B, with billing capacity and 12CP consumption of 6.77 MW, but with varying load factors. We do not illustrate the costs of purchasing energy from the grid in the Figure. Transmission charges are lower under our recommended tariff for this illustrative customer up to a load factor of between 70 to 75 per cent.

Figure 3.5: Illustrative Transmission Charges for Illustrative Customers with Varying Load Factors Under Current and Recommended Transmission Tariff (2020 C$)



Note: POD Costs Excluded. Source: NERA Illustration.

93. For customers currently avoiding 12CP, such as in Panel D, it is more difficult to determine the impact of the change in tariff on their incentive to self-supply. Whilst these customers face a lower incentive to self-supply during times of coincident peak under the recommended tariff, they face higher costs of purchasing energy from the grid during times other than coincident peak.

3.4.3. Our modelling procedure to estimate the customer response to our recommended tariff

94. In reality, customers' optimal decisions to self-supply are more complicated than the illustrative customer in Figure 3.3 above. Customers with high load factors rarely have 100 per cent load factors, which means their incentives to self-supply depend on cost savings that vary by the hours in which they are consuming power from the grid.

Moreover, because customers take different amounts of energy across hours, it may be optimal for them to install generators that allow them to self-supply all or part of their load, or a combination of types of generators to use in different hours of the year.

95. Therefore, to better assess the potential customer response to the change in tariff we conducted quantitative modelling to analyse how self-supply decisions may change for industrial sites after the introduction of our recommended tariff, which we explain in more detail in Appendix A.

96. Our modelling procedure uses hourly load data provided by the AESO for 133 industrial sites in 2018 and 2019 to assess whether and to what extent it would be economic for each site to self-supply rather than purchase power from the grid across the year, considering both wholesale prices and transmission tariffs. For each customer, we estimate the optimal amount of self-supply under both the current and our recommended tariff to examine how self-supply will change in response to our recommended tariff.

97. However, because our modelling procedure predicts the amount of self-supply based on whether it would be cheaper to self-supply or buy power from the grid, it significantly overstates the tendency for customers to deploy self-supply options. As we discuss in Section 3.1.1, this arises because we do not account for other costs customers face to self-supply that we cannot observe, such as land costs or capital constraints.

98. To address this, we introduce a statistical procedure to estimate how likely customers have been in the past to self-supply, as a function of the potential cost savings a customer could make from self-supplying, based on each customers' characteristics. We assess the performance of our statistical approach by using it to predict existing actual self-supply under the current tariff. We find our approach accurately predicts self-supply (see Appendix A.3.2).

99. We then use our statistical approach to predict actual customer responses to the change in the incentive to self-supply under our recommended tariff.

100. Our analysis focuses on the likely customer response to the increase in the energy charge under our recommended tariff relative to the current tariff. We do not consider

customer response to the decrease in 12CP charges under our recommended tariff relative to the current tariff, except through the extent to which it changes their decisions to optimally self-supply. In other words, we do not consider how decreases in the 12CP charge under our recommended tariff may increase customers' gross load during times of 12CP, and therefore our analysis is conservative with respect to self-supply by customers during times of coincident peak.

101. Overall, our approach predicts an extremely limited increase in self-supply by industrial customers under our recommended tariff. We estimate that self-supply could increase under our recommended tariff by up to 2,801 GWh which is equivalent to 4.69 per cent of the total metered energy billing determinant, used to calculate the transmission energy charge, in 2019.

102. As we explain in Appendix A, our estimate of customer response is a total effect that includes any dynamic responses by customers to self-supply decisions of other customers. This "dynamic response" accounts for the effect of higher self-supply pushing up tariffs levied on the remaining demand, which may increase further the incentives customers have to self-supply.

103. It is also equivalent to a total cost shift of C$ 29.92 million (in real 2019 terms) from self-supply customers to other customers, which is approximately 1.9 per cent of the total revenue requirement for B&R costs in 2019.

104. Therefore, whilst, in Section 3.1.2, we identified the possibility that a tariff set to recover historical costs will cause customers to self-supply, despite sending efficient price signals over the costs of providing transmission in the long run. Our modelling approach suggests that under current system conditions, any reduction in energy demand from the transmission system resulting from our recommended tariff design is likely to be extremely limited.

3.5. Future Trends in the Economics of Self-Supply

105. While the impact of our recommended tariff on self-supply is likely to be limited given the current costs of self-supply, the economic case for self-supply in Alberta is likely to worsen in the next decade.

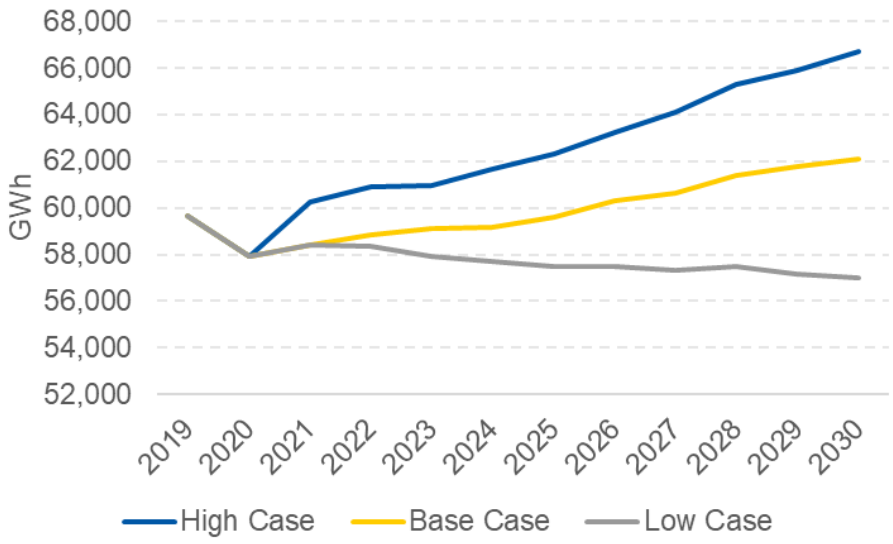
106. As we discuss in Section 3.1.1, customers' decisions to self-supply will necessarily be forward-looking because the upfront capital costs of investing in generators are offset by savings relative to purchasing power from the grid over future years (i.e. over the useful life of the generator). Therefore, not only do the current incentives to self-supply affect a customer's decision to self-supply, but also their expectations regarding future cost savings relative to purchasing power from the grid.

107. We identify two potential drivers of the future costs that customers would incur (and benefits they would obtain) by self-supplying power rather than purchasing it from the grid: future trends in transmission charges and future trends in the variable costs of self-supply.

3.5.1. Future trends in transmission charges

108. The AESO's low growth sensitivity projection of demand transmission service load in Alberta shows declining forecast energy consumption through to 2030, as shown in Figure 3.6. We focus on the low growth scenario to ensure we do not understate the potential for transmission tariffs to rise, and therefore avoid understating customers' incentive to self-supply.

Figure 3.6: AESO's Forecast of Total Energy Consumption



Source: NERA Analysis of AESO Data.[27]

[27] AESO data sourced from its 2020 Q4 Update – Transmission Rate Projection.

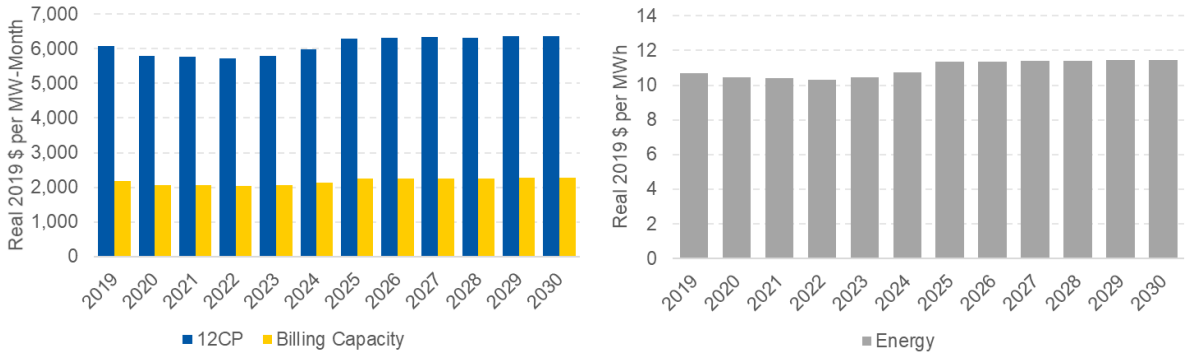
109. Reductions in demand which are coupled with the same revenue requirement can lead to a rise in transmission charges in order to ensure cost recovery. Using the low growth sensitivity forecast, the AESO's forecast revenue requirement, and the same percentage recovery of costs by billing determinant as 2020, we forecast transmission charges under our recommended tariff design.[28] Our forecast is an approximation because, amongst other reasons:

A. We assume the same revenue requirement forecast under the baseline demand projection is appropriate for the low demand forecast projection.

B. We do not account for changes in the classification of costs in our methodology in light of the changing use of the system over the forecast horizon.

110. We illustrate our forecast of transmission charges (in real 2019 C$) in Figure 3.7 below.

Figure 3.7: Forecast Transmission Charges Under Our Recommended Tariff in the AESO's Low Energy Growth Scenario



Note: Source: NERA analysis of AESO data. Inflation forecast from 2020 taken unchanged from the AESO's Rate Projection, and originally sourced from Statistics Canada Table 326-0020, Data Vector V41692327, and Conference Board of Canada Data Vector RPCPIA.

111. Our forecast suggests that transmission charges will rise slightly as energy consumption falls over the period to 2030. In absence of a reduction in other costs of purchasing power from the grid, such as the pool price which may fall with lower energy consumption, higher transmission charges will increase the costs of purchasing

[28] We also construct a low growth sensitivity forecast of coincident metered demand that forms the charging basis of the 12CP billing determinant, and billing capacity. To do so, we examine the ratio of total annual energy consumption and coincident metered demand and billing capacity in the AESO's central projection. We then apply the same ratio to forecast the coincident metered demand billing determinant and billing capacity billing determinant from the low growth forecast of energy consumption.

© NERA Economic Consulting

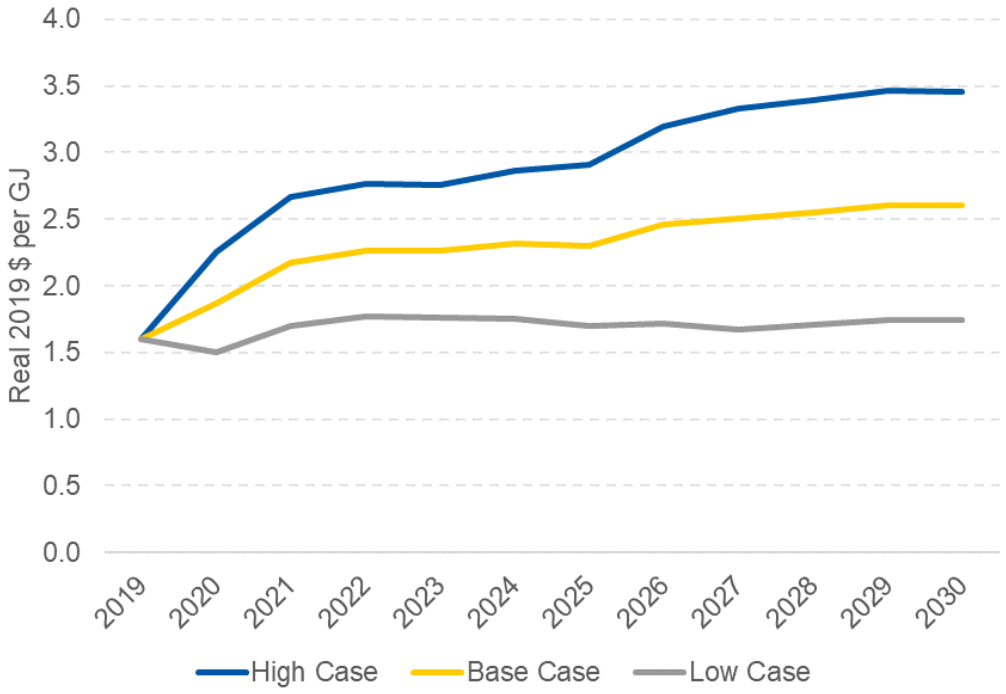
power from the grid for some customers thereby, in theory, increasing the cost savings associated with self-supply.

3.5.2. Future trends in the fuel and carbon costs of self-supply

112. However, the costs of self-supply are also likely to change over this timeframe. Higher costs of self-supply reduce the cost savings associated with self-supply relative to purchasing power from the grid. We identify two key drivers of the costs of generating power to self-supply that are particularly likely to change in the coming years: fuel costs and the carbon price.

113. We have examined the forecast annual average AECO-C natural gas price from 2019 to 2030 as published by the Alberta Energy Regulator (AER).[29] We show the forecast in Figure 3.8 below. As shown, the gas price is forecast to rise in real terms relative to 2021.

Figure 3.8: AER's Forecast AECO-C Natural Gas Price

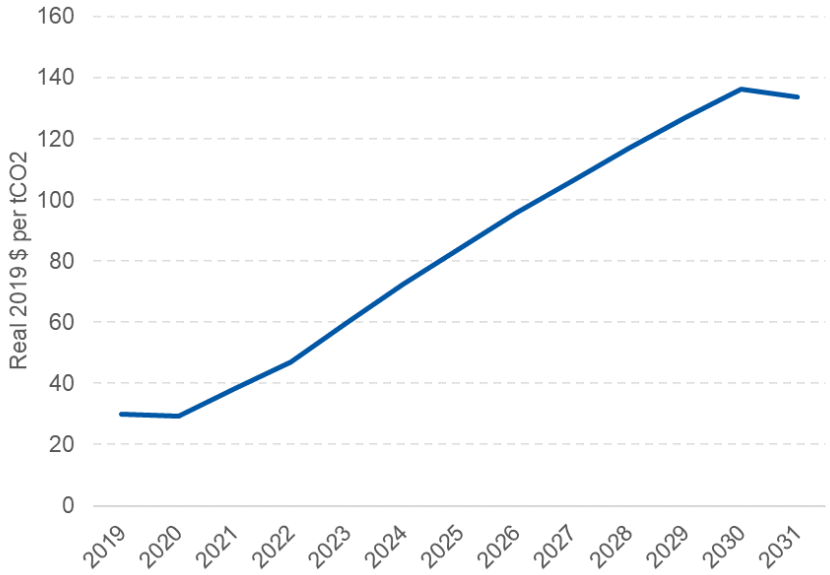


Source: NERA analysis of AER data.

[29] Alberta Energy Regulators Forecast of AECO-C gas prices updated June 2020 and accessed here: https://www.aer.ca/providing-information/data-and-reports/statistical-reports/st98/prices-and-capital-expenditure/natural-gas-prices/aeco-c-price. Last Accessed 12 May 2021.

114. We also examine forecast annual carbon prices. The Federal Government implemented a federal carbon tax through the Greenhouse Gas Pollution Pricing Act in 2018.[30] We understand that under this regime the carbon tax, which is currently $30 per tCO2, is intended to rise to $170 per tCO2 in 2030, with a $10 per tCO2 rise in 2021 and 2022, and a $15 per tCO2 rise per year starting from 2023. We illustrate this rise (in real 2019 C$) in Figure 3.9 below.

Figure 3.9: Forecast Federal Carbon Tax



Source: NERA analysis.

115. The impact of future growth in gas and carbon prices on incentives to self-supply depends on how the costs of self-supply change *relative* to the pool price. Higher carbon and gas prices will increase the wholesale price for power, as generators incur higher costs to produce power. Higher pool prices increase the costs of purchasing power from the grid, and thereby increase the cost savings associated with self-supply. On the other hand, rising gas prices and carbon prices will also result in higher costs of self-supply using gas-based generation, decreasing the cost savings associated with self-supply relative to purchasing power from the grid.

116. To the extent that gas-fired generators are the marginal source of in-merit energy in the wholesale market, the relative efficiency of grid-connected and gas generators

[30] *Greenhouse Gas Pollution Pricing Act*, SC 2018, c 12, s 186.

used to self-supply will drive whether changes in the carbon or gas price will impact the pool price more or less than the costs of self-supply. Customers installing gas generators to self-supply will likely not require, or be able to install, generators of the scale used to generate power for the grid. The smaller generators used to self-supply are likely to be less efficient than the larger generators used to generate power for the grid. Using more inefficient generators means that self-supplying customers will need to use more gas to generate energy relative to grid-serving generators, resulting in higher gas costs and carbon costs per unit of energy generated.

