

Long-Term Adequacy Report

August 2026

Introduction

The following report provides information on the long-term adequacy of the Alberta electric energy market. The report contains metrics that include tables on generation projects under development and generation retirements, an annual reserve margin with a five-year forecast period at the time of system peak, a two-year daily supply cushion, and a two-year probabilistic assessment of the Alberta Internal Load (AIL). The Long-Term Adequacy (LTA) Metrics provide an assessment and information that can be used to facilitate further assessments of long-term adequacy. This report is updated quarterly in February, May, August, and November. Inquiries on the report can be made at forecast@aeso.ca.

Summary of Installed Capacity and Projects Under Development

Table 1 below summarizes the total capacity of installed generation and generation projects at various stages of development in Alberta. For more information on specific projects, see the Summary of Changes Since Last Report and New Generation and Retirements Metric sections.

Table 1: Summary of capacity of generation and storage projects¹

Stage	Solar (MW)	Wind (MW)	Storage (MW)	Gas (MW)	Hydro and Other (MW)	Total (MW)
Operational	1,928	5,684	351	14,201	1,376	23,540
Met Project Inclusion Criteria	3,032	619	464	951	-	5,066
Received AUC Approval	1,157	-	570	2,319	-	4,046
Announced	2,636	153	1,691	3,814	-	8,294
Total	8,752	6,456	3,076	21,286	1,376	40,946
2-Year Average Alberta Internal Load (AIL) Forecast				10,440 MW		

¹ Total operational capacity in Table 1 may differ from the [Current Supply and Demand Report](#) (CSD). This occurs when an in-service generation project is not included on the CSD page as a new or separate asset (e.g., hybrid energy storage)

Reserve Margin Metric

The reserve margin has been updated to reflect changes to the project list and the 2024 Long-Term Outlook system load forecast.

Supply Cushion Metric

The forecast supply cushion has been updated to reflect the new time period and updated using the 2024 Long-Term Outlook Alberta Internal Load forecast.

Two-Year Probability of Supply Adequacy Shortfall Metric

New values for the metric have been calculated with Total Energy Not Served equaling 0.00 MWh. This value is below the 2,088 MWh threshold. The forecast Probability of Supply Adequacy Shortfall has been updated to reflect the new time period and updated using the 2024 Long-Term Outlook Alberta Internal Load forecast.

New Generation and Retirements Metric

The new generation and retirements metric has been updated to reflect generation project changes since the previous LTA.

Reserve Margin Metric

The Reserve Margin Metric, shown in Figure 1, presents a comparison of generation supply and demand in Alberta. It is a calculation of the firm generation capacity at the time of system peak that is in excess of the system annual peak demand, expressed as a percentage of the system peak. Information on the annual peak demand within the reserve margin can be found on the Alberta Electric System Operator's [Forecasting](#) web page. Firm generation is defined as installed and future generation capacity, adjusting for seasonal hydro capacity and behind-the-fence demand and generation, and excludes wind and solar capacity. Three forecast reserve margins are presented, each with different future supply additions. The supply additions correspond to the stage of the generation projects in the New Generation Projects and Retirements Metric. The metric is graphed with and without intertie capacity in one reserve margin since full import capability may not always be available at the time of system peak demand.

Figure 1: Alberta Interconnected Electric System (AIES) Reserve Margin, 2016 – 2030

Supply Cushion Metric

The Supply Cushion Metric provides visibility of the Alberta Internal Load's ability to meet peak demand daily. The supply cushion is the difference between the daily available firm supply minus daily peak demand. Only existing generation and projects that have met project inclusion are used within the metric. The supply cushion refines the reserve margin calculation by using daily peak rather than annual and incorporates planned outages. Figure 2 presents the estimated daily supply cushion for the next two years. Figure 3 presents daily peak demand and firm supply by fuel type, as well as interties, wind and solar which are not included in the supply cushion calculation due to the intermittent or uncertain nature of the supply. When the supply cushion is negative in Figure 2, there is an increased level of reliance on interties and wind, as indicated in Figure 3.

Figure 2: Alberta Internal Load (AIL) Daily Supply Cushion, August 1, 2026, to July 31, 2028

Outage information as of July 22, 2026

Figure 3: Alberta Internal Load (AIL) Daily Peak Demand and Available Supply August 1, 2026, to July 31, 2028

Outage information as of July 22, 2026

Two Year Probability of Supply Adequacy Shortfall Metric

The Two-Year Probability of Supply Adequacy Shortfall Metric is a probabilistic assessment of encountering a supply shortfall over the next two years. It builds on the Supply Cushion Metric by incorporating the probability of wind production, forced generation outages and generation derates into the calculation of hourly firm supply. The calculation estimates, on a probabilistic basis, how much load may go without supply over the next two-year period. Based on extensive consultation with stakeholders, when this unserved energy exceeds **2,088 MWh** (consistent with ISO rule 202.6, Section 5(1)), the Alberta Electric System Operator may take certain actions to bridge the temporary supply adequacy gap while maintaining investor confidence in the market. The total energy not served shown in Table 2 does not reach the threshold.

Table 2: Two Year Probability of Supply Adequacy Shortfall, August 1, 2026, to July 31, 2028

Worst Shortfall Hour (MW)	# of Hours in Shortfall	Total Energy Not Served (MWh)
0.000	0.00	0.000

New Generation Projects and Retirements Metric

The New Generation Projects and Retirements Metric is a summary of generation at various stages of development in Alberta and is shown in Tables 3 to 6 below. In Alberta's deregulated electricity market competitive forces determine the location, magnitude, and timing of new generation additions. Information on prospective generation additions and retirements provides context for the future market in Alberta. The information is drawn from a variety of public sources and includes new generation, changes to existing generation and the retirement of generating units. Changes in project in-service dates (ISDs) and regulatory stages occur as projects move forward and/or market conditions change. Current information on connection project "ISDs" can be found in the [Alberta Electric System Operator Project List](#) and information on power plant applications can be found at the [Alberta Utilities Commission](#) website.

Table 3: Generation Projects Which Have Met Project Inclusion Criteria

Note: The inclusion list parameters remain aligned with the pre-cluster definitions (i.e., Effective System Access Service Agreement).