117. To examine this, we compare the heat rates of representative plants that customers could use to self-supply with the heat rates of representative gas plants used to generate power for the system.[31] More specifically, we compare the heat rates of a combined cycle gas plant (CCGT) that we assume would be used to generate power for the grid with the heat rates of an ACE plant and a gas-fired reciprocating internal combustion engine ("RICE") which could be used to self-supply. We detail the assumptions and sources of costs of each plant in Appendix A.2.4. We compare the heat rates in Table 3.1 below.

Table 3.1: Comparison of Heat Rates Across System and Self-Supply Plant

		CCGT	ACE	RICE
Heat Rate	GJ per MWh	6.72	9.68	10.50
Additional Heat Rate Relative to CCGT	*GJ per MWh*		*2.96*	*3.78*

Note: Heat Rates Treated as Net HHV, underlying sources do not specify. Source: NERA Analysis.

118. As the table shows, both ACE and RICE plants require more fuel relative to a CCGT to produce one MWh of electricity. We convert the additional energy requirement per MWh shown in the table to an additional gas requirement per MWh, and then an additional gas cost per MWh using the AER Low Case. We select the Low Case to ensure we do not understate the economic case for self-supply.

[31] The heat rate of a plant specifies how much gas is required to generate a unit of power. Whilst peaking, simple cycle gas plants also generate power for the system, they do so in fewer hours of the year than baseload, combined cycle gas plants which is why we consider baseload plants in our analysis.

119. Given the ACE and RICE plants require more gas to produce one MWh, self-suppliers will also incur more in carbon costs to run the plant. To calculate the additional carbon costs, we assume the ACE and RICE plants are subject to the federal carbon tax, and are also part of Alberta's Technology Innovation and Emissions Reduction ("TIER") regulation, meaning that they only pay carbon taxes on emissions above the "best in gas" standard. We assume the CCGT in our analysis has emissions that meet the best in gas standard.[32] Therefore, because we are examining the carbon costs associated with the *incremental* costs incurred by self-supply technologies relative to a best in gas CCGT, we assume all of the additional gas used by ACE or RICE technologies relative to CCGT will be subject to carbon taxes.

120. To calculate the additional carbon emissions associated with the additional gas required by self-supply technologies, we calculate the extra emissions associated with the higher gas requirement for ACE and RICE technologies relative to CCGT plants, as shown in Table 3.2 below. We then calculate the carbon costs for alternative technologies by multiplying this extra volume of emissions by the carbon price shown in Figure 3.9 above.

Table 3.2: Additional Emissions Associated with Self-Supply

	Units	System CCGT	ACE	RICE
Heat Rate (Net HHV)	GJ per MWh	6.72	9.68	10.50
Emissions Rate	t per MWh	0.338	0.486	0.527
Additional Gas Use Per MWh	GJ per MWh		2.96	3.78
Additional Emissions Per MWh	t per MWh		0.1485	0.1898

**Note: As we discuss in Appendix A.2.4, we recalculate the emissions rate for all plants using (i) tCO2/therm = 0.0053[33] (ii) Btu/therm = 100,000;[34] therm/GJ = 0.105506.[35] Source: NERA Analysis.*

[32] Whilst we recognise that the current "best in gas" standard corresponds to an emissions rate of 0.37 CO2t per MWh, we also understand that the threshold rate should fall over time. Therefore, we assume self-suppliers pay carbon taxes on all fuel use above the emissions rate of the system CCGT of 0.338 CO2t per MWh from the EIA in our analysis.

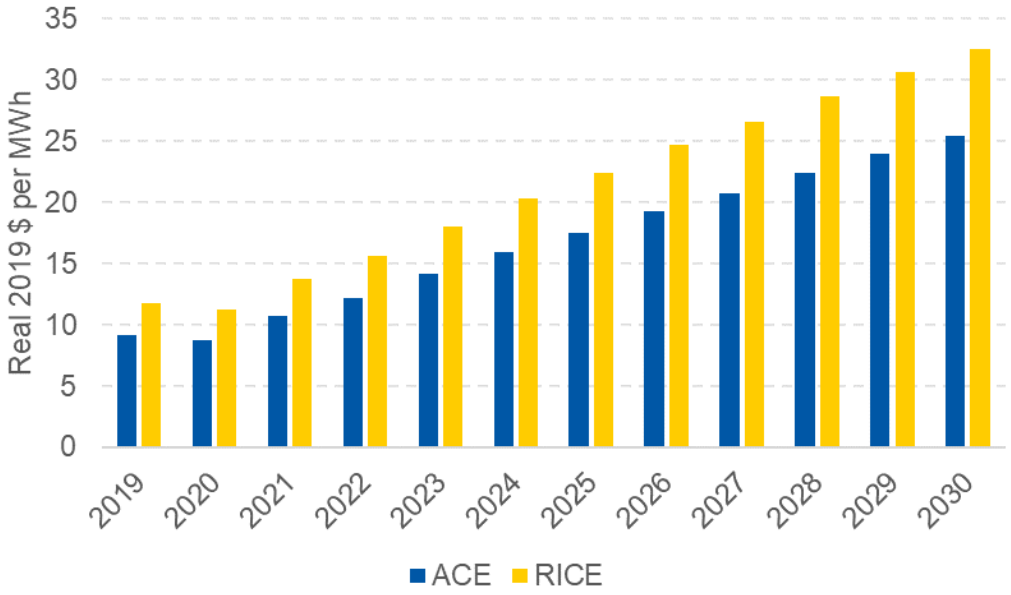
121. We illustrate the additional variable costs of self-supply using the ACE and RICE generator relative to a system CCGT in Figure 3.10 below. The figure shows the additional costs to generate one MWh using self-supply technologies rather than purchasing energy generated using a CCGT, supplied to the customer via the transmission grid.

122. The figure shows that we expect rising carbon and gas costs will make self-supply technologies more expensive over time, when compared to the cost of purchasing power from the grid:

A. By 2030, the fuel and carbon costs of producing a MWh using an ACE or RICE generator will be $25.40 or $32.47 per MWh (in real 2019 terms) more expensive, respectively, than producing that MWh using grid technology, relative to around $10 per MWh today.

B. Therefore, upward pressure on fuel and carbon prices is expected to reduce the incentive to self-supply.

Figure 3.10: Forecast Additional Fuel and Carbon Costs of Self-Supply Relative to CCGT Technology



Source: NERA analysis.

3.5.3. Future trends in the economics of self-supply

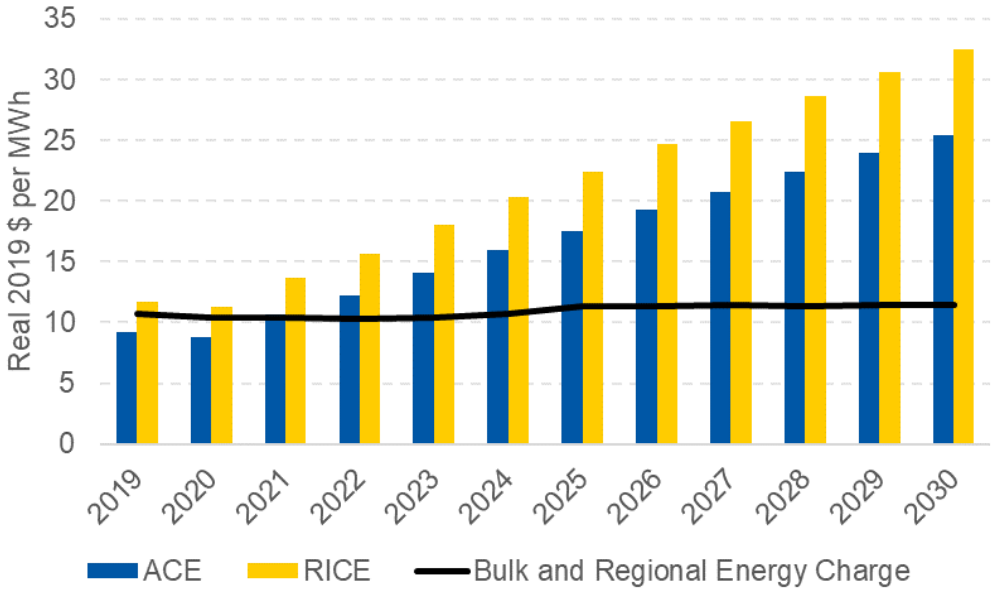
123. We illustrate in Figure 3.11 below the two drivers of future trends in the economics of self-supply:

A. Changes to the energy component of the transmission tariff under our recommended tariff structure,[36] and assuming the AESO's low demand growth scenario (see also Figure 3.7); and

B. The additional fuel and carbon costs of self-supply, driven by changes in gas and carbon prices (see also Figure 3.10).

124. The figure illustrates the additional costs incurred to self-supply one MWh using self-supply technology instead of purchasing that power from the grid (where it is generated by a CCGT), compared to the energy component of the transmission tariff.

Figure 3.11: Future Trends in the Economics of Self-Supply



Source: NERA analysis.

125. While we show above and in Appendix A that in current cost conditions, we estimate that our recommended tariff will not materially increase self-supply, the projection in Figure 3.11 shows that the economics of self-supply for industrial customers is also

[36] We focus on the energy charge of the transmission tariff because it is the component that increases in our recommended tariff relative to the current tariff.

set to worsen in the coming years due to the effects of carbon pricing. In other words, even though we estimate that our recommended change in the tariff will have a small effect on self-supply volumes, the incentives to self-supply are set to worsen materially in the coming years which means we expect an increase in energy charges will not cause significant reductions in the volume of energy supplied from the grid.

4. Summary

126. Some electricity industry participants (both in Alberta and globally) may have legitimate concerns about the risks of grid bypass and grid defection, especially in relation to transmission and distribution companies that already recover all (or the majority of) their costs from tariffs levied on energy consumption.

127. A proportionate response to these concerns is to adjust tariffs to ensure they have a cost structure that reflects the cost structure of the service in question as closely as possible, which we strive to do through our recommended tariff design.

128. Designing a tariff with the intention of minimising self-supply would be a disproportionate response. In fact, customers should be encouraged to self-supply when the costs they incur to do so are below the costs of supplying them from the grid. Self-supply decisions in response to cost reflective tariffs promote efficiency in the overall supply of electricity, and will tend to reduce the costs faced by the customers who purchase energy from the grid.

129. In the AESO's case, it is currently charging for the majority of its costs through a 12CP charge, the extent to which is not justified on grounds of cost causation as explained in the Stakeholder Session 5 presentation. The current tariff is therefore promoting *inefficient* self-supply decisions aiming to avoid 12CP charges. By contrast, our recommended tariff better reflects the dual purposes of transmission in Alberta: to meet peak demand and accommodate the flow of in-merit energy.

130. Therefore, customer response to the change in transmission tariff through different self-supply decisions will improve efficiency because the new transmission tariff is more cost reflective. However, even if a tariff is designed to reflect the cost structure of the transmission system, and therefore promote efficient decisions to use the grid or self-supply in the long-term, there remains a possibility that a tariff set to recover historical costs will cause customers to inefficiently self-supply in the short-term in cases where those customers make lower contributions to historical costs.

131. We therefore estimate customer response to our recommended tariff using a modelling procedure. We estimate that self-supply could increase under our recommended tariff by up to 2,801 GWh which is equivalent to a shift in costs from

self-supplying customers to other customers of approximately 1.90 per cent of the total revenue requirement for bulk and regional costs in 2019. Our estimate of customer response is a total effect that includes any dynamic responses by customers to self-supply decisions of other customers.

132. Our estimate of customer response ignores the potential for customers to increase purchasing of power from the grid during times of coincident peak in response to lower 12CP charges in our recommended tariff relative to the current tariff.

133. Hence, we predict an extremely limited increase in self-supply by industrial customers under our recommended tariff, and any change in customers' self-supply decisions that does arise will tend to result in more efficient patterns of electricity usage than under the current methodology.

Appendix A. Estimating Customer Response to Our Recommended Tariff

A.1. Overview of Our Approach

134. As we discuss in Section 3.4, our analysis of customers' decisions to self-supply using illustrative consumption profiles simplifies the self-supply decision. Customers' actual self-supply decisions depend on how and when they use electricity, which for most customers vary across hours of the year (and is rarely at a 100 per cent load factor as we assume for the customer in Panel B in Figure 3.2).

135. Customers consider different self-supply technologies, and different ways of optimally self-supplying using those technologies, depending on their consumption profile. For instance, as we discuss in Paragraph 27, customers can consider peaking generators for use during hours of the year when the costs of purchasing power from the grid are highest, or baseload generators for use during a larger number of hours of the year.

136. The choice of self-supply technology depends on the individual circumstances of the customer, and balances the fixed and variable costs of operating the self-supply technology with the avoided costs of purchasing power from the grid, which vary across hours of the year with the customers' consumption profile.

137. In order to better assess how customers may respond to our recommended transmission tariff, we model the optimal self-supply decisions for industrial sites in Alberta. Our approach is formed of three steps:

    A. ***Step 1:*** We construct a model that estimates the optimal self-supply decisions for industrial sites across Alberta, based on a simple comparison of the costs of purchasing power from the grid and self-generation costs. The model allows different customers (industrial sites) to use different self-supply technologies, and operate those technologies in different ways to optimise their decision to self-supply or purchase power from the grid. By performing this optimization for each customer, we estimate the optimal amount of self-supply across Alberta under the current and our recommended tariff.

B. ***Step 2:*** However, this optimisation model overstates the actual self-supply for customers because we do not model other costs associated with self-supply such as costs and risks associated with business complexity or financing. Consequently, actual self-supply by customers will be lower than the optimal self-supply identified by the model in Step 1, or "incentive to self-supply", that we model. To estimate how customers' actual self-supply decisions will be affected by a change in the transmission tariff, we estimate a regression equation to capture how likely customers are to self-supply, given the economic incentive to self-supply identified in Step 1. This regression also controls for customers' characteristics such as size, location, and industry.

C. ***Step 3:*** We then use our regression to predict customers' response to the change in incentive to self-supply under our recommended tariff.

138. In this Appendix, we detail our modelling approach and results from each of the above steps in more detail.

A.2. Step 1: Modelling the Optimal Self-Supply Decision for Customers

139. We examine the optimal self-supply decision for customers using site-level, hourly gross load data in 2018 and 2019.[37] Of the 564 sites for which we have load data, 133 are sites with only load from industrial customers. We use the 133 industrial-only sites in our analysis.

A. We assume that there is a single industrial customer at each industrial-only site that is responsible for the entire load at that site.[38]

B. Sites which are not industrial-only, are often constituted by a mixture of industrial, residential, commercial, or other customers. We are unable to use these sites as we cannot distinguish the profile of consumption belonging to industrial customers from residential customers.

[37] By gross load, we mean total consumption of power at the site, irrespective of whether that power is sourced from the grid or through self-supply. We use net load to refer to the site's purchase of power from the grid, in other words, its gross load less any self-supply it chooses to undertake. We rely on AESO site-level load data in our analysis.

[38] Our assumption likely leads us to overstate self-supply, assuming a single industrial customer at each site means self-supply may be more economic than if the site comprised multiple, smaller customers.

140. For each industrial customer (site), we calculate both the costs of purchasing power from the grid without self-supplying and the customers' optimal self-supply decision in 2018 and 2019. To perform these calculations, we use the procedure described below.

A.2.1. We group hours of the year to reduce the computational requirements of the model

141. In order to reduce the computational requirements of the model, we group similar hours of the year together using a Price Duration Curve approach. In total we define 53 groups of hours that are similar in terms of the costs that would be incurred to purchase power from the grid.

142. We define separate groups of hours for 2018 and 2019 based on the pool price in 2018 and 2019 respectively. More specifically:

A. The first 51 groups of hours are defined by percentiles of the distribution of hourly pool prices observed during the year in question.[39]

B. The 52nd group of hours is defined to capture rare incidences of scarcity pricing in the pool, where the pool price equals the price cap of $1000 per MWh. If we did not define the 52nd group of hours in this way, the average price of the 51st group of hours would be high as it would be influenced by these rare occurrences of scarcity pricing, which would distort our estimate of the self-supply decision in the hours in the 51st bucket.

C. The last group of hours is defined to contain 12CP hours only.[40] We separate 12CP hours to allow customers' self-supply decisions to change in 12CP hours in order to avoid the 12CP charge. Our model likely overstates customer response, because we assume that all customers can perfectly predict hours of 12CP.

143. Having grouped the hours of the year in this way, we calculate the average pool price and each customers' average gross demand in each group of hours. The average pool

[39] This corresponds to prices every 2nd percentile, with an additional price group to capture prices close to zero.

[40] Whilst in reality, 12CP is defined by a fifteen-minute interval, we are restricted by the data to look at hours of 12CP. We levy the 12CP charge on customer consumption during the hour of 12CP.

price and average demand during each group of hours defines a "representative hour" that applies to all hours within this group.

144. The tables below show the Price Duration Curves used by the model to characterise the costs of purchasing electricity from the wholesale market in 2018 and 2019.

Table A.1: Price Duration Curve (2018)

145. The Price Duration Curves above use historical hourly pool prices from 2018 and 2019.[41] They also use actual bulk and regional transmission charges in 2018 and 2019 to calculate transmission tariffs under the current tariff design.

146. We calculate transmission costs under our recommended tariff design using the approach described in the Stakeholder Session 5 presentation, using historical data on billing determinants, the total revenue requirement, and allocation factors calculated from hourly demand and generation data by area in each year.

147. We summarise the transmission charges that are used under our recommended tariff and the current tariff in 2018 and 2019 in Table A.3 below.

[41] Data provided by the AESO.

Table A.3: Bulk and Regional Transmission Charges Under Current and Our Recommended Tariff in 2018 and 2019

Current Tariff	2018	2019
12 CP ($ per MW-month)	10,177	10,524
BC ($ per MW-month)	2,281	2,359
Energy ($ per MWh)	2.04	2.13
Recommended Tariff	**2018**	**2019**
12 CP ($ per MW-month)	5,093	6,065
BC ($ per MW-month)	1,816	2,180
Energy ($ per MWh)	8.80	10.68

Note: Billing determinants sourced from AESO data. They may differ to those presented at the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5. Billing determinants are 96,044 (2018) and 97,698 (2019) MW-months for 12CP, 154,214 (2018) and 156,984 (2019) MW-months for billing capacity, and 61,000 (2018) and 59,678 (2019) GWh for energy consumption. Source: NERA Analysis.

A.2.2. We calculate how much each customer would pay if it did not self-supply

148. For each industrial customer, we calculate how much the customer would pay to purchase all of its gross demand from the grid under the current and recommended tariff in 2018 and 2019. We use the Price Duration Curves shown above and each customer's total gross demand (in MWh) within each group of hours.[42]

149. We summarise the costs of purchasing power from the grid across all customers under the current and recommended tariff in Figure A.1 below. The total cost that all industrial customers would have incurred to purchase their gross energy requirement from the grid would have increased slightly under our recommended tariff in 2019 relative to the current tariff, but decreased slightly in 2018.

A. The costs of purchasing power from the pool do not change between the two tariff scenarios, as we assume the pool price remains unchanged.

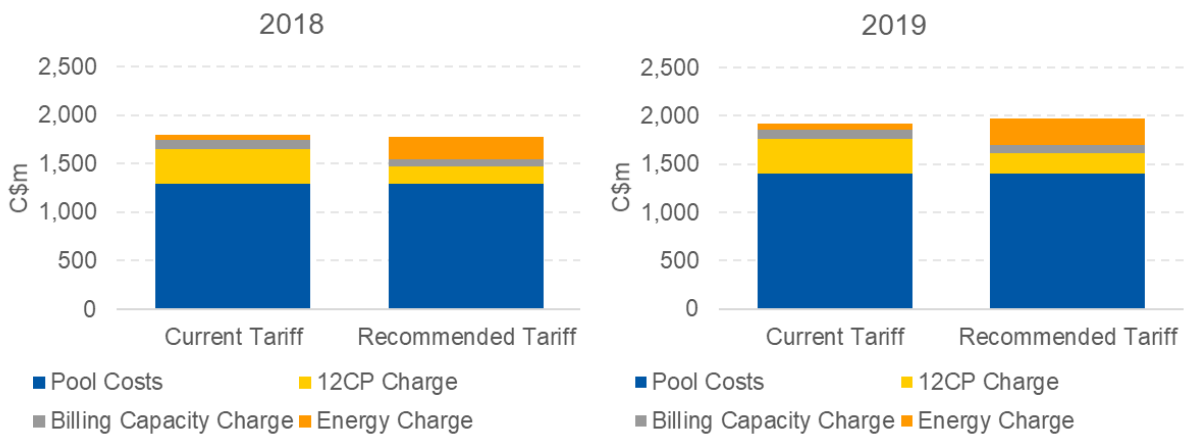
[42] Whilst our use of gross load data allows us to control for customers' existing self-supply decisions, we are unable to control for their load management decisions. In other words, a customer currently avoiding 12CP by reducing or eliminating its load during the 12CP hour, but without self-supplying, appears as if the customer has zero load in the hour. This means that we assume that the customer always chooses to avoid 12CP, if it is currently choosing to do so under the current tariff. Given our recommended tariff reduces the costs recovered by 12CP, our approach is likely to overstate the degree of 12CP avoidance under our recommended tariff.

B. The cost of 12CP charges falls under our recommended tariff, as the 12CP charge is lower under our recommended tariff design.

C. The cost of billing capacity charges falls under our recommended tariff. In our modelling, we assume customers' contract capacity is unchanged irrespective of its self-supply decision, as we assume the customer always relies on the grid for back-up.

D. The costs of paying the energy charge of the transmission tariff rise under our recommended tariff, as the energy charge is higher.

Figure A.1: Costs of Purchasing Power from the Grid Under the Current and Our Recommended Tariff



Note: POD costs not shown. Source: NERA analysis of AESO data.

A.2.3. We perform modelling to optimise the self-supply decision for each customer

150. We then perform optimisation modelling to identify the self-supply decision for each customer that would minimise its energy costs.

151. The model allows customers to choose to self-supply from two different technologies, or types of plant that we discuss in Appendix A.2.4 below. We do not constrain the capacity of plants that customers can build to be above a particular size, or the mix of the two alternative technologies. Hence, customers can build any amount (in MW terms) of either or both types of plant. This conservative assumption makes the costs of self-supply appear more attractive than they would be in reality, as generation units

typically come in standardised sizes, so each unit installed cannot be below a certain size.

152. Our model assumes that, if customers invest in plant, they incur capital costs and fixed O&M costs irrespective of how they subsequently use the plant. Having built a plant, the model optimises when the plant should be dispatched for self-supply, up to the capacity of the plant. When a customer self-supplies power from its plant:

A. It incurs variable O&M costs, fuels costs (natural gas costs), and carbon costs.[43]

B. It avoids serving its gross load from the pool, which would incur costs as per the Price Duration Curves shown above.

153. The model assumes that each customer chooses how many MW of each generation technology to build and the hours in which to run it, to minimise its total costs of meeting its gross load. The total cost function, which the model minimises using a "linear program" approach, constitutes the costs of purchasing power from the grid (pool price plus transmission costs) and the costs associated with self-supplying through investing in and running on-site plant.

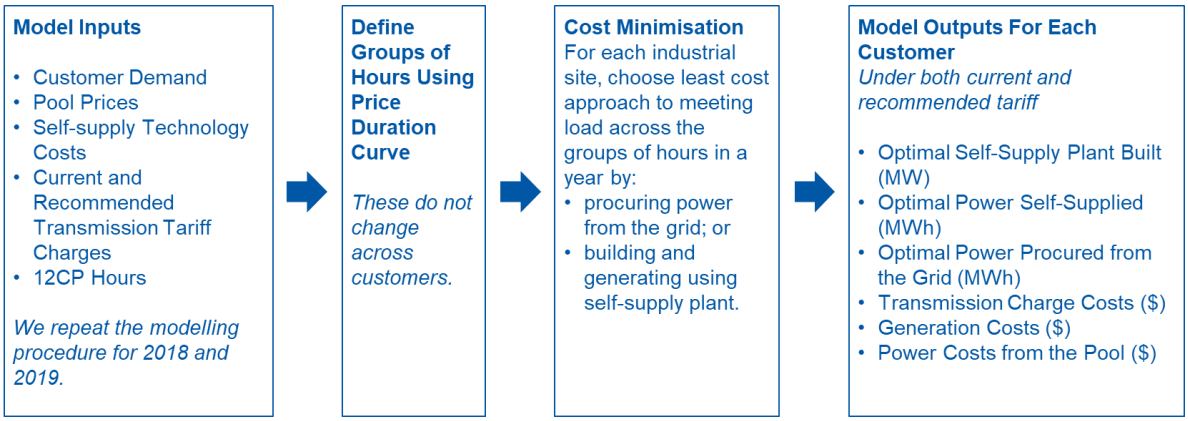
154. The model chooses how much capacity of each type of plant to build, and how much power to self-supply from each plant in each representative hour. It cannot produce more than the capacity of its plant in each representative hour, and the model is constrained to either use self-supply or power from the grid to meet the customer's gross load.[44]

155. We solve this linear programming problem for each customer (industrial site), under the current and recommended tariff, and separately for both 2018 and 2019. The solution of the problem for each customer defines its optimal self-supply under each tariff and in each year. We illustrate our modelling approach in Figure A.2 below.

[43] Throughout our analysis we source gas costs and forecasts from the Alberta Energy Regulators Forecast of AECO-C gas prices updated June 2020 and accessed here: https://www.aer.ca/providing-information/data-and-reports/statistical-reports/st98/prices-and-capital-expenditure/natural-gas-prices/aeco-c-price. Last Accessed 12 May 2021.

[44] We assume that customers cannot use self-supply technology to export power to the grid.

Figure A.2: Illustration of Our Modelling Approach



Source: NERA illustration.

A.2.4. Assumed self-supply technologies

156. We allow the model to choose between two technologies for self-supply:

A. An aeroderivative combustion engine ("ACE") fuelled by natural gas. The costs and assumptions of the ACE are derived from an AESO-commissioned study on the Cost of New Entry Analysis: Combustion Turbines and Combined-Cycle Plants.[45]

B. A reciprocating internal combustion engine ("RICE") fuelled by natural gas. The RICE costs and assumptions are derived from the AESO Delivered Cost of Energy Report.

157. We summarise our assumptions and sources for costs and operating conditions of each technology, the ACE and RICE, in Table A.4 and Table A.5 below respectively.

Table A.5: RICE Plant Cost Assumptions and Sources (2019 C$)

	Units	**RICE**	**Assumption/Source**
Initial Capex	*$/kW*	2,200	AESO Delivered Cost of Electricity Report 2020.
Heat Rate	*GJ/MWh*	10.50	AESO Delivered Cost of Electricity Report 2020.
Variable O&M	*$/MWh*	9.77	AESO Delivered Cost of Electricity Report 2020.
Fixed O&M	*$/kW-year*	0.00	AESO Delivered Cost of Electricity Report 2020. No fixed O&M costs mentioned in report so assumed to be zero. The risk with our assumption is that we understate the costs of self-supply technologies.
Lifetime	*years*	25	NERA assumption based on lifetime of plants cited in other sources. The AESO cites a 25-year asset life for a simple cycle gas plant in its Summary of Integrated Capacity and Energy Revenue Modelling, but a 20-year asset life for the ACE in the Cost of New Entry Analysis. In order to ensure we do not overstate the costs of self-supply, we assume a 25-year asset life.
Build time	*years*	2	Based on an internal combustion engine as cited by the EIA.
Emissions Intensity	*t/MWh*	0.53	NERA Calculation using (i) tCO2/therm = 0.0053[49] (ii) Btu/therm = 100,000;[50] therm/GJ = 0.105506.[51]
Rate of return	*%*	8.20%	NERA assumption based on rate of return cited by AESO for a simple cycle gas turbine in its Summary of Integrated Capacity and Energy Revenue Modelling.

Source: NERA Analysis of AESO (31 May 2020), Delivered Cost of Electricity Report; and Energy Information Administration (February 2021), Assumptions to the Annual Energy Outlook 2021: Electricity Market Module.

158. As can be seen in the above tables, the ACE and RICE have different cost profiles. The ACE has higher fixed costs each year than the RICE. However, the ACE has lower variable costs of generation than the RICE. We summarise the fixed and variable costs of each technology in Table A.6 below.

[49] EIA, Greenhouse Gases Equivalencies Calculator - Calculations and References, Last Accessed 17 May 2021, Link: https://www.epa.gov/energy/greenhouse-gases-equivalencies-calculator-calculations-and-references.

[50] EIA, FAQs, Last Accessed 17 May 2021, Link: https://www.eia.gov/tools/faqs/faq.php?id=45&t=8

[51] EIA, Energy Conversion Calculators – Natural Gas, Last Accessed 17 May 2021, Link: https://www.eia.gov/energyexplained/units-and-calculators/energy-conversion-calculators.php

Table A.6: ACE and RICE Variable and Fixed Costs (2019 C$)

	ACE	RICE
Fixed Cost ($/kW/yr)	228	210
Variable Cost ($/MWh)	23.35	31.29

Source: NERA Analysis

159. Therefore, the ACE is a self-supply option similar to the baseload generation option that we outline in Paragraph 27 above. Whilst it is more expensive to build, it is more economically viable than RICE technology when run for more hours of the year, due to its lower variable costs. On the other hand, the RICE is similar to the peaking generation option that we outline in Paragraph 27 above. Whilst it is cheaper to build, it is only more economic than the ACE in fewer hours, due to its higher variable costs.

160. We considered a range of potential self-supply technologies in our analysis, drawing on both AESO studies as well as studies from the US Energy Information Administration ("EIA"). We summarise the characteristics of some of the alternative options we considered in Table A.7 below.

A. A key component of our assumption of available self-supply technologies is the size of the plant. For instance, whilst grid-scale CCGTs are more efficient than our chosen technologies, in practice, most industrial customers are unable to install a CCGT to self-supply because the minimum size of the plant is too large relative to an industrial customers' typical load.[52]

B. Therefore, we focus our analysis on plants with smaller minimum sizes for use in self-supply. In our optimization of the customers' self-supply decision, we do not constrain the minimum size of plant that the customer can build, and therefore our choice of self-supply technology should be appropriate for small-scale plant. Hence, we do not consider CCGT, Frame Combustion Turbine ("Frame CT"), and Simple Cycle Gas Turbine ("SCGT") technologies. Whilst the SCGT plant is similar in size to the ACE plant that we adopt, we consider the ACE plant to be

[52] For similar reasons, we assume that industrial customers cannot utilise intermittent technologies (combined with battery storage) because these technologies require significant land and therefore cannot be used to materially offset load. The AESO states, for industrial and large commercial customers, that "area available for PV arrays is likely insufficient to offset load" in its discussion of self-supply technologies in its Delivered Cost of Electricity Report. Source: AESO (May 2020), Delivered Cost of Electricity Report, p. 28.

more representative of the costs of installing self-supply technology, as the fixed cost estimate also includes other costs that merchant generators would incur in Alberta e.g. including an indicative cost of land.[53]

C. We considered using plant assumptions as detailed by the EIA in its Assumptions to the Annual Energy Outlook 2021.[54] More specifically, we considered utilising a distributed generation baseload gas plant ("DG Base"), and a distributed generation peaking gas plant ("DG Peak"). Both of these plants have small sizes of 2 MW and 1 MW respectively, and are therefore suitable for self-supply. The EIA also provides data for an Internal Combustion Engine ("ICE") which has a size of 21 MW which is likely more appropriate for self-supply options compared to the ACE which has a size of 93 MW.

D. However, these plants are not cost competitive compared to the ACE and RICE plants. To illustrate this, we calculate a screening curve for the remaining self-supply technologies. The screening curve illustrates, for each technology, the total costs of building a 1 kW plant and then operating that plant for various hours of the year, generating 1 kWh per hour that it operates. We illustrate our screening curve in Figure A.3 below. It shows that either ACE or RICE technologies are the least cost technologies, across any amount of running hours.

A.2.5. Additional model assumptions

161. We also make assumptions relating to inflation, exchange rates, gas costs, and carbon costs. We detail these assumptions and our sources in Table A.8 below.

Table A.8: Overview of Model Assumptions

Assumption	Units	2018	2019	2020	Source
Exchange Rate	US$ to C$	1.2957	1.3269	1.3415	Bank of Canada, Annual Average Exchange Rates, Link: https://www.bankofcanada.ca/rates/exchange/annual-average-exchange-rates/, Last Accessed 05/05/2021.
Inflation Rate	%	1.40%	2.40%	1.84%	Inflation calculated as YoY percentage change in CPI from January each year. Source: Bank of Canada, Consumer Price Inflation, Link: https://www.bankofcanada.ca/rates/price-indexes/cpi/, Last Accessed 05/05/2021.

A.2.6. Estimating optimal self-supply for customers

162. We run the model to estimate each customer's optimal self-supply decision using data for both 2018 and 2019 under both the current and recommended tariff designs. Our optimization model chooses the least cost combination of self-supply and purchasing of power from the grid across the year for each customer to meet its load.

163. In Table A.9 below, we outline the optimal investment in ACE and RICE plant resulting from our model of optimal self-supply decisions across customers under the current and recommended tariff. We find that most customers in our model build ACE plant, which has higher fixed costs than the RICE plant but lower variable costs. Under the recommended tariff, customers invest in more ACE plant but less RICE plant, suggesting that customers find it optimal to self-supply in more hours of the year due to the higher energy charge, thereby opting for the baseload instead of peaking technology.

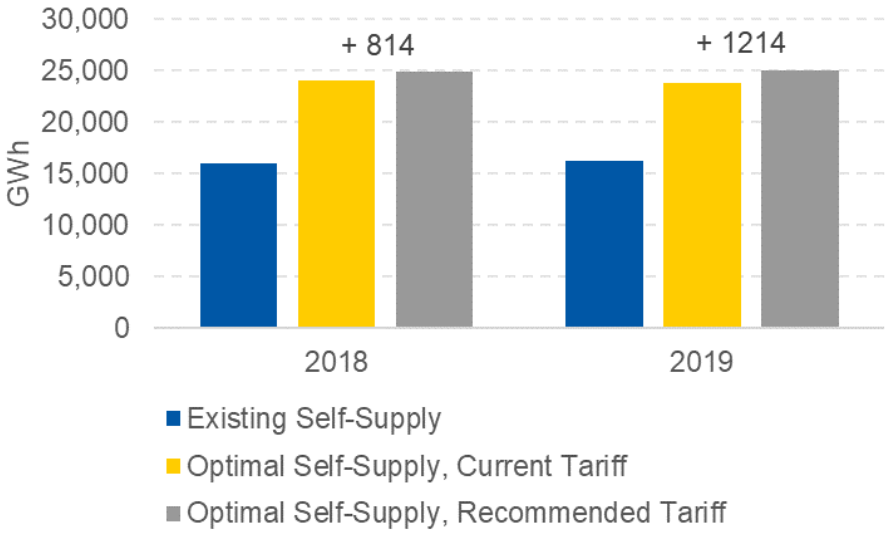
Table A.9: Modelled Optimal Self-Supply Plant Under Current and Recommended Tariff in 2018

	Capacity (MW)	ACE Capacity	RICE Capacity
Current Tariff	2,872	2,850	22
Recommended Tariff	2,893	2,887	6
Difference	21	37	-16

Source: NERA Analysis.

164. We illustrate the total change in energy self-supplied under the current and recommended tariff in Figure A.4 below. Our model suggests that optimal self-supply under the current tariff (yellow bars) is slightly lower than under our recommended tariff (grey bars). We find that moving from the current to the recommended tariff marginally increases optimal self-supply for customers in our sample by 814 GWh and 1,214 GWh in 2018 and 2019 respectively.

Figure A.4: Modelled Optimal Self-Supply Under Current and Recommended Tariff in 2018 and 2019



Source: NERA Analysis.

165. However, as can be seen in the figure, our model suggests much higher optimal self-supply under the current tariff (the yellow bars) than actually observed self-supply in 2018 and 2019 (the blue bars). Our model suggests optimal self-supply is approximately 50 and 47 per cent greater under the current tariff than actual self-

supply under the current tariff. This finding is similar to the AESO's finding in the Delivered Cost of Electricity Report, as we discuss in Section 3.4.2 above.

166. We would expect to observe this result for two key reasons:

A. Our model understates the cost of self-supply technologies. As we discuss in Appendix A.2.3, our model allows customers to build increments of capacity of self-supply technologies as we do not restrict the customer to a minimum size of plant. We also choose technologies available for self-supply that are more cost competitive than smaller plants appropriate for distributed generation but with higher operating costs.

B. Our model only considers the costs of self-supply associated with the fixed and variable costs of operating self-supply generators. In reality, customers incur other costs in their decision to self-supply, such as the costs and risks associated with business complexity and financing. Other industrial customers may not be able to self-supply due to their location in the province or lack of available land. We cannot directly observe these other costs associated with self-supply in the data available.

167. Therefore, to account for the additional costs associated with self-supply, we examine how customers' actual decisions to self-supply are linked to the incentive to self-supply identified by our optimisation modelling, as explained below.

A.3. Step 2: Estimating the Actual Self-Supply Response by Customers

168. We estimate a statistical relationship between actual self-supply decisions and the incentive to self-supply (as measured by the optimal self-supply generation amount predicted by our model in Step 1).[58]

169. We use an Ordinary Least Squares regression procedure to estimate the statistical relationship between actual self-supply and the incentive to self-supply across customers. In our regression, our dependent variable (the variable we are explaining)

[58] We could have utilized data for both 2018 and 2019 to estimate the statistical relationship. However, we only use data in 2018 so that we can test the performance of our model in predicting actual self-supply in 2019, as we discuss in Appendix A.3.2 below.

is total actual self-supply by customer across 2018 (in MWh), defined by the difference between each customer's metered gross demand and its metered net demand.

170. We use the total optimal self-supply by customer across 2018 (in MWh), taken from our model as our measure of the *incentive* to self-supply as an explanatory variable (the variable we are using to predict actual self-supply) in the regression. We illustrate our approach in Figure A.5.

Figure A.5: Illustration of Our Regression Approach

$$\text{Actual Self-Supply} = \alpha + \beta * (\text{Incentive to Self-Supply}) + \varepsilon$$

Where:

$$\text{Incentive to Self-Supply} = \text{Modelled Optimal Self-Supply}$$

α and β, are constants to be estimated, ε is an error term.

Source: NERA illustration.

171. Put simply, this procedure allows us to predict how much a customer would typically self-supply, as a function of how much an optimisation model suggests the customer should self-supply if it were making a least-cost trade-off between self-generation costs and purchasing power from the grid, as shown above.

A.3.1. We include a number of explanatory variables in our regression

172. We include a number of other explanatory variables that allow different customers to respond to the incentive to self-supply in different ways, depending on their characteristics. Formally, we use "interaction terms" in our regression which allow the statistical relationship between actual self-supply and the incentive to self-supply to change depending on customer characteristics. We include the following customer characteristics in our regression:

A. Contract Capacity: We allow the response of customers to the incentive to self-supply to change with contract capacity. As discussed in Appendix A.2, we assume each site contains a single industrial customer.

B. Industry Type: Customers' response to the incentive to self-supply might change depending on its industrial processes. We allow the response of customers to change with each customer's industry type. More specifically, we estimate different customer responses for the wood industry (pulp and paper or wood production), oilsands industry, pipeline industry, or other industry (chemical, steel, cement). We estimate a different customer response for customers with no listed industry.

C. Location in a City: We allow the response of customers to change if the customer is located in the Calgary or Edmonton planning region. Customers in more densely populated areas may have less land available for self-supply technology, reducing their responsiveness to the incentive to self-supply.

D. Industry System Designation ("ISD"): We allow the response of customers to change if the customer already has ISD status. We would expect customers with ISD status to be more responsive to the incentive to self-supply.

173. Formally, our regression is written in Table A.10 below.

Table A.10: Our Regression Approach

Type of Variable	Variable
Dependent Variable	Actual Self-Supply (MWh)
Constant	Constant
Explanatory Variable 1	Incentive to Self-Supply (MWh)
Explanatory Variable 2	Incentive to Self-Supply (MWh) x Contract Capacity (MW)
Explanatory Variable 3a	Incentive to Self-Supply (MWh) x Wood Industry (1/0 Dummy)
Explanatory Variable 3b	Incentive to Self-Supply (MWh) x Oilsands Industry (1/0 Dummy)
Explanatory Variable 3c	Incentive to Self-Supply (MWh) x Pipeline Industry (1/0 Dummy)
Explanatory Variable 3d	Incentive to Self-Supply (MWh) x Other Industry (1/0 Dummy)
Explanatory Variable 4	Incentive to Self-Supply (MWh) x Located in City (1/0 Dummy)
Explanatory Variable 5	Incentive to Self-Supply (MWh) x ISD (1/0 Dummy)
Residual	Residual Term

Note: A dummy variable takes the value of 1 if true for a customer or 0 otherwise. For instance, if a customer has an ISD then the dummy variable will equal 1, otherwise it will equal 0. Source: NERA Analysis.

A.3.2. We estimate our regression and analyse its predicative power using 2019 data

174. We estimate our regression using 2018 data and present our results in Table A.11.

Table A.11: Our Estimated Regression Using 2018 Data

Dependant Variable: MWh of Actual Self-Supply	Coefficient	p-Value
Incentive to Self-Supply *(MWh of Optimal Self-Supply as Estimated by Model)*	0.174	0.106
Interaction with ISD	0.485	0.000
Interaction with Contract Capacity	-0.001	0.000
Interaction with City	-0.301	0.185
R-Squared	0.9696	
Number of Observations	133	

Notes: Interactions with Industry Types Not Shown but Included in Model. All industry interaction explanatory variables are statistically significant with the exception of "pipeline". Incentive to self-supply is statistically significant when tested across all interaction terms. Source: NERA Analysis.

175. Our estimated regression suggests that as the incentive to self-supply increases, as measured by a 1 MWh increase in the optimal amount of self-supply identified by our model, actual self-supply by customers increases. We estimate how this relationship is affected by the characteristics of the customer:

    A. A customer with an ISD is found to be more responsive to the incentive to self-supply, increasing its actual self-supply by 0.485 MWh more than a customer without an ISD in response to a 1 MWh increase in the amount of self-supply that the optimisation model in Step 1 suggests is least cost.

    B. A customer located in the Edmonton or Calgary planning regions is found to be less responsive to the incentive to self-supply, increasing its actual self-supply by 0.301 MWh less than a customer outside these regions in response to a 1 MWh increase in the amount of self-supply that the optimisation model in Step 1 suggests is least cost.

    C. Contract capacity has a statistically significant and negative impact on the customer response to the incentive to self-supply. However, the size of this impact is very small.

176. Our regression also has a high degree of statistical fit, meaning that it explains the majority of the variation in actual self-supply across customers. Formally, the R-squared of our regression is 0.9696, meaning our regression explains 96.96 per cent of the variation in actual self-supply across customers in 2018 using the explanatory

variables. This is reassuring as it means our model has a strong predicative power to estimate actual self-supply from the amount of self-supply that the optimisation model in Step 1 suggests is least cost.

177. To further assess the predicative power of our regression, we use it to predict self-supply in 2018 and 2019 across industrial customers. We would expect our regression to perform well at predicting 2018 actual self-supply, because we estimate the regression using 2018 data. However, in this calculation we are particularly interested in the performance of our regression at predicting 2019 self-supply decisions, because this data is not used to calibrate the regression equation. We detail our results for our sample of customers in Table A.12 below.

Table A.12: Analysis of the Predicative Power of Our Regression

	2018	**2019**
Modelled Incentive to Self-Supply (GWh)	24,114	23,851
Actual Self-Supply (GWh)	16,055	16,245
Predicted Self-Supply Using Regression (GWh)	**16,624**	**16,534**
Difference Between Predicted and Actual Self-Supply (GWh)	570	289
Prediction Error Relative to Actual Self-Supply (%)	**3.55%**	**1.78%**

Source: NERA Analysis of AESO Data

178. Our regression performs well in predicting actual self-supply by customers in 2019. It predicts a volume of self-supply in 2019 within 2 per cent of the actual self-supply volume observed in that year. Therefore, we are reassured that our regression performs well at predicting actual self-supply based on data that is "out of sample", i.e. data that is not used to initially estimate the regression such as 2019 data.

179. Consequently, we are content that our regression predicts accurately the actual self-supply response by customers.

A.3.3. We considered alternative specifications of our regression

180. We considered an alternative specification of our regression which uses the cost savings associated with optimal self-supply relative to purchasing all power from the grid as a measure of the incentive to self-supply (rather than the MWh of optimal self-supply as in the "MWh Regression" above).

181. Similar to our "MWh Regression" our "Cost Regression" uses the same interaction terms to allow customers' responsiveness to the incentive to self-supply, as measured by our modelled costs savings associated with self-supply, to differ with their characteristics.

182. We estimate our "Cost Regression" using 2018 data and present our results in Table A.13.

Table A.13: Our Estimated "Cost Regression" Using 2018 Data

Dependant Variable: MWh of Actual Self-Supply	**Coefficient**	**p-Value**
Incentive to Self-Supply *(Cost Savings of Optimal Self-Supply as Estimated by Model)*	0.0093	0.103
Interaction with ISD	0.0254	0.000
Interaction with Contract Capacity	-0.0001	0.000
Interaction with City	-0.0172	0.169
R-Squared	0.9697	
Number of Observations	133	

Notes: Interactions with Industry Types Not Shown but Included in Model. All industry interactions explanatory variables are statistically significant with the exception of "pipeline". Incentive to self-supply is statistically significant when tested across all interaction terms. Source: NERA Analysis.

183. Our estimated "Cost Regression" suggests that as the incentive to self-supply increases, as measured by the cost savings associated with optimal self-supply relative to purchasing power from the grid in our model, actual self-supply by customers increases. We estimate that this relationship is also affected by the characteristics of the customer in a similar way to the "MWh Regression" as detailed in Table A.11 above.

184. Our "Cost Regression" also has a high degree of statistical fit, meaning that it explains the majority of the variation in actual self-supply across customers. The R-squared of our regression is 0.9697, meaning our regression explains 96.97 per cent of the variation in actual self-supply across customers in 2018 using the explanatory variables we include in it.

185. Similar to our test for the "MWh Regression", we further assess the predictive power of the "Cost Regression" by predicting self-supply in 2018 and 2019 across industrial

customers using our regression. We detail our results for our sample of customers in Table A.14 below.

Table A.14: Analysis of the Predicative Power of Our Regression

	2018	**2019**
Modelled Incentive to Self-Supply (GWh)	24,114	23,851
Actual Self-Supply (GWh)	16,055	16,245
Predicted Self-Supply Using Regression (GWh)	**16,605**	**19,561**
Difference Between Predicted and Actual Self-Supply (GWh)	550	3,316
Prediction Error Relative to Actual Self-Supply (%)	**3.43%**	**20.41%**

Source: NERA Analysis of AESO Data

186. Our "Cost Regression" performs better than our "MWh Regression" at predicting self-supply by customers in 2018.

187. However, our "Cost Regression" performs less well at predicting 2019 self-supply than our "MWh Regression", resulting in it predicting self-supply that is approximately 20 per cent higher than actually observed under the current tariff. We therefore use our "MWh Regression" to predict the actual self-supply response by customers to our recommended tariff in Appendix A.4 below.[59]

A.4. Step 3: Our Estimate of Self-Supply by Customers

A.4.1. Estimating the change in self-supply volumes due to the change in tariff design

188. Using our preferred specification, the "MWh Regression", we predict how self-supply by industrial customers would change under our recommended tariff design using data for 2018 and 2019. We report our results in Table A.15 below. We calculate two changes in self-supply:

A. We calculate the difference between predicted self-supply under our recommended tariff and predicted self-supply under the current tariff, where both are predicted using our modelling and regression procedure described above.

[59] We also considered logarithmic regressions to estimate the percentage increase in actual self-supply in response to a percentage increase in the incentive to self-supply. However, we could only estimate the logarithmic model on customers who are currently self-supplying (to prevent introducing non-linearity to the data) and these customers may be systematically different to the customers not self-supplying, leading to systematic bias in our estimate of self-supply.

This is shown in Row C of the table below. This calculation shows the change in self-supply predicted by our modelling procedure due to the change in the tariff design.

B. We calculate the difference between predicted self-supply under our recommended tariff and *actual* self-supply, as observed under the current tariff. This is shown in Row E of the table below. In other words, this calculation compares our modelled projection of self-supply after the change in the tariff design to the actual volume of self-supply today, i.e. under the current methodology.

Table A.15: Our Estimate of Customer Self-Supply in 2018 and 2019 Under Our Recommended Tariff

	Units: GWh	**2018**	**2019**
A	Predicted Self-Supply Under Recommended Tariff	17,249	17,401
B	Predicted Self-Supply Under Current Tariff	16,624	16,534
C = A – B	**Change in Self-Supply Under Recommended Tariff Relative to *Predicted* Self-Supply Under Current Tariff**	**625**	**867**
D	Actual Self-Supply Under Current Tariff	16,055	16,245
E = A – D	**Change in Self-Supply Under Recommended Tariff Relative to *Actual* Self-Supply Under Current Tariff**	**1,194**	**1,156**

Source: NERA Analysis.

189. We therefore predict an increase in self-supply across customers in our sample of between 625 and 1,194 GWh, depending on the approach used.

190. As we discuss in Appendix A.3.2, our regression overstates self-supply when compared against actual self-supply under the current tariff. Therefore, we control for this tendency by comparing our estimate of self-supply under the recommended tariff with *predicted* self-supply under the current tariff using our modelling procedure (Row C), rather than compare it to *actual* self-supply under the current tariff. If we do this, our model predicts an increase in self-supply across customers in our sample of 625 to 867 GWh.

191. We only model the optimal self-supply decision for industrial-only sites. Other industrial customers are located on shared sites with residential and other customers.

Therefore, to ensure we do not understate the incentive to self-supply, we scale our results to account for the industrial customers located on sites outside of our sample. More specifically, we calculate the scaling factor by examining the proportion of total industrial contract capacity constituted by our sample, and scaling by the result, as we show in Table A.16 below.

Table A.16: Calculation of the Scaling Factor for Our Modelling

A	Industrial-Only Site Contract Capacity	3,470 MW
B	Total Industrial Contract Capacity	7,186 MW
C = B / A	Scaling Factor	2.071

Source: NERA Analysis of AESO Data.

192. Scaling our results using this factor, **we estimate that self-supply will increase under our recommended tariff by 1,294 to 2,473 GWh relative to the current tariff** (not controlling for our model's tendency to overstate self-supply). This is equivalent to 2.17 to 4.14 per cent of the total metered energy billing determinant, used to calculate the transmission energy charge, in 2019.

193. Therefore, we estimate that customer response to our recommended tariff will be extremely limited.

A.4.2. We also considered whether a further customer response might arise from lower energy demand increasing the tariff

194. As customers choose to self-supply, the total metered energy billing determinant reduces. The AESO's revenue requirement does not change in the short run due to changes in demand,[60] so if customers choose to self-supply, the AESO needs to recover the same revenue requirement from a smaller billing determinant, resulting in a higher energy charge.[61] Therefore, whilst we estimate above an initial or "direct" self-supply response of between 1,294 to 2,473 GWh, we also need to account for any

[60] In the long run, as we discuss in Section 3.1.2, changes in self-supply decisions will result in changes in the AESO's costs.

[61] In practice, our recommended tariff methodology will adjust the division of costs with the changing use of the grid, as we estimate classification and allocation factors based on area level data. Therefore, decisions to self-supply will impact the classification of costs to energy. For simplicity, we maintain the same classification of costs for the purposes of this exercise.

In addition, reductions in energy consumption will also reduce the pool price and therefore the costs associated with purchasing electricity from the grid. Again for simplicity, we do not account for this factor in our analysis leading us to potentially overstate the self-supply response.

further self-supply response resulting from the direct self-supply response increasing the transmission tariff to the remaining customers.

195. We therefore recalculate our recommended tariff, with the energy charge recalculated using total metered energy *less* the direct self-supply response.[62] We use our highest estimate of the self-supply response (2,473 GWh) to recalculate the tariff. Our recalculated tariff has a higher energy charge but the same 12CP and billing capacity charge. We then estimate the change in self-supply using the same modelling procedure described above.

196. Having completed this procedure to estimate the "secondary" impact, we repeat the procedure a third time. We summarise our calculations and results in Table A.17 and Figure A.6 below.

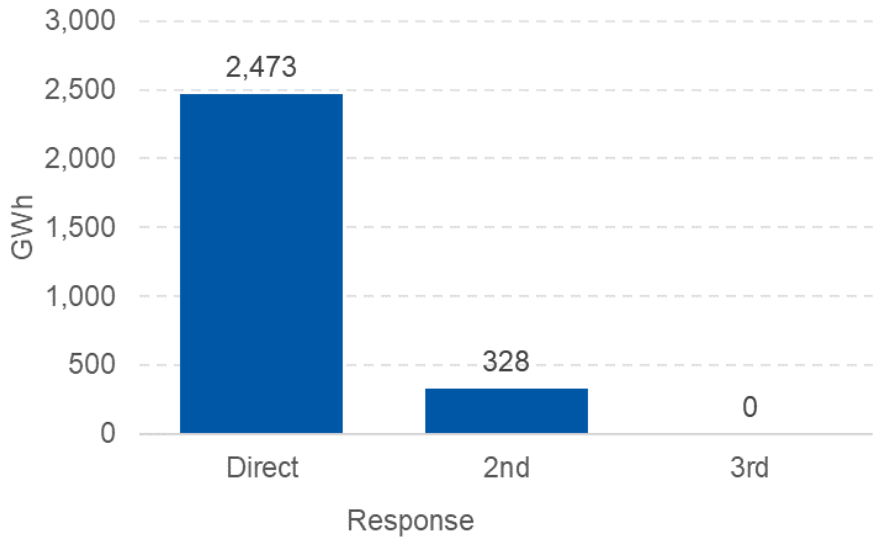
Table A.17: Our Estimate of the Dynamic Self-Supply Response to Our Recommended Tariff

	Direct	2nd	3rd
Costs Recovered from Energy Charge (C$m)	638	638	638
Energy Billing Determinant (GWh)	59,678	57,205	56,877
Energy Charge ($ per MWh)	10.68	11.14	11.21
Estimated Self-Supply Under Recommended Tariff (GWh)	**17,249**	**17,407**	**17,407**
Estimated Self-Supply Under Current Tariff (GWh)	16,055		
Additional Self-Supply Response (After Scaling, GWh)	**2,473**	**328**	**0**

*Note: * Numbers from 2018 as we take our maximum estimate of self-supply as our direct response to the tariff. Remaining numbers estimated using 2019 data. Source: NERA Analysis*

62 We use 2019 data in this modelling exercise.

Figure A.6: Our Estimate of the Dynamic Self-Supply Response to Our Recommended Tariff



Source: NERA Analysis.

197. These results show that any further increase in self-supply would be extremely limited. Even taking the top end of our estimated range, we estimate the total self-supply response will total 2,801 GWh. This is equivalent to 4.69 per cent of the total metered energy billing determinant, used to calculate the transmission energy charge, in 2019. It is also equivalent to a total cost shift of C$ 29.92 million (in real 2019 terms) from self-supply customers to other customers, which is approximately 4.69 per cent of total costs allocated to the flow of in-merit energy in 2019 and 1.90 per cent of the total revenue requirement for bulk and regional costs in 2019.

Demand Opportunity Service (DOS) Bid Examples

Purpose

The purpose of this document is to build on the DOS modernization recommendation explanation of DOS load bidding in the energy market, provided during the Bulk and Regional Tariff Design Stakeholder Engagement Session 5B (DOS) hosted by the AESO on May 20, 2021. The examples are intended to provide an overview of how DOS load could bid in a simple manner, recognizing that more sophisticated bidding strategies could be developed.

The information contained in this document is provided to stakeholders in the Bulk and Regional Tariff Design engagement for information purposes only and to further stakeholder understanding of the information presented at Session 5B (DOS) on May 20, 2021. The information in this document is not intended to be used or relied upon for any other purpose.

Bid submission and dispatch

Loads, using a dispatchable sink asset provided by the AESO, are able to bid into the energy market as a means of having their consumption dispatched in line with the price levels submitted through their bids. Bids are submitted with volume and price pairs like offers, where the bid indicates the volume of energy the sink will consume when price is below the bid price, and correspondingly indicating how much load will reduce should price exceed the bid price. Unlike offers, bids will not be paid for their response. Bid submission operates at the inverse to energy market offers.

Like energy market offers from a source asset, a participant may bid up to seven blocks of energy from a sink asset. Those seven blocks are then assigned to a dispatchable sink asset. For energy market offers, block zero is always the lowest priced block submitted. For bids, block zero is always the highest priced block submitted. Subsequent bid blocks are at least one cent lower in price than the previous block.

Bid blocks are “dispatched on”, meaning load is dispatched to consume, when the block price is above the system marginal price (SMP). Bid blocks are “dispatched off”, meaning load is dispatched to reduce, when the block price is at or below the SMP. When a bid block is “dispatched on” it means the energy in that block can be consumed as price has not yet reached the bid price, and the overall load should increase by the block size. When a bid block is “dispatched off” it means the energy in that block is to no longer be consumed as the price is above the bid price and the load should decrease by the size of the dispatched block.

Figure 1 below provides two different examples of bids for a 30 MW sink asset. The “in-merit” bid indicates the participant wants to be dispatched in much the same fashion as a “price-taker” offer by placing all the block MW at the energy market price cap. The “out-of-merit” bid indicates the participant does not want to be dispatched to consume by placing the bid block MW at the price floor.

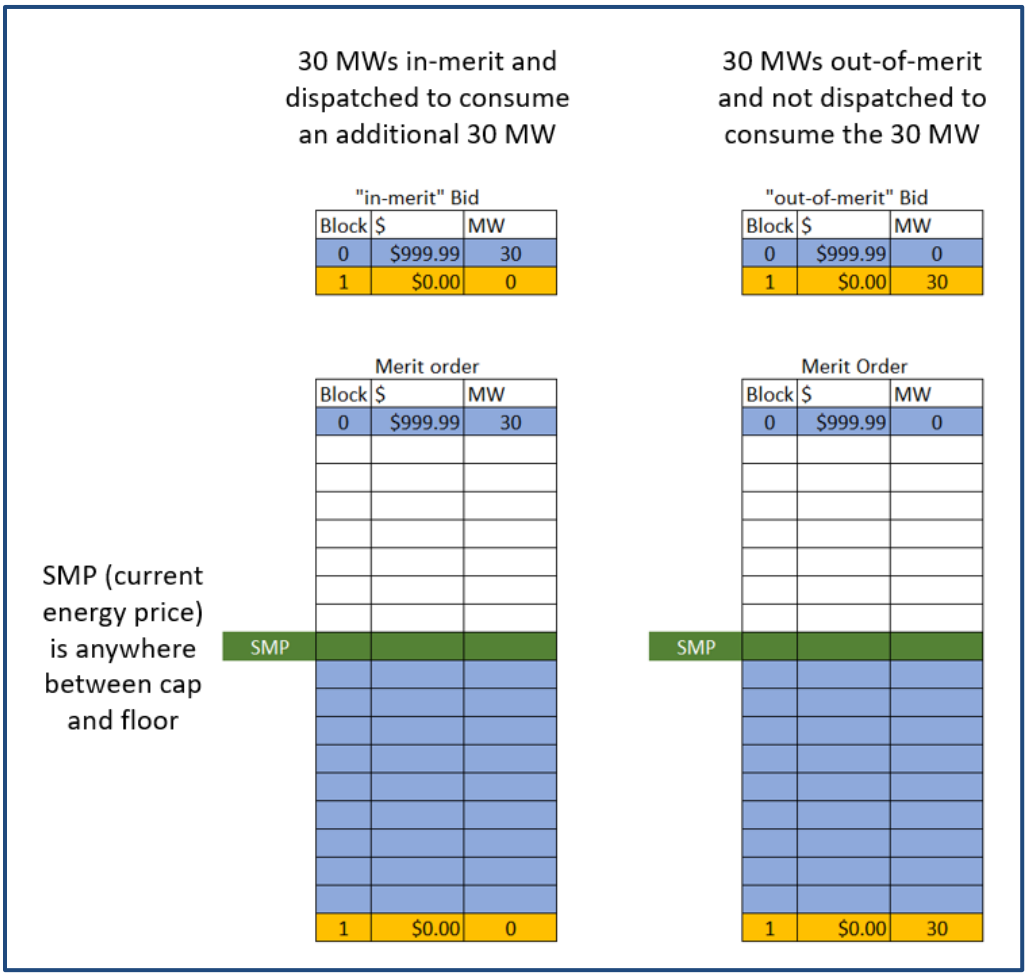
Figure 1: Bid prices and dispatch

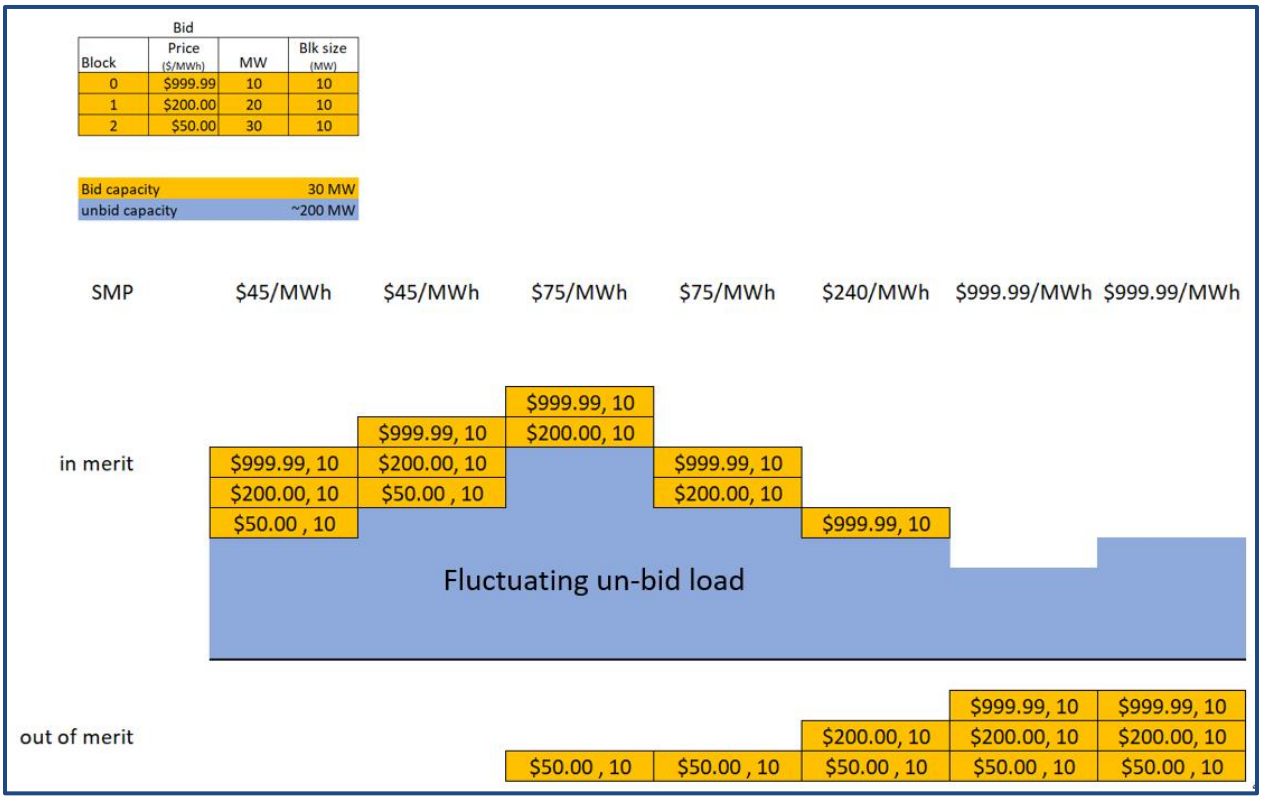


The “must offer” requirement that applies for energy market offers, which requires all available capacity to be offered into the market does not directly apply for energy market bids. For sink assets in the energy market, bids may be submitted for all or part of the load attributed to the participant. Because of this bid feature the concept of “must bid the entire load” does not apply like “must offer” does for generators. However, the requirement to comply (i.e., “must comply to the dispatch instruction”) applies to both bids and offers.

The compliance requirements for bids are less stringent than those for offers. This is because the nature of bid load is dependent on the underlying base “un-bid” load. It is not possible to measurably distinguish un-bid load from the bid-in load because the load measurement only captures the total load at the dispatch point. This is illustrated in the following example shown in Figure 2.

Public

Figure 2: Bid dispatch and effect of underlying un-bid load on total load level



Dispatched bid load floats on top of the un-bid load. The metered demand represents the sum of the un-bid and bid load. For example, the AESO may dispatch on the bid load while at the same time the un-bid load is dropping. If this occurs it appears as if the participant did not adequately respond to the dispatch on instruction. Conversely, if the un-bid load is increasing at the same time as the bid load is dispatched on it appears as if the load increased to a level much greater than the dispatch. Because of the unpredictable nature of the un-bid load, the rules are relatively silent on what constitutes bid compliance.

For example, in Figure 2 when the system marginal price (SMP) increases from $45/MWh to $75/MWh, block two (the 10 MW block priced at $50.00/MWh) is dispatched off and the load would be expected to decrease by 10 MW, but according to the real-time measurements the load increased by 10 MW. The price then jumps from $75/MWh to $240/MWh and the load would be expected to decrease another 10 MW following the dispatch instruction to do so. The price continues to climb to the price cap at $999.99 at which point the remaining 10 MW in block zero is dispatched off and the load would be expected to decrease another 10 MW. Meanwhile, fluctuations in the un-bid load occur.

Treatment of DTS and DOS capacity within a bid

The AESO's DOS modernization recommendation uses the bid as the means to replace the transaction request where the bid acts as an on/off switch for intent to use DOS capacity. The "dispatch on" would represent the start of the DOS transaction and the "dispatch off" would represent the end of the same transaction.

Public

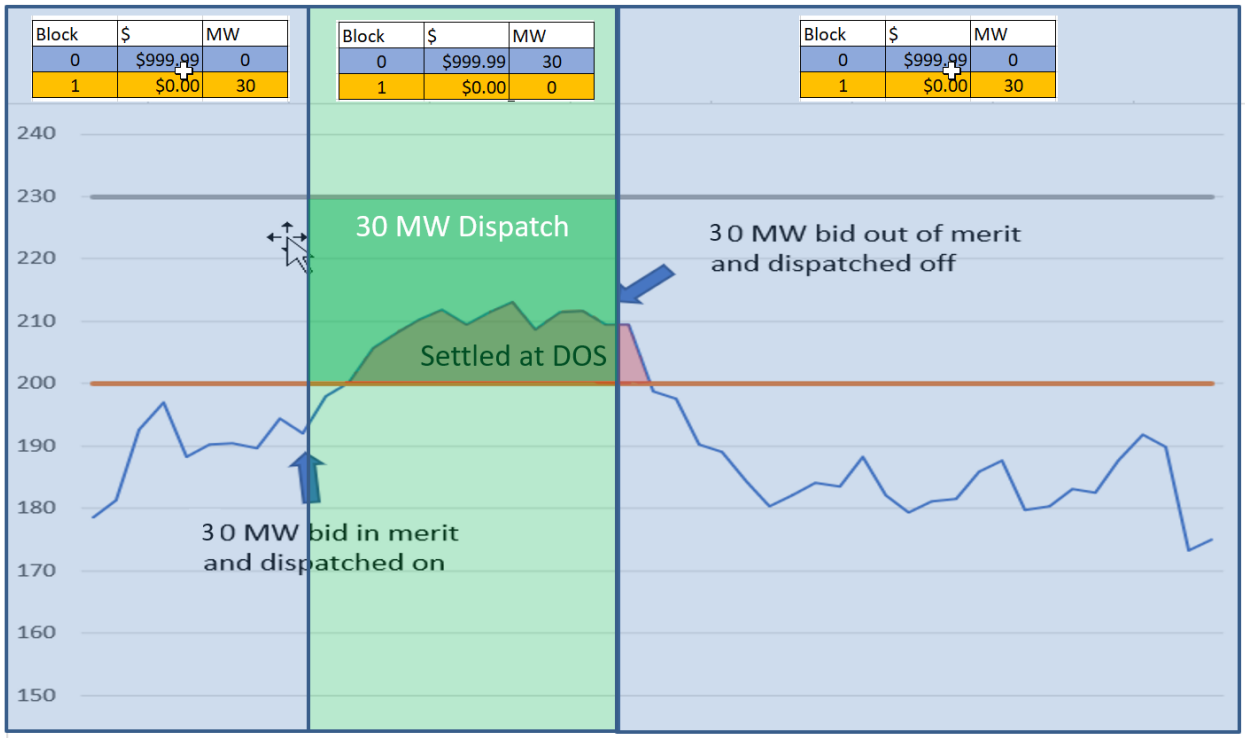
The AESO will assign the DOS participant with a sink asset whose capacity is equal to the volume of DOS contract capacity with which to submit a bid. The simplest way to approach bidding for the purposes of indicating the use of DOS capacity is for the participant to submit a bid with two blocks. Block zero is priced at $999.99/MWh and block one is priced at $0.00/MWh.

- If the participant is not planning to take DOS capacity in an hour the $0.00/MWh block will hold the DOS capacity and the $999.99/MWh block will have a block MW equal to zero. This effectively sets the DOS transaction switch in the off position.
- If the participant wishes to utilize the DOS capacity, the participant will move all, or the portion of the DOS capacity that the load wishes to consume, from the $0.00/MWh block to the $999.99/MWh block. This effectively sets the DOS transaction switch in the on position, for the amount of DOS capacity the participant wishes to use.

Toggling the energy between the two blocks will indicate to the system controller when the participant is taking or planning to take DOS energy and how much volume.

In the example shown in Figure 3, the participant starts off taking only DTS capacity by placing the 30 MW of DOS capacity in block one at $0.00/MWh. As per Section 203.3 of the ISO rules, *Energy Restatements*, at least two hours in advance of the hour the participant intends to use the DOS capacity, the bid for that hour is modified so the 30 MW of DOS capacity is priced at $999.99/MWh. At the top of the hour the bid will be in-merit and the system controller will issue a dispatch to the participant. This is equivalent to the start-time within the current DOS transaction request. The participant can leave the capacity in block zero for as many hours as the participant intends to use the DOS capacity.

Figure 3: Bid dispatch activates and deactivates the DOS transaction



Public

If the participant no longer wants to use the DOS capacity, the participant will move the energy from block zero ($999.99/MWh) into block one ($0.00/MWh) at least two hours in advance, as described in Section 203.3 of the ISO rules, *Energy Restatements*. At the top of the hour the system controller would dispatch the $999.99/MWh block off signaling to the participant that the DOS transaction has ended.

In the above example (Figure 3) it would appear the participant did not comply with the 30 MW dispatch instruction. Even though the bid was dispatched on for 30 MW, a maximum of 12 MW of DOS capacity was taken over the period. As explained in the example shown in Figure 2, the bid capacity was dispatched on but the underlying un-bid load was dropping off resulting in a net change of only 12 MW.

In the event the participant can no longer take DOS capacity due to an acceptable operating reason and wants to end the DOS transaction prematurely, the participant can, at any time, restate the volumes in the block and the system controller will dispatch the load off.

Settlement considerations of dispatch

If the DOS capacity was dispatched for any part of the hour, the hourly metered volume at or below the 200 MW DTS contract capacity will be settled in accordance with the DTS rate and the meter volume above the DTS contract capacity will be settled in accordance with the DOS rate.

Tariff settlement does not consider dispatch compliance, but DOS settlement is determined based on whether or not the DOS capacity was dispatched on.

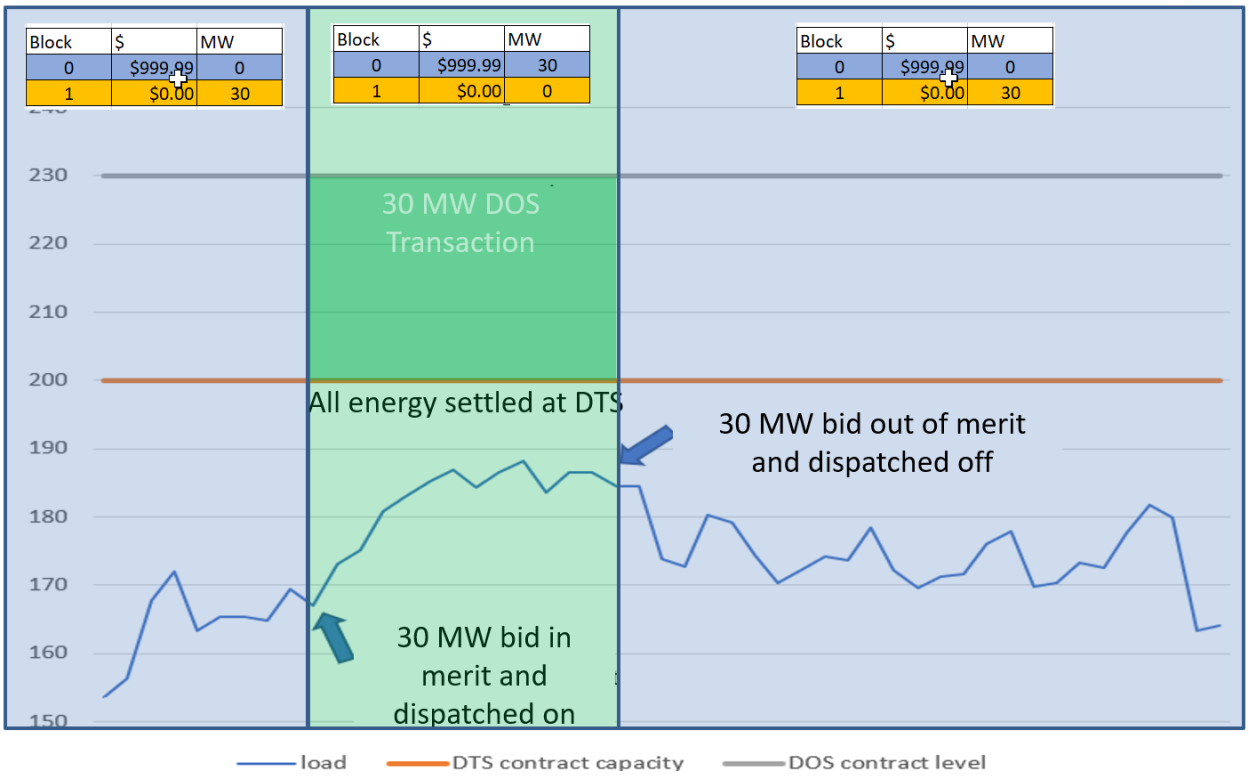
Dispatch without using the DOS capacity

Like in the previous example, in Figure 4 below, the participant submits a bid with two blocks. Block zero priced at $999.99/MWh and block one priced at $0.00/MWh. If the participant is not looking to take DOS capacity in the hour the $0.00/MWh block will hold the DOS capacity. If the participant wants to utilize the DOS capacity, the participant will move all or a portion of the DOS capacity from the $0.00/MWh block to the $999.99/MWh block.

The participant starts off taking only DTS capacity by placing the 30 MW of DOS capacity in block one at $0.00/MWh. As per Section 203.3 of the ISO rules, *Energy Restatements,* at least two hours in advance of the hour the participant intends to use the DOS capacity, modifies the bid so that the 30 MW of DOS capacity is priced at $999.99/MWh. At the top of the hour the bid will be in-merit, and the system controller will issue a “dispatch on” to the participant and acts as the start-time of the current DOS transaction request. The participant can leave the capacity in block zero for as many hours as the participant intends to use the DOS capacity. However, in this example the participant’s load never exceeded the DTS contract levels the entire time block zero was in-merit and the 30 MW of load dispatched on. In accordance with the proposed DOS modernization rate design, the hours where the capacity in block zero was in-merit will all be settled at Rate DTS as no DOS capacity was actually utilized.

Public

Figure 4:DOS energy is energy consumed above DTS levels

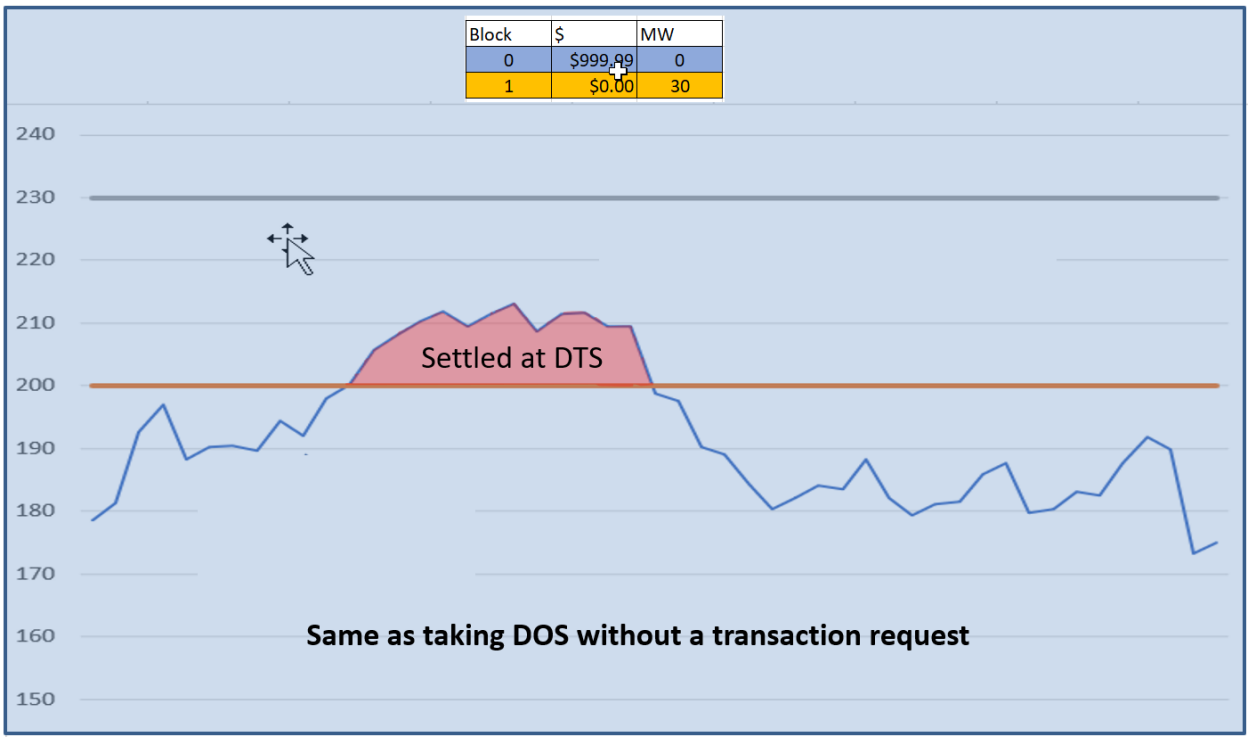


Using DOS capacity without a dispatch

In the proposed DOS modernization rate design, using DOS capacity without a corresponding dispatch is the same as using DOS capacity without submitting a transaction request under the current DOS rate. In both cases, all energy consumed above the DTS contract capacity will be allocated to DTS rather than DOS. For example, as shown in Figure 5 below, if the participant bids all MWs in block one, those MW remain out-of-merit and would not receive a dispatch on, assuming the price remains higher than $0.00/MWh. All energy consumed in this example would be assessed to Rate DTS.

Public

Figure 5: Using DOS capacity without a bid dispatch



Recalling DOS energy for constraint

If the participant has energy in the $999/MWh block and there is a need to recall the DOS capacity, the system controller would direct all or a portion of the $999/MWh block off by reducing the size of the block. The participant would receive a signal from the AESO's dispatch system (ADAMS) indicating the reduction in the available DOS capacity and a directive to only consume the remaining capacity, if any. When the capacity is restored the system controller will restore the volume in the energy merit order bid and the participant will be re-dispatched according to merit order.

The recall instruction is an instruction to not consume DOS capacity. It is not necessarily an instruction to reduce load. The participant load may already be below the DTS contract levels and there is no need to reduce load further. It will be the participant's responsibility to ensure the load is reduced to the appropriate level and sustained there. For example, if the directive was to no longer consume the entire 30 MW of DOS contract capacity the participant would need to ensure the total site load did not exceed DTS contract levels until dispatched to do so.

Recalling DOS energy for an EEA 1 alert

If the bid volume is priced at the top of the energy market merit order ($999.99/MWh) these are the last blocks dispatched before taking out of market actions to maintain system reliability during a supply shortfall. The instruction during an Energy Emergency Alert (EEA) 1 alert will be a dispatch off, to stop consuming energy in the $999.99/MWh block. Like the constraint recall example above, it will be the

Public

participant's responsibility to know whether they are consuming DOS energy at the time of the dispatch or not. The instruction is an instruction to stop consuming DOS energy and continue to not consume any DOS capacity until dispatched on (price drops below $999.99), which may or may not require a physical load reduction.

Failing to comply to DOS recalls

Failure to comply to an ISO directive to curtail DOS could result in suspension of DOS participation and a recalculation of the DTS contract capacity, administrative penalties, and the recovery of DTS revenue charged while under DOS.

Market terminology

Market terminology used in this document is defined in the *Consolidated Authoritative Document Glossary* located on the AESO website here:

Public

Estimating Rate Calculations

This illustrative tool is not authoritative and is for information purposes only and intended to provide guidance. In the event of any discrepancy between this tool and any authoritative document[1] in effect, the authoritative document governs.

1 Purpose

This illustrative tool is intended to allow stakeholders to review an estimate of future rates under the AESO's Preferred Rate Design (described in the AESO's Bulk and Regional Tariff Design Stakeholder Engagement Session 5 published on March 18, 2021 and presented in the corresponding AESO's Stakeholder Session 5 on March 25, 2021, and Technical Session II) by adjusting billing determinants and revenue requirement.

The description and explanations in this illustrative tool provide example calculations under the Preferred Rate Design only. The AESO calculates certain actual charges on an hourly basis rather than on average annual amounts, and ***actual charges under any future tariff design will differ from the estimated amounts presented in this illustrative tool due to actual inputs differing from these estimates***.

2 Use of the Estimating Rate Calculations Tool

This section describes how stakeholders may use the illustrative tool to understand an estimate of future impacts of the AESO's Preferred Rate Design. The calculations included here are in summary form. Detailed rate calculations to determine actual charges applied for to the Alberta Utilities Commission will be in a longer format, similar to the Rates Calculations spreadsheets filed in every ISO tariff update application.

Estimated Rate Calculations

This tab includes future estimates of rate calculations resulting from changes to the Bulk and Regional cost recovery functionalization (Column A and Lines 7 through 9)

Sources for information are included as Notes on this tab

For assistance with this tool and Site Data Input data, please contact the AESO at: tariffdesign@aeso.ca

Stakeholder Comments on the AESO's Estimating Rate Calculations – July 16, 2021

Company	Stakeholder Comments
AltaLink Management	• No comments on Import/export revenue • Highlight the fact that the revenue requirement values for the 2020 and 2021 test years have changed in the updated Calculations Tool (line 9, columns C and D). The values no longer tie to the 2020 and 2021 Tariff Update applications. I believe the AESOs filed Tariff 2020 and 2021 Updates included an estimate for import/export revenue; it appears, on the surface, that these amounts are now double-counted.* **The AESO responded to this comment by publishing Estimating Rate Calculations Tool v0.3 on its website on July 15, 2021.*
CWSAA	See attached submission
Heartland Generation	Question: Relatively minor, but curious about how the "Estimated DOS/XOS Rate" in cells F38 and F42, respectively, are calculated. The $15 estimates don't seem to be a simple average of the test rates (inclusive or exclusive of 2019-2021 test years). It is likely that this value is a very rough approximation without a strict associated calculation. Any information on these values and how they are calculated would be appreciated. Concerns: Further to Heartland Generations comments on Session 6B, we are concerned about the significant and material impact of the drastic increase to rate XOS. This sudden increase to rate XOS during all hours of the year will have serious repercussions to the commercial viability of exports in the vast majority of hours. This is especially true of traditionally lower-priced hours when exports could take advantage of opportunities in neighbouring markets. During these periods of depressed Alberta pool prices, exporters can remain operational and provide reliability/ancillary services/etc. products to the Alberta grid while collecting the foreign price for the majority of production. It is my understanding that the doubling of rate XOS (as this estimate indicates) will evaporate these economic opportunities by eliminating an already slim price spread. This will subsequently force Alberta generators to possibly shutoff during periods when they could have remained operational/online (and thus no longer provide ancillary support to the Alberta grid). Further, the impact of these increased rate XOS fees are felt primarily during periods of lower grid utilization and/or system stress. Charging rate XOS as a flat energy charge is contrary to logic, and at a minimum the AESO should investigate and report on the correlation between rate XOS usage and transmission system costs/stress. A possible conclusion from this report could be a profiling of rate XOS to best reflect transmission capacity/costs through time; there is inherent logic behind shaping rate XOS as different $/MWh charges at different hours of the day. The designation of rate XOS as an opportunity service best illustrates the need to modernize all opportunity service products considering the preferred tariff design. As is, the estimated rate XOS will cause market harm to an already fragile intertie relationship as exports will be further disincentivized relative to the treatment of imports.

Company	Stakeholder Comments
	Heartland Generation requests that the AESO conduct further consultation regarding rate XOS modernization. This could begin with an AESO impact assessment of increasing the associated charges by almost double in all hours for exporters. This research should include impacts to perceived fairness between imports/exports on the intertie and consequences of disincentivizing exports on the domestic Alberta markets for ancillary services and other similar products.
IPCAA	In its spreadsheet, the AESO has used information from the 2020 Long-Term Transmission Plan based on the AESO's Reference Case to calculate Rate DTS - Rates IPCAA would recommend that: • The AESO also provide Rate DTS - Rates based on the "High Cogeneration Sensitivity" scenario. With rising carbon prices and the financial and environmental incentives for industry to install co-generation, the "High Cogeneration Sensitivity" scenario could very well materialize. • The AESO also provide an equivalent analysis for the four distribution utilities. The AESO should include the unit rates ($/kW and $/kWh) for each utility so that consumers can carry out rate impact assessments. Without this information, it will be extremely difficult for consumers to provide evidence to the AUC on potential impacts caused by the proposed tariff design.
MATL	1. MATL understands that the new tariff redesign will increase the cost of exporting energy from Alberta (i.e., through higher XOM/XOS charges, or additional charges beyond XOM/XOS). MATL has the following questions: (a) How will the AESO determine the new XOM/XOS rate, and/or other charges? The AESO has provided a calculator on July 7, 2021 & July 15, 2021. Please provide an example calculation in an excel spreadsheet (with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. Please demonstrate all potential impacts to XOM/XOS within the calculator and explain how it may impact MATL and its customers. Please provide further explanation on the rationale of the 20% multiplier applied to the Bulk & Regional System Calculations, and the 32% multiplier applied to the Ancillary Services Revenue Requirement. (b) Will the cost increase be higher or lower when compared to services that are recalled after XOM/XOS such as DOS? Please provide an example calculation in an excel spreadsheet (with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff, including proposed mitigations. (c) The AESO has assumed in its rate calculator that the export volumes will be 130,000MWh in the future. Please explain the basis for this amount and how the AESO assessed the amount of export volumes that will result from higher XOM/XOS rates? Please demonstrate the reduced exports that will result from an increase in the XOM/XOS rates. Please provide an example calculation in an excel spreadsheet (with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. (d) Is the AESO expecting an overall reduction in offsets from export opportunity service revenue? If so, by how much? (e) Please list and fully explain all mitigations that will be put in place by the AESO for stakeholders impacted by the increase in XOM/XOS charges? Please also list and fully explain all mitigation that will not be put in place by the AESO and the reason for them not being considered.

Public

Company	Stakeholder Comments
	(f) Non-firm interruptible rate class was not accepted by the AESO for DOS mitigations as described in the Session 6B on June 24, 2021. Given that XOM/XOS is already a non-firm interruptible rate class, please explain if revisiting the method for calculating XOM/XOS charge would avoid adverse impacts to exports. Please explain the impact if the AESO tariff were to provide firm transmission service for XOM/XOS services. 2. Will the new tariff redesign increase the cost of importing energy into Alberta (i.e., through higher IOS charges, or additional charges beyond IOS)? If yes: (a) How will the AESO determine the new IOS rate, and/or other charges? Please provide an example calculation in an excel spreadsheet(with all formulas available) with the current AESO Tariff and under the proposed AESO Tariff. (b) How has the AESO assessed the reduced import volumes that will result from higher IOS rates? (c) With respect to the AESO's existing and future practices of operating international cross border interties, has the AESO considered compliance to the United States-Mexico-Canada Agreement (USMCA)? With these comments, MATL Canada & MATL LLP is also reiterating its request that the AESO consult with MATL and its customers on the proposed changes to XOM/XOS rates, as there will be a material impact beyond the 10% threshold set by the AESO. MATL is available to discuss the above questions and comments. Due to vacation schedules, anytime after August 10 would be the best time to schedule a consultation.
TCE	The updated rate estimate included for the first time the impact to Rate XOS resulting from the AESO's proposed Bulk & Regional rate design. The following comments are with respect to Rate XOS. As a Rate XOS customer, TC Energy is concerned that the proposed rate design will cause Rate XOS to increase by approximately 80%. This is substantial and can be expected to significantly impact future export opportunities. TC Energy is further concerned that Rate XOS will be inconsistent with prior Commission rulings and cost causation. As a result, we recommend that the AESO consult with parties specifically with respect to Rate XOS. TC Energy has the following questions with respect to Rate XOS: 1. What mitigation measures will the AESO propose for Rate XOS customers that will see an 80% rate impact? 2. What impact will this rate increase have on future exports?
TransAlta	TransAlta appreciates the AESO revised Estimated Rate Calculations Tool but has concerns with the lack of information on the rate for export opportunity services. The estimates provided by the AESO include a significant increase to rate XOS/XOM from the current ~ $8/MWh to ~$15/MWh. TransAlta recommends the AESO to hold further consultation to openly discuss with stakeholders its proposal for rate XOS/XOM including a discussion about any analysis that the AESO has performed on cost-causation including any alternatives that were considered as the methodology behind this proposed XOS/XOM rate. The AESO has not justified the proposed increase to rate XOS/XOM in terms of cost causation and efficient price signals and has not provided information about the impact of the preferred rate design on energy exports. It is unclear how the change to allocate more costs to the energy component is reasonably driven by exporting electricity from the province. The AESO is sending a price signal that represents a significant change to the economics of exporting. We are concerned that this rate change will have unintended consequences and would

Public

Company	Stakeholder Comments
	like to understand the AESO's analysis of how this change could impact export activity. The substantial increase in rate XOS/XOM could potentially reduce demand to export which in turn may reduce the contribution from XOS/XOM to transmission costs and create a shortfall that needs to be recouped from other customers. The AESO must demonstrate that its proposed rate XOS/XOM is not discriminatory and is not treating customers unfairly. We recommend that the AESO explain stakeholders how it determined the appropriateness of applying such a significant increase in the energy charge for the new XOM/XOS rate and provide any analysis that was undertaken of the expected impacts of the proposed change to export activity. We wish to understand the basis for the AESO's estimate that export volumes will be 130,000 MWh/year and will remain at that level for future years and request the analysis that was conducted to determine this estimate. We are concerned with the distorting effect that such a high export rate could have on the wholesale market, which will reduce the attractiveness of and opportunity for export sales, and could result in higher costs to Albertans - Alberta generators would be even more reliant on the Alberta market to earn all of their revenues. Furthermore, we recommend that the AESO consider phasing in this rate over time to provide the market time to adjust to this significant increase in rate just as it is doing with other industrial customers that are being impacted with costs that are greater than 10% of the current rate. Finally, it is unclear whether the new tariff redesign will increase the cost of importing energy into Alberta through higher IOS charges. The AESO should provide this information before filing its tariff, including details about how will the AESO determine the new IOS rate, and/or other charges and assessment of impact on import volumes that will result from higher IOS rates.

Public

CWSAA – Comments & Questions Regarding AESO Updated Rate Estimates

SUMMARY

" Comments and questions regarding the updated rate estimates can be submitted by email to tariffdesign@aeso.ca by July 16, 2021. "

The vast majority of Alberta's electricity consumers receive a flow-through of the AESO's transmission tariff through their local distribution company. The AESO's preferred tariff structure would have potentially major impacts, which can only be assessed by using a distribution flow-through version of that tariff. The information provided by Fortis, EPCOR and ENMAX is insufficient to carry out the required impact assessments; the actual tariff rate sheets are necessary.

The companies also have an inconsistent jumble of demand ratchet policies, which are being applied to AESO bulk tariff charges which have no demand ratchet. This monstrous regulatory inefficiency must be addressed, lest customers literally across the street from one another receive radically different impacts from the single, standard provincial transmission tariff.

With the AESO's coordination, the distribution companies will surely cooperate in providing this information; if cooperation is not forthcoming, the AUC's guidance may be necessary.

6.4 THE RATE DESIGN METHOD 9

1 CONTEXT OF COMMENTS

> "The Commission expects parties to provide evidence of the potential impacts of any proposed bulk and regional tariff rate design as part of the Commission's consideration of the application." [1]

The AESO's bill impact tool will be very useful for parties who are served at the transmission level. Unfortunately this tool is of no assistance in assessing potential impacts on the majority of Alberta's electric system customers, who are served through distribution utilities' unique versions of the standard, province-wide AESO tariff.

The industry's fragmentation into separate transmission and distribution entities has led to significant seams issues between the two areas, some of which are currently under regulatory review. The AESO tariff flow-through is another such seams issue which must be addressed in order for customer representatives to estimate and analyze these potential rate impacts.

2 DISTRIBUTION UTILITIES ARE INDIFFERENT TO TRANSMISSION FLOW-THROUGH

Ever since PBR Decision 2012-237, para. 666:

> …the AESO related cost items will be dollar-for-dollar flow-through items in the [electric distribution] companies' PBR plans "

The electric distribution companies can neither gain nor lose in this flow-through process, and should therefore be supportive of any calculations and analysis required for its implementation.

3 ASSESSING THE DIFFICULTY OF ESTIMATING DISTRIBUTION FLOW-THROUGH RATES

One might hypothesize that all the data required to estimate distribution flow-through rates under the AESO's preferred tariff design is already available, and it should be a simple matter for customer representatives to calculate these rates in their impact analysis.

To test that hypothesis, the appended analysis reviews the publicly available data and calculation tools.

[1] 25175_X0142_2021-06-01 AUC letter - Ruling on the Alberta Electric System Operator extension request _000175, para.9

[1] The existing and preferred AESO DTS rates are known, and

[2] the forecast DTS & DT rate class billing determinants are said to be available in the annual PBR rate adjustment proceedings.

[3] In those PBR applications, both FortisAlberta and EPCOR Distribution & Transmission provide forecast transmission revenues by rate class, which can be compared to the revenue forecasts provided in the AESO impact analysis. For unknown reason(s), the numbers do not match, and the variances seem quite random.

[4] To assess the overall rates process, the current transmission rate can be compared to the rates implied in the companies' AESO tariff impact analysis.

The residential rate class is universally billed on a ¢/kWh basis for transmission charges, which simplifies the analysis. The implied rate as per the impact analysis can be calculated by taking the stated revenues and dividing them by the PBR forecast. (Except for ATCO, whose impact analysis has not yet been provided).

The result is somewhat disconcerting: the numbers don't match, by a significant amount.

	Total 2019 DTS (On Currently Approved AESO Structure)	2021 Energy (kWh)	Implied Unit Rate	Current Tariff Rate	$ Difference	% Difference
	[A]=Data	[B]=Data	[C]=[A]/[B]	[D]=Data	[E]=[D]-[C]	[F]=[E]/[D]
ATCO Electric Inc.	< Not Provided >	1,400,729,231				
ENMAX Power Corp.	$ 112,475,630	3,044,093,073	$ 0.03695	0.038763	$ 0.0018	4.7%
EPCOR Distribution & Transmission Inc.	$ 77,126,402	2,316,573,488	$ 0.03329	0.03610	$ 0.0028	7.8%
FortisAlberta Inc.	$ 139,040,000	3,339,937,368	$ 0.04163	0.04394	$ 0.0023	5.3%

This analysis in no way suggests that the companies have made any errors in their calculations. There are no doubt several calculation errors in the analysis above, which a technical expert who works with these calculations on an everyday basis would be able to identify.

Its purpose is only to demonstrate that it is extremely difficult to confidently calculate the transmission unit rates that the companies must have used in their internal calculations. The only way in which the typical bill impacts could have been accurately calculated is if the companies had worked out the actual tariff unit rate components. Since this information must already exist, the distribution companies should kindly provide it (with the possible exception of ATCO Electric, which does not appear to have provided any tariff impact analysis).

Without knowing the electric distribution companies' flow-through rates, it is extremely difficult for parties to estimate the customer impacts of the AESO's preferred tariff design option.

4 INCONSISTENCY OF COMPANIES' TRANSMISSION TARIFF FLOW-THROUGH

Both the current and the preferred AESO tariff structures recover bulk / demand related charges through a monthly unratcheted billing determinant. However the distribution utilities have a collectively chaotic jumble of ratchet policies, summarized in the following table. **ATCO Electric** consistently uses an 85% X 12 month ratchet, **ENMAX Power** consistently uses a 90% X 12 month ratchet, while **EPCOR** covers all alternatives.

In **Fortis'** 2012-2014 Phase II Distribution Tariff proceeding (ID 2363, Decision 2014-018), the Commission concluded "that mirroring of the AESO's charges in Fortis' rates is consistent with cost causation" [¶175] and as a result Fortis is the only company that mirrors the AESO's current and proposed rate structures for its general service rate classes.

	TREATMENT OF UNRATCHETED TRANSMISSION CHARGE (Bulk / Demand)				
		Monthly	85% X 12 Mon	90% X 12 Mon.	90% X 24 Mon.
FAI	RATE 22 - FARM SERVICE – DEMAND METERED		X		
FAI	RATE 41 - SMALL GENERAL SERVICE	X			
FAI	RATE 45 - OIL & GAS SERVICE		X		
FAI	RATE 61 - GENERAL SERVICE	X			
FAI	RATE 63 - LARGE GENERAL SERVICE	X			
EDTI	Commercial/Industrial 50 kVA to <150 kVA			X	
EDTI	Commercial/Industrial 150 kVA to <5,000 kVA		X		
EDTI	Primary Commercial/Industrial 150 kVA to <5,000 kVA		X		
EDTI	Commercial/Industrial Greater than 5,000 kVA				X
EDTI	Commercial/Industrial Greater than 5,000 kVA Totalized				X
EPC	Rate D300 - Medium Commercial			X	
EPC	Rate D310 - Large Commercial - Secondary			X	
EPC	Rate D410 - Large Commercial - Primary			X	
AE	Rate D21 - Standard Small General Service		X		
AE	Rate D24 - Standard Small General Service - Isolated Industrial Areas		X		
AE	Rate D31 - Large General Service / Industrial - Distribution Connected		X		
AE	Rate T31 - Large General Service / Industrial - Transmission Connected		X		
AE	Rate D32 - Generator Interconnection & Standby Power		X		
AE	Rate D34 -Large General Service / Industrial - Isolated Industrial Areas		X		
AE	Rate D41 - Small Oilfield and Pumping Power		X		
AE	Rate D44 - Small Oilfield and Pumping Power - Isolated Industrial Areas		X		

The AESO's preferred tariff structure greatly increases the importance of knowing the individual tariff rate components. The unratcheted 'bulk' system charge is dropping by 41% while ratcheted 'regional' system charge is dropping by 23%; this is offset by a 367% increase in the energy charge.

With such massive dislocations occurring, accurate end user rates are essential. Most customers' consumption shows some degree of seasonality, and the preferred tariff structure would greatly alter the costs flowing from seasonal usage.

The Commission has directed Fortis to flow the 'bulk' system charge through to end use customers using "CWSAA's proposed new billing determinant of un-ratcheted 'kW of billing period capacity' for rates 61 and 63." [2014-018 ¶175] The 'kW of billing period capacity' is simply 'the highest metered kW demand in the billing period', a value which is readily available for all demand-metered customers.

The Electric Utilities Act contains a clear policy statement regarding the AESO tariff, that

> (3) The rates set out in the tariff
>
> (a) shall not be different for owners of electric distribution systems, customers who are industrial systems or a person who has made an arrangement under section 101(2) as a result of the location of those systems or persons on the transmission system, and
>
> (b) are not unjust or unreasonable simply because they comply with clause (a).

It is of course reasonable that the AESO tariff flow-through by electric distribution companies reflect local system realities; but these inter-company differences appear to be historical accidents, left unaddressed ever since the change in AESO tariff structure in 2006. This is surely an opportunity to improve regulatory efficiency by adopting a consistent tariff flow-through approach.

Without prejudice as to the ultimate outcome, customers need to assess the potential impacts of a more accurate, harmonized tariff flow-through. This should be provided as an alternative scenario, in addition to rates under the current companies' tariff structures.

5 RELIEF REQUESTED – AESO COORDINATION OF ANALYSIS

What is required is a set of System Access Service rate schedules from each of the utilities, with all the required unit rates populated using the AESO's preferred tariff design, and a narrative defining the specific data sources and calculations used. These unit rates must already exist, given that the companies have calculated typical bill impacts.

The AESO is responsible for its tariff application, and for enabling parties to assess the impacts of its proposals. The AESO is therefore responsible for coordinating with the electric distribution companies to provide the flow-through rates that are required to assess "the potential impacts of any proposed bulk and regional tariff rate design."
In the unlikely event that the companies were not cooperative, the AESO could seek guidance from the AUC. In the unlikely event that the AESO is unwilling to provide this coordination, the parties could approach the AUC with a request that the necessary unit rates be provided.

6 TECHNICAL REVIEW OF DATA & CALCULATION TOOLS AVAILABLE

The required data and calculation tools are described in the identically worded notes to the three utilities' rate impact calculations (see endnote): [i]

1. "Analysis completed by <Company> based on its Transmission Cost Allocation method and Rate Design to DT rate classes as currently approved by the Commission."

2. "Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in <Company's> 2021 Annual PBR rate filing) as summed across all <Company's> D-connected PODs."

To summarize, the two inputs are prices and volumes:
[1] the AESO 2019 DTS rates, and
[2] the forecast DTS & DT rate class billing determinants [per PBR filings]. [2]

The two calculation processes are allocation and rate design:
[3] the Transmission Cost Allocation method (to rate classes), and
[4] the Rate Design method.

6.1 AESO 2019 DTS Rates

The AESO 2019 DTS rates are publicly available, per the AESO (see for example the Bill Calculation Tool, tab "Adjust Load Profile") :

Connection Charge					
Bulk System Charge					
3(a)	Coincident metered demand	$10,087.00	/MW/month	$5,980.00	/MW/month
Regional System Charge					
3(b)	Billing capacity	$2,668.00	/MW/month	$2,055.00	/MW/month
Energy Charge					
3(c)	Metered energy	$2.18	/MWh	$10.19	/MWh

[2] "Forecast billing determinants are generally used to allocate K, K-bar, Y and Z factors to rate classes and to calculate the resulting rate adjustments." [25843_X[]_25843-D01-2020 Fortis 2021 Annual PBR Rate Adjustment_000103 ¶ 39, see also 25864_X[]_25864-D01-2020 AE 2021 Annual PBR Rate Adjustment_000055 ¶ 35, and 25865_X[]_25865-D01-2020 EPC 2021 Annual PBR Rate Adjustment_000060 ¶ 32]

6.2 Forecast DTS & DT rate class billing determinants

[2] Forecast DTS & DT rate class billing determinants are available in the annual PBR filings:

Proceeding	Description
25866	EDTI 2021 Annual PBR Rate Adjustment Filing
25865	ENMAX Power Corporation 2021 PBR Rate Adjustment Application
25864	ATCO Electric 2021 Performance Based Regulation ("PBR") Rates Application
25843	FortisAlberta 2021 Annual Rate Adjustment Filing

However the availability of information differs greatly between the four companies.

- FortisAlberta provided a 'bottom up' transmission cost, revenue and annual transmission rate update (TACDA) together with the load forecast as part of its annual PBR filing ID 25843. [3]
    - Note that Fortis uses (unratcheted) 'Monthly non-coincident peak demand' to allocate bulk system transmission charges. [ii]
    - The other three companies use the same ratcheted billing demand approach for both bulk and regional charge recovery (discussed above).

- EPCOR Distribution & Transmission also provided a 'bottom up' transmission update together with the load forecast. [4]

- ATCO Electric provided a 'top down' 2021 transmission rate update in its 2021 PBR application, applying "a scaling approach to its 2020 transmission rates approved in Decision 25645-D01-2020."[5]

- ENMAX Power did not address transmission rate updating in its 2021 PBR application. [6]

[3] "64. In its application, Fortis requested approval of its 2021 SAS rates, to be effective January 1, 2021.56 Fortis indicated that its proposed 2021 SAS rates reflect the rates applied for by the AESO in Proceeding 26054…."
"65. Fortis indicated that to determine the rate class-specific changes in the transmission access component for distribution-connected rate classes, it used the methodologies from its last Phase II distribution tariff application, approved in Decision 2014-01860 and the associated compliance filing, Decision 2014-224."
[4] 25866_X[]_25866-D01-2020 EDTI 2021 Annual Performance-Based Regulation Rate Adjustment, ¶ 59
[5] 25864_X[]_25864-D01-2020 AE 2021 Annual PBR Rate Adjustment, ¶ 49
[6] 25865_X[]_25865-D01-2020 EPC 2021 Annual PBR Rate Adjustment, ¶ 32

6.3 Transmission Cost Allocation method (to rate classes)

The Fortis and EPCOR forecasts contain transmission rate class revenue forecasts which can be compared with the forecasts provided in the AESO impact analysis, as follows. (Note that the % differences are quite irregularly distributed.)

FORTIS ALBERTA INC.

25843_X0005.01_Schedule 3.2 2021 Updated Transmission Cost Allocation - Tab 3.2B DTS Connection

Summary of Transmission Costs by Rate Class ($ 000)

Line	Rate Class Description	Total AESO DTS Charges [A]=Data	Total 2019 DTS (On Currently Approved AESO Structure) [B]=Data	$ Difference [C]=[B]-[A]	% Difference [D]=[C]/[B]
1	Residential	$ 137,071	$ 139,040	$ 1,969	1.4%
2	FortisAlberta Farm	$ 28,011	$ 28,269	$ 258	0.9%
3	REA Farm	$ 23,287	$ 23,575	$ 288	1.2%
4	FortisAlberta Irrigation	$ 17,162	$ 16,637	$ (525)	-3.2%
5	Exterior Lighting	$ 1,964	$ 1,956	$ (8)	-0.4%
6	Small General Service	$ 53,749	$ 56,522	$ 2,773	4.9%
7	Oil and Gas	$ 24,216	$ 25,391	$ 1,175	4.6%
8	General Service	$ 208,561	$ 230,570	$ 22,009	9.5%
9	Large General Service	$ 110,269	$ 113,876	$ 3,607	3.2%
10	Distribution-Connected	$ 604,291	$ 635,836	$ 31,545	5.0%

EPCOR DISTRIBUTION & TRANSMISSION INC.

25866_X0007.01_Appendix E - 2021 SAS COSS_Blackline, Tab SAS-1a 2021

Table 2 - SAS Revenue Requirement Allocated to SAS Rate Classes

	Revenue requirement w/o DC and CST	Total AESO DTS Charges [A]=Data	Total 2019 DTS (On Currently Approved AESO Structure) [B]=Data	$ Difference [C]=[B]-[A]	% Difference [D]=[C]/[B]
1	Residential	$ 79,956,127	$ 77,126,402	(2,829,725)	-3.7%
2	< 50kVA	$ 25,662,480	$ 24,725,583	(936,897)	-3.8%
3	50 to 149 kVA	$ 34,863,775	$ 33,609,945	(1,253,830)	-3.7%
4	150 to 4,999 kVA	$ 65,514,148	$ 63,044,365	(2,469,783)	-3.9%
5	Direct Connects *	$ 10,560,340	$ 10,282,842	(277,498)	-2.7%
6	150 to 4,999 - Primary	$ 22,882,916	$ 21,321,132	(1,561,784)	-7.3%
7	>5,000 kVA - Primary (CS)	$ 23,075,648	$ 22,059,494	(1,016,154)	-4.6%
8	CST *	$ 7,511,504	$ 7,347,761	(163,743)	-2.2%
9	Street Lights	$ 805,593	$ 1,059,008	253,415	23.9%
10	Traffic Lights	$ 119,524	$ 118,991	(533)	-0.4%
11	Lane Lights	$ 50,458	$ 49,369	(1,089)	-2.2%
12	Security Lights	$ 69,940	$ 68,725	(1,215)	-1.8%
13	**Total**	271,072,454	260,813,617	(10,258,837)	-3.9%

There are surely good reasons for these differences, but considerable research appears necessary in order to elucidate their causes; the data come from different sources at different times, involving several different years and critical adjustments like loss factors between the point of delivery and the customer meter.

Since there are no specific sources listed for the companies' calculations, the search for understanding may be prolonged. For ENMAX and ATCO, the challenge is somewhat greater given the lesser amount of available information.

6.4 The Rate Design method

For rate classes billed on energy only (residential, small commercial…), calculating unit rates under the existing and proposed rates should in principle be simple. We need only divide the calculated dollar amounts by the kWh energy forecast to obtain the two rates.

The energy data source is "the forecast DTS and DT rate class billing determinants (as approved in <Company's> 2021 Annual PBR rate filing) as summed across all <Company's> D-connected PODs."

Proceeding	Description	Source File	Reference	2021 kWh
25864	ATCO Electric 2021 Performance Based Regulation ("PBR") Rates Application	25864-X0051, AE-AUC-2020NOV26-001(b) Attachment 3, Appendix I, schedules S.1-S.3	2.1 Summary of Billing Determinants by Revenue Class - Cell I13	1,400,729,231
25865	ENMAX Power Corporation 2021 PBR Rate Adjustment Application	25865_X0046_Appendix 5 - Rate Schedules_000046	13.0 2020-2021 Monthly Billing Determinants and Q Factor Supporting Calculations - Cell AD13	3,044,093,073
25866	EDTI 2021 Annual PBR Rate Adjustment Filing	25803_X0016_EDTI-AUC-2020SEP14-003 Attachment 1_000016	2.0 Revenue True-up of The Previous TAC Annual Rider - Cell D31 (from Sch. 9.0)	2,316,573,488
25843	FortisAlberta 2021 Annual Rate Adjustment Filing	25843_X0007_Schedule 2.4 A to D - 2021 Billing Determinants and Analysis_000007	2.4-B 2021 BD Comparision - Cell H12	3,339,937,368

Taking the revenue data provided by the companies in their impact analyses, "Total 2019 DTS (On Currently Approved AESO Structure)", and calculating a ¢/kWh unit rate that can be compared to current tariffs, we have: [7]

	Total 2019 DTS (On Currently Approved AESO Structure)	2021 Energy (kWh)	Implied Unit Rate	Current Tariff Rate	$ Difference	% Difference
	[A]=Data	[B]=Data	[C]=[A]/[B]	[D]=Data	[E]=[D]-[C]	[F]=[E]/[D]
ATCO Electric Inc.	< Not Provided >	1,400,729,231				
ENMAX Power Corp.	$ 112,475,630	3,044,093,073	$ 0.03695	0.038763	$ 0.0018	4.7%
EPCOR Distribution & Transmission Inc.	$ 77,126,402	2,316,573,488	$ 0.03329	0.03610	$ 0.0028	7.8%
FortisAlberta Inc.	$ 139,040,000	3,339,937,368	$ 0.04163	0.04394	$ 0.0023	5.3%

The AESO's proposal represents major tariff structure change which cannot be assessed by simple rate class % impact calculations. Particularly for seasonal customers (which the CWSAA's ski hill members all are) it is essential to have the actual transmission tariff flow-through rate structures for impact assessment.

All that is needed here is for the four distribution utilities to make public the calculations which three of them have already completed but not disclosed. The three co-operating distribution utilities (EDTI, EPC and FAI) have all provided the same format of information, which speaks to a degree of helpful coordination for which AESO no doubt deserves the credit.

In particular, the estimated impacts on low / typical / high usage customers could only be calculated if unit rates ($ / kW, $ / kWh) had been calculated. Please provide those unit rates, so that customers can carry out rate impact assessments.

There are at least four possible resolutions to this situation:

[A] The AESO could coordinate the four distribution utilities' voluntary provision of this information, and if full cooperation is not forthcoming then

[B] The AESO could itself carry out these calculations, which would ensure transparency and broad access to consistent estimates. Presumably the AESO would itself have understood, reviewed and confirmed the distribution utilities' calculations, and would have the expertise to carry out these calculations as needed.

[C] Industry participants could individually carry out these calculations, likely with different results depending on assumptions made, which could well waste considerable time in the regulatory process as the varying customer impact calculations would then need to be compared through litigation.

[7] Sources: https://www.enmax.com/ForYourBusinessSite/Documents/2021-07-01-DT-Tariff-Rate-Schedule.pdf
https://www.epcor.com/products-services/power/rates-tariffs-fees/Documents2/sas_april2021.pdf
https://www.fortisalberta.com/docs/default-source/default-document-library/2021-july-rates-options-and-riders.pdf?sfvrsn=7eaf9e1b_4

[D] Any party could presumably make a motion in Proceeding 25175 requesting that the AESO or the distribution utilities be directed to provide the necessary customer level rates, so that consistent impact assessments can be carried out by the industry.

ENDNOTES

[i] **Electric distribution companies' statements re: transmission cost allocation & rates:**

FortisAlberta Inc.

1. Analysis completed by FortisAlberta based on its Transmission Cost Allocation method and Rate Design to DT rate classes as currently approved by the Commission.

2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in FortisAlberta's 2021 Annual PBR rate filing) as summed across all FortisAlberta D-connected PODs .

ENMAX Power Corp.

1. Analysis completed by EPC based on its Transmission Cost Allocation method and rate design to DT rate classes as currently approved by the Commission.

2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in EPC's 2021 Annual PBR rate filing) as summed across all EPC D-connected PODs.

EPCOR Distribution & Transmission Inc.

1. Analysis completed by EPCOR based on its approved System Access Service Cost of Service and Rate Design methodology.

2. Transmission Cost Allocation and Rate Design uses AESO 2019 DTS rates (as presented in AESO Session 5) and the forecast DTS and DT rate class billing determinants (as approved in EPCOR's 2021 Annual PBR rate filing) as summed across all EPCOR Distribution-connected PODs

[ii] **FortisAlberta – Transmission Cost Allocation Summary**
